R E P O R T.

THE SELECT COMMITTEE appointed “to enquire into the **FINANCE** and **FINANCIAL ADMINISTRATION** of **INDIA** ;”—**HAVE** considered the matters to them referred, and have agreed to the following **REPORT** :—

1. **YOUR** Committee have thought it desirable to proceed with their enquiry in the order of the Receipt and Expenditure, as shown in the Accounts of the Government of India referred to the Committee, before entering into the consideration of the more general questions affecting the Finances of India ; they have accordingly examined numerous witnesses conversant with the various branches of the revenue of India, from whom information has been derived respecting the circumstances under which the revenue of India has been raised to its gross amount of 50,901,081 £. shown in the Account for 1869-70 ; the conditions under which it is collected ; and the contingencies which may influence its amount in future.

2. Your Committee find it impossible in the present Session to conclude this branch of their investigation, or to proceed with the enquiry respecting the nature of the expenditure and its relations to the revenue, and they therefore recommend that the Committee be re-appointed at the commencement of the next Session to proceed with the enquiry.

3. Your Committee have, however, been much impressed with the evidence which has been laid before them respecting the directions which were given by the Secretary of State for India in Council, in the year 1862, to extend the system of permanent settlement of the land revenue prevailing in some of the Bengal provinces to other parts of India.

4. They have not yet been able to receive the evidence of those by whom the directions were either recommended or issued. Whilst, therefore, they abstain from expressing any opinion on the question, they think it right that the attention of the Secretary of State for India in Council should be called to this evidence, in order that he may reconsider the subject, and, in the meantime, determine whether steps should not be taken to suspend any further proceedings to carry out the Despatch of his predecessor.

5. Your Committee have found that the evidence presented to them is, in some respects, wanting in precision, in consequence of the accounts in India not having been prepared in such a manner as to show the results which should be known to enable a judgment to be formed on important questions affecting the finances. Your Committee therefore recommend that instructions should be given by the Government of India to some competent officer to ensure statements of account being prepared on a uniform basis, and in sufficient detail, by the officers of account for each of the subordinate governments, with exact explanations of important changes of system, and of the causes of increase or decrease of amounts in each case, for the year 1856-57, and the years 1869-70 and 1870-71, in order that these statements may be laid before the Committee at the beginning of the next Session.

6. The questions which have been put to the witnesses already examined, and their replies, will sufficiently indicate the nature of the accounts required, and the Estimates laid upon the table of the House for the Naval, Military, and Miscellaneous Civil Expenditure both for the Effective and Non-effective

Services by Her Majesty's Government, will explain the extent to which information is afforded to the House of Commons respecting the public expenditure.

7. Your Committee also desire that in all cases where the Indian Government has embarked in any special enterprise, such as harbours, railways, irrigation, and other public works, telegraphy, transport, and banking, a balance sheet for the past two years, at least, should be prepared, manifesting the sources of income and the expense as charged under the various heads of the accounts of general expenditure; also statements showing, for a suitable series of years, the amount of capital expended and the balance of profit or loss.

8. Your Committee are further of opinion that it would facilitate their investigations if the officer by whom the preparation of the desired statements of accounts is supervised, should personally bring them before the Committee, to give whatever explanation may be required.

9. It will be observed that the evidence already taken has been chiefly derived from official sources, but your Committee would be glad to receive the evidence of any inhabitant of India, whether of Indian or European extraction, who may desire to appear before them for the purpose of giving accurate and useful information, which, by its comprehensive intelligence, may be likely to assist the Committee in their enquiries and future deliberations.

18 *July* 1871.

PROCEEDINGS OF THE COMMITTEE.

Thursday, 16th March 1871.

MEMBERS PRESENT:

Mr. Grant Duff.	Mr. M'Clure.
Mr. Hermon.	Mr. Lyttelton.
Mr. Fawcett.	Mr. Candlish.
Mr. Birley.	Mr. Cross.
Sir C. Wingfield.	Mr. Ayrton.
Mr. Dickinson.	Sir D. Wedderburn.
Mr. Denison.	Mr. Crawford.
Sir J. Elphinstone.	Mr. Beach.
Mr. Eastwick.	Mr. Cave.
Sir Thomas Bazley.	Mr. Bourke.
Mr. Baring.	

Mr. Ayrton was called to the Chair.

[Adjourned till Friday, 24th March, at Twelve o'clock.

Friday, 24th March 1871.

MEMBERS PRESENT:

Mr. AYRTON in the Chair.

Mr. Hermon.	Mr. Crawford.
Mr. J. B. Smith.	Mr. Baring.
Sir T. Bazley.	Mr. Birley.
Mr. Lyttelton.	Mr. Beach.
Mr. Eastwick.	Mr. Fawcett.
Mr. Denison.	Mr. M'Clure.
Mr. Grant Duff.	Sir D. Wedderburn.
Mr. Cave.	Sir J. Elphinstone.
Sir C. Wingfield.	Mr. Candlish.

Sir Bartle Frere was examined.

[Adjourned till Tuesday next, at Twelve o'clock.

Tuesday, 28th March 1871.

MEMBERS PRESENT:

Mr. AYRTON in the Chair.

Mr. M'Clure.	Mr. Birley.
Mr. J. B. Smith.	Mr. Beach.
Sir T. Bazley.	Sir J. Elphinstone.
Mr. Lyttelton.	Mr. Cross.
Mr. Eastwick.	Mr. Hermon.
Mr. Denison.	Mr. Bourke.
Mr. Grant Duff.	Sir C. Wingfield.
Mr. Cave.	Mr. Fawcett.
Mr. Dickinson.	Sir D. Wedderburn.

Sir Bartle Frere and Mr. Mangles were severally examined.

[Adjourned till Friday next, at Twelve o'clock.

PROCEEDINGS OF THE SELECT COMMITTEE

Friday, 31st March 1871.

MEMBERS PRESENT:

Mr. AYRTON in the Chair.

Mr. J. B. Smith.
Mr. Eastwick.
Mr. Grant Duff.
Mr. Cave.
Mr. Dickinson.
Mr. Birley.
Mr. M'Clure.
Sir C. Wingfield.

Sir T. Bazley.
Mr. Beach.
Sir David Wedderburn.
Mr. Hermon.
Mr. Cross.
Mr. Lyttelton.
Mr. Fawcett.
Mr. Fowler.

Sir *Robert Montgomery* and Mr. *R. A. Dalyell* were severally examined.

[Adjourned till Tuesday, 18th April, at Twelve o'clock.]

Tuesday, 18th April 1871.

MEMBERS PRESENT:

Mr. AYRTON in the Chair.

Mr. Fawcett.
Mr. J. B. Smith.
Mr. Denison.
Mr. Lyttelton.
Sir D. Wedderburn.
Mr. Bourke.
Mr. Birley.

Mr. Grant Duff.
Sir J. Elphinstone.
Sir Charles Wingfield.
Mr. Beach.
Mr. Dickinson.
Mr. Eastwick.
Mr. Cave.

Mr. *J. H. Morris* and Sir *A. Phayre* were severally examined.

[Adjourned till Friday next, at Twelve o'clock.]

Friday, 21st April 1871.

MEMBERS PRESENT:

Mr. AYRTON in the Chair.

Mr. Fawcett.
Mr. J. B. Smith.
Mr. Lyttelton.
Mr. Grant Duff.
Mr. Cave.
Sir Charles Wingfield.
Mr. Beach.

Sir T. Bazley.
Mr. Bourke.
Sir D. Wedderburn.
Sir J. Elphinstone.
Mr. Denison.
Mr. Hermon.
Mr. Dickinson.

Sir *R. Montgomery* and Sir *Charles Wingfield* (a Member of the Committee) were severally examined.

[Adjourned till Tuesday next, at Twelve o'clock.]

Tuesday, 25th April 1871.

MEMBERS PRESENT :

Mr. AYRTON in the Chair.

Sir. T. Bazley.	Mr. Grant Duff.
Mr. Dickinson.	Mr. Bourke.
Mr. J. B. Smith.	Mr. Hermon.
Mr. Lyttelton.	Sir J. Elphinstone.
Sir David Wedderburn.	Mr. M'Clure.
Sir Charles Wingfield.	Mr. Candlish.
Mr. Beach.	Mr. Cross.
Mr. Fawcett.	

Sir Charles Wingfield (a Member of the House), Mr. Phillimore, and Dr. Cleghorn, were severally examined.

[Adjourned till Friday next, at Twelve o'clock.]

Friday, 28th April 1871.

MEMBERS PRESENT :

Mr. AYRTON in the Chair.

Mr. J. B. Smith.	Mr. Denison.
Mr. Grant Duff.	Mr. Dickinson.
Sir James Elphinstone.	Mr. Fawcett.
Mr. Candlish.	Sir D. Wedderburn.
Mr. Lyttelton.	Mr. Bourke.
Mr. Beach.	Mr. M'Clure.
Sir Charles Wingfield.	Mr. Eastwick.
Mr. Cave.	

Dr. Cleghorn and Mr. Secombe were severally examined.

[Adjourned till Tuesday next, at Twelve o'clock.]

Tuesday, 2nd May 1871.

MEMBERS PRESENT :

Mr. AYRTON in the Chair.

Sir C. Wingfield.	Mr. Lyttelton.
Mr. Birley.	Mr. Cave.
Mr. Duff.	Sir W. Lawson.
Sir T. Bazley.	Mr. Fowler.
Mr. Dickinson.	Mr. Baring.
Mr. Bourke.	Mr. Denison.
Mr. Fawcett.	Sir D. Wedderburn.
Mr. Beach.	Mr. Hermon.
Mr. J. B. Smith.	Mr. Eastwick.
Sir J. Elphinstone.	Mr. M'Clure.

Sir Cecil Beadon was examined.

[Adjourned till Friday next, at Twelve o'clock.]

Friday, 5th May 1871.

MEMBERS PRESENT:

Mr. AYRTON in the Chair.

Mr. Fawcett.
Sir Wilfrid Lawson.
Sir Charles Wingfield.
Mr. J. B. Smith.
Sir T. Bazley.
Mr. Eastwick.
Mr. Fowler.
Sir James Elphinstone.
Mr. Lyttelton.

Mr. Baring.
Mr. Grant Duff.
Mr. Birley.
Mr. Beach.
Sir David Wedderburn.
Mr. Denison.
Mr. Bourke.
Mr. M'Clure.
Mr. Candlish.

Sir Cecil Beadon and Sir F. Halliday were severally examined.

[Adjourned till Tuesday next, at Twelve o'clock.]

Tuesday, 9th May 1871.

MEMBERS PRESENT:

Mr. AYRTON in the Chair.

Mr. J. B. Smith.
Mr. Thomas Bazley.
Mr. Lyttelton.
Mr. Grant Duff.
Mr. Birley.
Mr. Fawcett.
Sir David Wedderburn.
Mr. Beach.
Mr. Bourke.
Mr. Dickinson.

Sir C. Wingfield.
Mr. Baring.
Sir Wilfrid Lawson.
Mr. Eastwick.
Mr. M'Clure.
Mr. Candlish.
Mr. Fowler.
Mr. Cave.
Mr. Denison.
Mr. Cross.

Sir T. Pycroft, Sir Cecil Beadon, and Mr. Pedder, were severally examined.

[Adjourned till Friday next, at Twelve o'clock.]

Friday, 12th May 1871.

MEMBERS PRESENT:

Mr. AYRTON in the Chair.

Mr. Dalrymple.
Mr. Fawcett.
Mr. J. B. Smith.
Mr. Lyttelton.
Mr. Eastwick.
Sir D. Wedderburn.
Sir Wilfrid Lawson.
Mr. M'Clure.
Mr. Bourke.

Mr. Beach.
Mr. Dickinson.
Mr. Grant Duff.
Sir James Elphinstone.
Mr. Cross.
Mr. Denison.
Mr. Cave.
Mr. Fowler.

Mr. W. G. Pedder, Mr. C. W. Ball, and Sir D. F. M'Leod, were severally examined.

[Adjourned till Tuesday next, at Twelve o'clock.]

Tuesday, 16th May 1871.

MEMBERS PRESENT:

Mr. GRANT DUFF in the Chair.

Mr. J. B. Smith.	Mr. Cross.
Mr. Fawcett.	Mr. Dickinson.
Sir Wilfrid Lawson.	Mr. Denison.
Mr. Beach.	Mr. Grant Duff.
Mr. Fowler.	Sir Charles Wingfield.
Mr. Eastwick.	Mr. M'Clure.
Sir David Wedderburn.	Mr. Cave.
Mr. Birley.	Mr. Crawford.
Mr. Lyttelton.	Mr. Hermon.
Sir J. Elphinstone.	

The Committee deliberated as to the course of evidence and the witnesses to be examined.

Mr. *Wigram Money* and Sir *R. Hamilton* were severally examined.

[Adjourned till Friday next, at Twelve o'clock.]

Friday, 19th May 1871.

MEMBERS PRESENT:

Mr. AYRTON in the Chair.

Sir T. Bazley.	Mr. Grant Duff.
Mr. Birley.	Sir J. Elphinstone.
Mr. Fowler.	Mr. J. B. Smith.
Sir Wilfrid Lawson.	Mr. Denison.
Sir David Wedderburn.	Mr. Bourke.
Mr. Eastwick.	Mr. M'Clure.
Mr. Lyttelton.	Mr. Crawford.
Mr. Hermon.	Mr. Cave.
Mr. Beach.	Mr. Fawcett.
Sir Charles Wingfield.	

Dr. *George Smith* was examined.

[Adjourned till Tuesday next, at Twelve o'clock.]

Tuesday, 23rd May 1871.

MEMBERS PRESENT:

Mr. AYRTON in the Chair.

Mr. J. B. Smith.	Mr. Cave.
Mr. Beach.	Mr. Denison.
Mr. Lyttelton.	Mr. Grant Duff.
Sir T. Bazley.	Mr. Eastwick.
Sir Wilfrid Lawson.	Mr. M'Clure.
Mr. Bourke.	Mr. Fowler.
Mr. Crawford.	Mr. Dickinson.
Mr. Birley.	Mr. Cross.
Mr. Hermon.	

Mr. *Cooper*, Sir *Bartle Frere*, and Sir *Rutherford Alcock*, were severally examined.

[Adjourned till Tuesday, 6th June, at Twelve o'clock.]

PROCEEDINGS OF THE SELECT COMMITTEE

Tuesday, 6th June 1871.

MEMBERS PRESENT :

Mr. AYRTON in the Chair.

Mr. J. B. Smith.	Sir Wilfrid Lawson.

Sir David Wedderburn.
Mr. McClure.
Mr. Candlish.

DRAFT REPORT proposed by the Chairman, read the first time as follows:—

“ 1. Your Committee have examined numerous witnesses conversant with the various branches of the revenue of India, from whom information has been derived respecting the circumstances under which the revenue of India has grown up to its present amount of 50,901,081 L.; the conditions under which it is now collected, and the contingencies which may influence its amount in future.

“ 2. Your Committee find it impossible in the present Session to conclude this branch of their investigation, or to proceed with the inquiry respecting the nature of the expenditure and its relations to the revenue, and they therefore recommend that the Committee be re-appointed in the next Session to proceed with the inquiry.

“ 3. Your Committee have, however, been much impressed with the evidence which has been laid before them respecting the directions which were given by the Secretary of State for India in Council, in the year 1862, to extend the system of permanent settlement of the land revenue prevailing in some of the Bengal Provinces to other parts of India.

“ 4. They have not yet been able to receive the evidence of those by whom the directions were either recommended or issued. Whilst, therefore, they abstain from expressing any opinion on the question, they think it right that the attention of the Secretary of State for India in Council should be called to this evidence, in order that he may reconsider the subject, and, in the meantime, direct that no steps should be taken to give effect to the Despatch of his predecessor.

“ 5. Your Committee have found that the evidence presented to them is, in some respects, wanting in precision, in consequence of the accounts in India not having been prepared in such a manner as to show the results which should be known to enable a judgment to be formed on important questions affecting the finances. Your Committee therefore recommend that instructions should be given by the Government of India to some competent officer to ensure statements of account being prepared on a uniform basis, and in sufficient detail, by the officers of account for each of the subordinate Governments, with exact explanations of important changes of system, and of the causes of increase or decrease of amounts in each case, for the years 1869-70 and 1870-71, in order that these statements may be laid before the Committee at the beginning of the next Session.

“ 6. The questions which have been put to the witnesses already examined, and their replies, will sufficiently indicate the nature of the accounts required, and the Estimates laid upon the Table of the House for the Naval, Military, and Miscellaneous Civil Expenditure by Her Majesty's Government, will explain the extent to which information is afforded to the House of Commons respecting the public expenditure.

“ 7. Your Committee also desire that in all cases where the Indian Government has embarked in any special enterprise, such as telegraphy, transport, and banking, a balance sheet, for the past two years, at least, should be prepared, manifesting the sources of income and the expense, as charged under the various heads of the accounts of general expenditure; also, statements showing, for a suitable series of years, the amount of capital expended and the balance of profit or loss.

“ 8. Your Committee are further of opinion that it would facilitate their investigations if the officer by whom the preparation of the desired statements of accounts are supervised, should personally bring them before the Committee, to give whatever explanation may be required at the commencement of the next Session.

“ 9. It will be observed that the evidence already taken has been chiefly derived from official sources, but your Committee would be glad to receive the evidence of any inhabitant of India, whether of Indian or European extraction, who may desire to appear before them for the purpose of giving accurate and useful information, which, by its comprehensive intelligence, may be likely to assist the Committee in their inquiries and future deliberations.”

Motion .

Motion made, and Question, That the Report be now read a second time, and considered paragraph by paragraph,—put, and *agreed to*.

Paragraphs 1—9, amended, and *agreed to*.

Amendment proposed, to add the following new paragraph to the proposed Report—(Mr. Fawcett).—

“Your Committee have reason to believe from the evidence given by the Controller General of the Finances at Calcutta, by the Financial Secretary to the Home Government, and other witnesses, that many items of receipt are put down to income which ought properly to be considered as capital, and to be devoted to the reduction of debt. In the year 1869–70, when there was a supposed surplus of 118,000 £., items amounting in the aggregate to more than 1,200,000 £. were thus devoted to income, instead of being regarded as capital. The Controller General admitted, in reference to these facts, that instead of there being a surplus of 118,000 £., there was a very considerable deficiency. Considering that the debt of India, without including the railway loans of 80,000,000 £., upon which the Government has guaranteed 5 per cent., has increased by 70 per cent. within the last 12 years, it is especially important that in future no revenue should be devoted to ordinary income which can be properly regarded as representing capital. It is manifest that if such an appropriation is permitted as that which took place in the year 1869–70, no accurate idea of the true financial position of India can be formed either from the public accounts, or from the financial statements made to Parliament and to the Legislative Council of Calcutta. The Committee would recommend that, previous to the re-appointment of the Committee next Session, the revenue receipts should be examined during the last 12 years with the view of indicating those items devoted to income, which ought to have been appropriated to capital.”

Question put, That the proposed paragraph be added to the Report.—The Committee divided:

Aye, 1.
Mr. Fawcett.

Noes, 9.
Mr. J. B. Smith.
Mr. Candlish.
Mr. Lyttelton.
Mr. Eastwick.
Mr. Bourke.
Mr. Grant Duff.
Sir C. Wingfield.
Sir D. Wedderburn.
Mr. McClure.

Question, That this Report, as amended, be the Report of the Committee to the House—put, and *agreed to*.

Ordered, To Report, together with the Minutes of Evidence and an Appendix.

EXPENSES OF WITNESSES.

H. B. E. Deccan?—I should begin with Kandeish, which is lower than the rest of the country and rather different from it, but which is included in the general name of the Deccan; then Ahmednugur, Nassick, Poonah, Sholapoor, and Sattara. Throughout all this territory you find generally some remains of the early Hindoo revenue systems; but the most prominent features which have existed to the present day are those of some of the early Mahomedan settlements, and they have been very much modified by the different systems which prevailed under the Mahrattas during the last century and a-half of their rule.

12. Immediately preceding the British occupation?—Yes. There is no record of the original division of this country into villages, which may be compared to English parishes, and which form the unit of settlement in most parts of the country; but throughout the whole country which is occupied by the Mahrattas one principal feature has always been the tendency to deal with the land in small portions, as fields, or some portion which is smaller than the village or the parish, as I may call it.

13. Has their tenure been regulated by the particular custom of the individuals owning them?—It is a habit of the country, of which it is very difficult to trace the origin; but the people throughout the Mahratta country have an inveterate dislike to be doubled up each with his neighbour. In that respect they are a remarkable contrast to the population in other parts of the country, who rather affect being dealt with in large communities as brotherhoods.

14. Does that lead to the assessment of each plot of land, however indicated, separately for the land revenue?—Yes.

15. And what is the machinery for making that settlement of the land revenue?—The most important part of the machinery consists of village officials. In a perfect village, according to theory, there would be twelve of them, including artisans, but those who are of importance to the revenue are the head man, who is called a Patell, the notary public or Koolkurnee as he is called, and the Mhar, who appears to be the descendant of one of the races who affect to be, and assert themselves to be, Autochthones, and he knows all about the boundaries of fields and estates, and is a very important personage in the village community, though he is a helot and is not allowed to live in the village, but is kept in a little hamlet outside.

16. That is to say they were the inhabitants before the Brahminical or Hindoo invasion of the country?—Yes.

17. Will you explain in what respect this primary organisation differs in other districts of Western India from that which you have described?—In most districts with which I am acquainted there is some trace of a similar organisation having existed in former days, but certainly in many it has been obliterated, sometimes by over-assessment, sometimes by over-centralisation, and sometimes by war and famine. I now proceed to mention how these people collect the revenue. At the commencement of the official year each cultivator is informed of the amount due by him as the assessment of the land he holds, and this he is summoned to pay by fixed instalments, at the bidding of the mhar who acts as village messenger and servant of the head man; he is bound to pay it to the head man and the notary public, and they are bound to give

him a receipt for it, and to enter what he pays in the accounts. The sum so paid is then handed on to the district treasury. The district generally comprises from 20 or 30 to 100 or more villages; and from that treasury it reaches the collector's treasury, and is brought on the general accounts of the Government there.

18. Are there superintending officers of the revenue of a higher grade coincident with these collections?—Yes; up to the district establishment they are generally native officials. Each collectorate is presided over by one European collector, who has generally one or two European assistants.

19. Will you explain in what respect the system differs in the Concan, which I understand to be the district between the Deccan and the sea?—It is a low-lying district, moist, and with a very heavy rainfall, and a good deal of rice is generally cultivated. Wherever the water can be got to remain for any time upon the surface, all the flat portions are cultivated with rice. The revenue system there is generally very much like that in the Deccan, with such exceptions as are occasioned by the difference in seasons; the difference between a dry crop, dependent upon showers of rain at distant intervals, and what is contingent upon a rice crop, which requires very heavy rain for some months continuously. But a portion of the Concan, the southern portion, was farmed out by some of the later Mahratta sovereigns to farmers, chiefly Brahmins, who were supposed to belong particularly to that part of the country; and to have particular claims from considerations of religious sanctity, and they are generally known as the Kotes.

20. The Government deals with them, then, for the purposes of assessment and collection?—As middlemen for purposes of collection, and they cause a considerable modification in the system which I have just been describing.

21. With regard to Bombay and Salsette Island, are there any special circumstances?—They were for a long time in the possession of the Portuguese, and have been longer than any part of India in the possession of the English; and there you find very considerable traces of old Portuguese tenure, and still more of modern English tenure.

22. In the Southern Mahratta country, and Canara, the district between that and the sea, is there any difference?—The Southern Mahratta country resembles the Deccan geographically, but it is not considered to belong to the Deccan, because it is south of the Krishna, which is the limit of the Deccan, and it is inhabited principally by Canarese, who are one of the southern races of India and very different in their physical and intellectual habits from the Mahrattas. They are very industrious, skilful cultivators, and are altogether a very fine race. Their system has been also modified by a great portion of the country having fallen under the dominion of Tippoo, the Sultan of Mysore, who modified the system which was previously in force.

23. Was it further modified on our acquisition of that territory?—It was dealt with in most respects very much like the rest of the country, but it was at first under Madras, and it had the advantage of being for some time directed by the traditions of Sir Thomas Munro, and that gave rise to some differences of management which have, however, nearly disappeared by this time.

24. Then is the settlement of the land revenue made

made direct with the owners and occupiers?—The settlement is made on the same system now as with the rest of the Deccan.

25. What is the state of the land revenue in Guzerat?—Guzerat is one of the richest and most civilised portions of Western India. It appears to have been from an early period divided among separate Hindoo sovereigns, who in some cases have managed to keep up their separate independence to the present time. There is a greater variety of population in that province than in almost any country I know, and a consequent greater variety of tenure. There is also a considerable variety in the physical aspect of the country. There are some very rich plains, and some very dense, unhealthy jungles; and the jungle portion is only being very slowly brought under cultivation, as the population extends.

26. What is the result at the present time, of the various systems that have prevailed there under the different rules with regard to the settlement and collection of land revenue; is it there made with the owners of villages chiefly or with the owners of particular fields and particular allotments?—It is made in almost every mode in which it is possible to make a settlement; in some villages you find it made field by field with independent cultivators who would throw up their estates and refuse to cultivate altogether if any attempt were made to bind them up with their neighbours; perhaps in the very next village you will find inhabitants of a different origin and of different habits, who would on no account, if they could help it, allow any interference with their field divisions, and who insist upon paying in a lump through one head man; and in some parts of the country the settlement is made with descendants of ancient sovereigns who have fallen into the position of great landholders and nobles.

27. Then that arises from Guzerat having been so frequently invaded and administered from time to time by conquering races?—Yes.

28. Traces of the old system still remain in some and have been obliterated in others?—Yes; in one district called Kattywar during the early part of the present century, the dues which we inherited from the Peishwah's were collected by what was called a system of Moolukgerce, *i. e.*, a system of military promenades through the country, in which the Peishwah's officer managed to take from each chief or community as he passed as much as they chose to pay, and they never paid except on some demonstration of force; it was a point of honour always to fire a shot in the way of resistance; and to that sort of very miscellaneous system of assessment and collection we succeeded at different periods during the present century.

29. Has it been the principle of the Government always to search out the person who is considered the owner of the holding, and to make a settlement with him, so as to get into a more regular method?—As far as possible; and it is in that respect that I think the Bombay system has been peculiarly successful. It has generally managed to get nearer the man who, by common consent of his neighbours, was looked upon as the proprietor of the land.

30. Will you be good enough to state when the Government systematically undertook the settlement by what is called the revenue survey of Bombay; that is to say, the re-settlement of the country for the purposes of land revenue; what has been done with a view of dealing with

this state of things which you have described more methodically by survey and settlement?—

The Committee would understand that systems such as I describe were not such as it was possible to administer through the agency of foreigners, and especially of Englishmen, trained as Englishmen are, to look for a rule and a law in all matters of public assessment; and from the first time when we got any territory in Western India, attempts were made to fix, by survey and assessment, the demands of the Government from the land. Sometimes the Government found the records of former governments extremely perfect and detailed. The Mahrattas were great hands at keeping very good accounts for the Government, and they had a system of assuming that everything within a province must be accounted for; a provincial account of the whole landed property of the province. Then follow the deductions, estates that have been alienated, feudal and ecclesiastical, and so on, and all deductions which were made for service, assignment for troops, and so on.

31. That is to say, for lands held in recompense for services to be performed to the State?—Yes; and at the end come out the public estates which pay a fixed money or grain assessment to the Government. The accounts of a Mahratta provincial governor, when you can get them perfect, show most clearly the whole state of property during his reign, and the way in which the Government dues were levied and accounted for. In some cases, especially in Guzerat, it was hardly necessary to do more than to get these accounts, where they had been carefully kept, and give the collector a good map of the district, and he was able to get on for some time. But in the Deccan it was found that a system of rack-renting, which had grown up during the time of the later Peishwahs, had so far superseded what were considered the good settlements of former rulers, that it was almost impossible for a collector to see his way to a reasonable settlement.

32. You mean that what may be called the land revenue had, from the continued growth of extortion under the later Mahratta rulers, approached the rack rental of the land?—It had often been raised to something more than the rack rental, and it was generally necessary before you could levy the revenue to give large annual remissions. These caused great speculation, and oppression of various kinds, and nothing could be worse than the state of the country as regarded the levy of the land assessment when the first attempts at survey were made. The first surveys were intended to be extremely minute. An attempt was made, after registering the land, to arrive at a precise idea of the gross produce, and then to make a deduction for all the expenses of cultivation, and then to take a fixed share of the net produce as the revenue of Government. But it was found in practice that this was entirely a misleading and impossible mode of assessing the revenue. There were so many disturbing elements, and there were so many elements in which any one small mistake got magnified in the result, that the most absurd additions and diminutions of the existing revenue were the result of the arithmetical process; and after a good deal of money had been spent upon this kind of survey, the Government was obliged reluctantly to revert to something like the old system about the time that I went out to India in 1834. This had led to

terrible oppression in one or two villages, oppression so serious as to attract the attention of Sir Robert Grant, the then Governor of Bombay, to it, and he sent Mr. Goldsmid, to whom I was attached as assistant, and Captain Shortreed, to report upon the system; and the result of their report was an order for a survey and an assessment upon a different system, which was entrusted to Lieutenant Wingate, now Sir George Wingate.

33. Will you now describe what the system was which was then adopted for assessment?—It is a system which has been since adopted and carried out, and which has been the model of a good deal of the re-settlement of other parts of India.

34. That is still in force?—That is now still in force and still going on. It commenced with a demarcation of the boundaries of fields, and inasmuch as in very few parts of the country were there any hedges, this matter of boundaries was one of capital importance to the permanence of the settlement. After the fields were marked out, and the boundaries ascertained to be such as might be relied on during a series of years, the measurements were made by a separate measuring establishment.

35. Was this, in any respect, done under an Act of the Legislature of India?—It was done under the general powers which were given by the Regulations of 1827 to the Government of Bombay to assess the revenue, and there was no Act passed to legalise their operations till about six years ago. This Survey Assessment was begun in 1835 and 1836. After the measurements were completed, a separate establishment of carefully trained and selected men were sent through the fields to classify the soils. They dug up the soil to the depth of a foot or two, and classified each patch of land according to the opinion they formed of the soil. These classifiers had nothing to do with the assessments; they merely reported that the soil was of such a quality, and such a depth. After the whole of the district had been gone through, the European officer in charge of the proceedings, with the best advice which he could get from those who were experts in the matter, decided what assessment it would be fair to fix upon each class of soil; and he then reported the result to Government. If Government were satisfied with the care and judgment shown in his operations, the assessments resulting from this process were declared permanent for 30 years.

36. Then in fixing this assessment he looked to what may be called the intrinsic value of the soil, and it was assessed quite independently of the interest of the man using it?—He was always entitled to abatement for anything that he could show was not intrinsic in the soil, but was due to his own labour; careful records were made of the result, and village maps showing each field were drawn out in the native language; latterly these have been printed, and multiplied by lithography and photo-lithography, and now it is in the power of every one of these cultivators in a recently settled district to have a map showing his own estate in his own language.

37. Then the person with whom the assessment was made under the new system was still the person whom the Government, or public opinion, or the law regarded as the owner of the land?—Yes; shares and rights in the land were recorded when application was made; the thing was done

as deliberately as possible, and every opportunity given to record such rights.

38. You mean rent-charges and so forth on the land payable to particular individuals?—Yes; rent charges and also shares which did not admit of being shown on the map or in the record for assessment; they were recorded to avoid disputes afterwards.

39. Where the land was held in joint tenancy?—Yes; where the land was held in joint tenancy by partners.

40. What was the effect of this settlement as it proceeded upon the cultivation and use of the land, and on the revenue?—The effects on the revenue were at first a considerable reduction in the demand, because the original assessments had been rack rents or something more; but in almost every case there was an immediate increase of net receipts, owing to the extension of cultivation, and the full realisation of the demand; in the first settlements waste lands were marked out and measured out, and were taken up gradually as the people applied for them, and this increase of cultivation in almost every instance led to an immediate increase in the net revenue derived from each district.

41. Then the lands at the time of the survey which were unoccupied or unowned, if I may use the phrase, were equally surveyed, and an assessment value was put upon them, so that anyone might take them on the condition that he should pay that revenue?—Yes; occasionally also there were rights of ownership which from poverty could not be claimed by a man taking the land at the time; they were always recorded, and the original owner was encouraged, as far as possible, to take the land which he claimed as his own, and his right in it was registered if it was recognised by all the villagers and bystanders round at the time of the settlement.

42. Then land that was not occupied or owned was opened to the first applicant to Government, on the terms of paying the settlement that had been made for it?—Yes.

43. Did that lead to a great many applications to take up the land?—It led to a run upon the land in a great many cases; the efforts the people made to secure the right to cultivate the land were such that they rather exceeded their means of cultivation.

44. Was everybody let into possession, as what we should call a freehold owner of the land, subject to the payment of the land-tax?—Yes; I might illustrate the effect by referring to the first district, which was dealt with in this way: It was a district of which the nominal rental was about 15,000*l.*; the net receipts had for some time been less than 4,000*l.*; the rental was reduced to about 8,000*l.*, and the net collections the first or second year amounted up to 7,000*l.*; a rise from less than 4,000*l.* to 7,000*l.* of actual receipts into the treasury. In the second or third year afterwards the whole available land was taken up, and has so continued ever since.

45. That originally resulting from the improvement in the cultivation and the taking up of the land, consequent upon the definition or settlement of the revenue?—Yes, that was an extreme instance; but it was a specimen of what was more or less observable throughout all the survey operations. The results have been since, an immense increase in agricultural stock in every surveyed district.

46. Can you state how far this survey and settlement

settlement has proceeded in Western India?—It has been carried out throughout almost the whole of the Bombay Presidency. There remain to be done a few districts in Gujerat, a few districts in Scinde, one or two in Southern Concan, and some in North Canara, which has been lately transferred from Madras.

47. But is there any intention to apply the survey to those districts?—It is in progress now in all of them; but the work is very carefully done, and the process is not a quick one.

48. In fact, it has taken these 30 years to carry out?—Yes.

49. So that now you have arrived at the point where the revision would have to begin again?—Yes, it has begun again in one or two districts; and in those districts the people have voluntarily consented to a very considerable increase in the assessments which were fixed at the last survey.

50. On what principle is the increase made on the revision of the settlement?—Generally by looking at the difference in the price of grain. When the matter was discussed, shortly before I left Bombay, with some of the cultivators in the districts which were liable to re-assessment by the expiry of the old settlement, they seemed universally to consider that the difference in the price of grain was the proper measure of the increase which they might be justly called upon to pay in the assessment.

51. Without entering into the vexed question of the depreciation of the value of silver in India, has there not been an immense change during the last 30 years in the money price of agricultural produce?—Yes, a very great rise in prices.

52. Could you give us any idea of the rise in the different products?—It varies very much, according to means of communication. Where the communications have been much improved I should say it was invariably double. When the communications have been less improved, things have more nearly stood still; but I think there has been a general increase throughout the whole of India in the money price of products.

53. Can you state what proportion the increased re-settlement would be in reference to the general increase of value; would it be some relative proportion of that increase?—Yes; in the districts which were most likely to be affected by immediate re-settlement it would vary from 20 to 50 per cent. I may mention, that in some of these districts the prices for some years past have been as high or higher than the famine prices of Bengal or Orissa. But it must not be supposed that the whole of this result is attributable to the survey; a great portion is due to the rise in the price of agricultural produce and to the means of communication, which, though they have been nowhere made what they ought to be, still have been very much improved of late years.

54. As illustrating the question of the rise in price, has there been a corresponding rise in the price of wages of agricultural labour throughout the presidency?—Yes, an immense rise; partly due to such measures as the survey and re-assessment, but the great agency has been, I think, the railway system. I think, broadly speaking, you may say that wherever the railway was near enough to attract labourers it made all the difference between a serf and a free labourer, and freed the peasant generally from debt.

55. But did the Government consider itself

entitled to appropriate the whole benefit of the rise in prices to the revenue, or did it only proceed with a view to taking a proportion of the rise and giving some to the cultivator, and some to the labourer, and some to the owner of the soil?—I do not know that the labourer entered much into the calculation; but Government did not consider that it should take the whole of the increase. It was almost impossible to distinguish how much was due to each of the various causes, but, as far as I saw, the cultivators were quite content with the fact that they got much better prices for every sort of produce, and they were content to let Government have what they considered its fair share of the rise.

56. Was any proportion do you know maintained; that is to say, supposing the prices were doubled would that be a ground for doubling the assessment?—No, not for doubling it, but for a considerable rise in it.

57. Mr. J. B. Smith.] Cannot you say what proportion was observed?—It varied very much; I do not think there was any fixed proportion.

58. *Chairman.*] I was endeavouring to ascertain whether any rules have been laid down by the Government of Bombay for the direction of the re-assessment officers, to guide them upon some principles of policy in the re-assessment, of which there is any minute or formal record?—No; and I do not think it would be desirable to fix any; for this reason, that the success of these arrangements has generally been due to the people being always consulted and allowed to have a voice, and being heard when they considered that the Government was too hard upon them; and to a considerable extent they have been listened to when they thought themselves aggrieved in a matter of over-assessment; and I am afraid that if you laid down a rigid rule, you would find it would be applied very rigidly, and that the habit of referring to the people would rather fall into disuse.

59. Then we are to consider it as an equitable re-assessment, having regard to all the circumstances present at the moment?—As being equitable in the same sense as you would find a difference in what would be considered equitable assessments in different parts of this country, say, between Lincolnshire and London, or Scotland. In Lincolnshire, I believe the farmers consider that they have a right to a considerably larger share of the produce than would be considered reasonable in the neighbourhood of London or in Fifeshire; and you find in dealing with the natives of India, when you talk with them on a subject of this kind, that they discuss it in exactly the same way, and say that their habit has been always to pay a heavy assessment, or a light assessment; and they will argue the matter very much in the way that an English farmer would.

60. Has any exceptional method been adopted in dealing with what are called the hill tribes, the aboriginal tribes, of India?—They generally cultivated on a system of their own; they either paid so much for a plough, or still oftener so much for the billhook with which they cut down the jungle; it was impossible to measure fields which were very often in an inaccessible jungle, and very rough modes of assessment were adopted with regard to them; it has been a great object to settle these tribes and bring them to habits of regular cultivation; they have consequently (under the Survey) been dealt with quite exceptionally,

Sir H. B. E.

1871.

Sir H. B. E. ceptionally, and with great regard to their own
Freie, K.C.B., customs and the modes of assessment which they
O.C.S.I. considered easy and reasonable.

24 March
1871.

61. Do they occupy a considerable space in Western India in point of territory?—In some parts, as, for instance, in Kandeish and on the skirts of Gujerat, they occupy the whole of the jungle part of the hill country; in other parts they are found scattered about, but traces of them are to be found in almost every district.

62. Is it generally the case that the hill country in Western India is not in the same condition as what may be called the plain country, and is in a very primitive state?—Yes; the invading tribes, who were more civilised than those they invaded, generally seized upon the richer parts of the country, the low lying cultivated valleys, and the indigenous tribes were driven to the hills and the accessible jungles.

63. Is it their practice to shift their cultivation, burning or otherwise clearing the land, then using it for a short time till it is exhausted, and then breaking up other land?—Yes.

64. It, therefore, does not admit of the same regular treatment as the land that is in regular cultivation?—No.

65. Were any special charges added to the land revenue at the settlement?—There was a part of Sir George Wingate's original plan, which, was devised, I believe, by Colonel Davison, for imposing an extra cess at the rate of one anna in the rupee, that is one-sixteenth of the assessment, which was to be applied to the formation of roads and the maintenance of schools; the schools were to be of two kinds: schools for primary instruction in reading and writing; and schools in which mechanical art would also be taught, so as to improve the mechanical arts of the country. This system was a little in advance of the ideas of the Government at the time, and it was postponed for some years, and has only been latterly and very gradually introduced, as the people were found to wish for it and to be inclined to accept it.

66. Did the land law of Western India or the Bombay Presidency reserve the right of the Government to make any further special assessment to meet emergencies of the State?—Yes, there was a special reservation in the Regulations of 1827 for the purpose.

67. That, legislatively, there might be a general new tax put on?—Yes.

68. Then this cess would be a tax of that nature?—It would be a tax of that nature; it was deferred in some parts from an idea that it would be considered by the people as a breach of the covenant made with them during the 30 years' settlement; and where nothing was said about it at the time of the introduction of those settlements, its introduction was postponed; but in all new settlements it is made a part of the original settlement, and has the same force as the Government assessment.

69. What legislation then has taken place affecting the assessment and condition of the land under the systems which you have described?—The first regulations on the subject were, I think, in 1798, when a very elaborate report was drawn up on the land tenures of Salsette and a few villages on the mainland, which at that time formed the whole of the Presidency of Bombay; this report, with an indication of the course which Government meant to pursue, was declared law; it was very much in the form of what would be a

report of a committee of inquiry, with the Resolutions of Government appended to it.

70. That constituted a complete land code for the Presidency of Bombay as then existing?—Yes, a complete history of the land tax and a code of regulations for dealing with it; then various regulations were passed at different times, as additions were made to the presidency by cession from the Mahrattas; and when the whole of the Deccan was added to Bombay, with other territories of the Peishwahs which were conquered in 1817 and 1818, a fresh set of rules were drawn up by a commission appointed by Mr. Mountstuart Elphinstone, and a very good code of regulations adapted to the then condition of the country was framed and passed into law in 1827; which made it imperative upon the fiscal officers to inquire with regard to all questions of land assessment into the local custom, and consecrated the custom of the country as the limit of demand. This, which might seem a very loose mode of procedure, was, in fact, a very considerable bridle upon the Government of the time, and although it afterwards proved insufficient, and it was found necessary to define and bind the Government more strictly in the matter, it was at the time a very great relief to the people, who had always the power to come in and prove that any given demand was not in accordance with ancient custom.

71. In point of fact every one's rights were granted to him or guaranteed to him by law, as against the Government, if he could prove that they had existed for a time that constituted in the opinion of the courts of justice legal usage?—Yes.

72. And people had the right of establishing their claims in a court of law as against the Government freely?—Yes.

73. I suppose that that system has led to a good deal of accurate definition of rights and customs in the courts of law?—Yes, and it has led to a very useful habit of looking to customs rather than to any preconceived theory.

74. Has there been any other special legislation affecting the land revenue since the code of 1827?—About five or six years ago what had been done under the operation of the survey was embodied in an Act which was passed by the Bombay Legislature and assented to by the Governor General, and that is now the law with regard to the land assessment in the surveyed districts.

75. Was the attention of the Government at any time directed to the enormous extent of land which had got altogether exempted from the settlement of land revenue?—Yes, it had always been an object with the Government to look to these large alienations. They were of very different extent and character; some of them were service alienations under different names, Jageer and Serinjam.

76. That is to say lands granted to persons who were to supply troops or to do duties in return for the grant?—Yes, service lands.

77. Were they granted free from land revenue wholly or partially?—They generally were coupled with some obligation to serve with troops; the largest of them were coupled with such an obligation. The number of troops was large or small in proportion to the interest of the grantee at the time, and besides all of these, there were a vast number of smaller grants, some to temples and some for various district and village services.

With

With regard to all of them, it was the habit of the native government to consider that each change of ruler entitled the government to look to the alienations of his predecessor and to make considerable resumptions of those rent-free tures the grants of which were recent, and made from motives of favour; but the resumptions were not found to be oppressive, because there were an equal number, or nearly an equal number, of re-grants. The system was very much like that of some periods in the middle ages, when the power of the Crown was strongest and large numbers of the favourites of the former king had their grants resumed, while the supporters of the reigning sovereign got fresh grants, so that upon the whole the country was pretty well contented. We abolished, as far as possible, or curtailed the system of service tenure, and paid for everything in money, and required all lands, as far as possible, to be paid for in money.

78. Can you give any general idea of the proportion of the land that had thus become exempted from the ordinary revenue to that which was chargeable to the ordinary revenue?—It varied in almost every district. In some districts almost the whole was alienated; in others only a very small portion; but you could hardly say that any two districts were alike in that respect. The smaller alienations were most numerous in the richest districts, in Guzerat for instance, and they were the oldest and were the most respected; many of them had descended for centuries, and there were a very considerable number which went back as far as the time of Charles the Second.

79. But was any estimate made of the total amount of alienation as compared with that which was collected or assessed?—Yes, but it was not very easy to get at any definite money result; because, in the first place, many of these alienations had never been measured or assessed, and the service which was partially rendered for most of them was also very difficult to assess; so that it was not very safe to deal in fixed figures.

80. Can you give us an approximate idea of what it was in the view of Government upon the whole?—Not further than that it was a very considerable deduction.

81. I mean would it amount to a third or a fourth of the whole land revenue, supposing that it had been collected throughout?—Hardly, I should think, as much as that; perhaps a fourth. I should be sorry, however, to pin myself to any fixed proportion.

82. In the definition of the private rights in the land in 1827, was any reservation made of this special question?—There was a proclamation issued at the time the territories were taken over from the Peishwahs, telling the rent-free holders that all that had been enjoyed for a certain period of years would be respected, and the Government fixed what they considered a fair period of prescriptive enjoyment beyond which they would not look. That period has varied at different times, according to the views of different administrations, and nothing was attempted very systematically till, I think, about the year 1840, when the subject was taken up as a whole, principally in consequence of similar questions, which had been raised on the other side of India, in Bengal, and what was called the Inam (or Rent-free Land) Commission was appointed for inquiring into all alienated revenues.

83. Did that commission proceed to examine these exemptions from land revenue?—That

commission first of all took possession of all documents on which exemptions were founded, and then proceeded to investigate the claims district by district, and reported on them to Government. Rules were laid down by Government from time to time as to what they would respect and what they would resume, and, finally, those who were continued in possession received re-grants under the name of the present Government.

84. Is that commission still in operation, or what became of it?—It is partially in operation still, but with very limited powers. Its work was completed about seven years ago, as far as the greater portion of the rent-free land was concerned. Sir George Clerk, then Governor of Bombay, found that a good deal of irritation was caused by inquiring into some of the more doubtful claims to exemption which had been reserved to the end of the inquiry; and he made a rough compromise with the holders, that they should pay a certain per-centage of what the Government demanded, and that they should be freed from further inquiry. The result was exceedingly beneficial in quieting people's minds as to the pushing of the inquiry further than they considered just, and upon the whole the result has been beneficial to the revenue, and also beneficial to the people, as continuing those who have been recognised in the undisturbed possession of their rights.

85. Can you state what has been the general addition to the land revenue of Bombay by means of this process of dealing with the exempted lands?—I could not state it, exactly, without reference. I will supply that.

86. Then may we take it, that so far as the assessment of the land revenue in the Bombay Presidency is concerned, it has reached the maximum of amount?—No, I think that there is a considerable opening for increase as the leases expire.

87. You mean, that when it is re-assessed after the 30 years' leases or settlements expire, you anticipate a general increase?—Yes.

88. Would that be going on during the whole process of the next 30 years, if it takes as long to re-assess?—Yes; I think there is a considerable advantage in the process not being a very rapid one; it gives more time for people to be heard, and more time for correcting mistakes.

89. It would seem that it must take 30 years to do it, because it took 30 years at the beginning, and it is a 30 years' assessment, so that the whole presidency cannot be re-assessed, except gradually, in a period of 30 years?—Exactly so; in a few instances shorter leases were given where it was supposed that the country was in a transition state.

90. Can you state what would be the probable increase of the land revenue, year by year, from the assessment?—It would be impossible to state that, because so much would depend upon prices, but I should say that you might reasonably look for two-thirds of the increase in the price of grain and agricultural produce.

91. Throughout the presidency, as an average?—Yes.

92. You think that the land revenue would get the benefit of that proportion?—I should say at least two-thirds of the increase in prices.

93. And what would you take as an increase in price, generally speaking, as an average?—It depends above all things upon means of communication, I think.

Sir H. B. E.
Frere, K.C.B.,
G.C.S.I.

24 March
1871.

94. The re-examination of the lands that are exempted from revenue is complete, as I understand you?—That is almost complete. There would be a small increase there probably. Many of the exemptions were continued for one life or two lives, and they will fall in, and there will be a small increase in cases of that kind.

95. Has any provision been made, where the exemption is for service, for bringing the land under revenue settlement, in case the service is no longer required, or is that right reserved to the Government?—Generally in all large alienations of the kind the whole of the process of cultivation, assessment and payment of revenue goes on under the holder of the alienation in the same way as it would under Government, and in many cases the settlements have defined what the holders of the rent-free tenure shall have a right to demand from the cultivators, who never give up their right as owners of the land, though they pay to the holder of the rent-free tenure instead of to Government.

96. Do you understand that in all the grants that the Government makes of villages in gross, they reserve the individual rights of the cultivators and define them?—Yes.

97. But in the event of the holder of the land granted, who is to perform the service of furnishing a troop of horse, no longer being required to provide that, has the Government any right to bring his land under assessment and dispense with his service?—It would depend upon the special agreement. The process you describe has been sometimes enforced. If he neglected to keep up his horse in an efficient state he would be told that his horses were not required, and he would be bound to pay so much per horse instead of furnishing a contingent.

98. Do you consider that the Government has the right to dispense with any of the services for which land is granted, or are many of the services hereditary offices or rights that they cannot dispense with if they wished?—In many cases they are hereditary and could not be dispensed with. In every district and village there are hereditary officers who consider themselves bound to serve if called upon, but who do no more service than some of the people who hold lands originally granted on condition of feudal service in this country; they say that they are ready to render the service if required, and they claim to hold their lands.

99. Therefore no increase of revenue would arise from that source?—No; and the same sort of reasoning applies to lands alienated to temples and for ecclesiastical purposes, which are very considerable.

100. Then do you look chiefly for the increase of the land revenue on the re-settlement to the improvement of communications, and otherwise enhancing the general value of produce as the result of cultivation?—Yes.

101. And is there great scope for that in the Presidency of Bombay?—Very great.

102. Would irrigation also be a source of improvement which might lead to the improvement of the land revenue on the re-settlement?—Yes, very considerably.

103. As the result of the present settlement, what do you consider the proportion that the Government receive to the gross return of the land?—It varies certainly in every province, and I should say in most villages.

104. Your view is that the cultivator or owner

having had perfect freedom to cultivate any crop he pleases, and to farm as high as he pleases, the land revenue, depending on the intrinsic value of the land, does not bear a definite proportion to what he gets from the land?—No fixed proportion.

105. Will you state what has been the growth of the land revenue in the Bombay Presidency from that early period when it was limited to Bombay and Salsette; stating the epochs when the increase took place from particular circumstances?—It is entered at 79,025 l. in 1792. It varies from that date, occasionally falling as low as 31,000 l. up to 1803, when there was a considerable accession of territory by treaty cessions in Guzerat, and the land revenue mounted in 1803 up to 305,861 l. It remained at about that amount, rising sometimes above 400,000 l. till 1817, when in consequence of the conquest of the Deccan from the Mahratta Peishwas several districts were added to Bombay, and the land revenue is entered at 868,047 l. Further additions were made from the same source in the next year, raising the land revenue to 1,143,000 l.; and it continued at that amount, rising sometimes to 1,800,000 l., and sometimes falling to 1,208,000 l. In 1842, it touches 2,000,000 l., this must have been partly owing I think to lapses of alienated revenue.

106. You mean that large revenues which had been alienated were beginning to fall in from want of heirs, and some other causes?—Yes.

107. Mr. Beckett Denison.] Would nothing be due to the conquest of Scinde?—That, I think, does not appear till much later.

108. Chairman.] Perhaps you will add the subsequent increase down to the present time?—Yes; I will furnish that.

109. Mr. Care.] Did you state that the Government makes an agreement with individual cultivators, field by field?—Yes.

110. That there is a special agreement in each case?—The agreement is embodied in the general return of the village, and each cultivator receives annually an account book, in which the extent of his holding, his assessment, and the dates on which the assessment is to be paid, are entered in his own language.

111. And are those assessments for 30 years as well as those of the larger estates?—Large and small, they are all, with a few partial exceptions for 30 years, those that are settled under the survey.

112. And in the case of the small cultivators, payments are made through a native collector?—Through the village accountant.

113. Who is a native?—He is a native.

114. And other villages, as I understand you, pay in common, as in Egypt; do their work in common for the head man of the village?—There are very few who pay in common; it is not at all the usual system in Bombay.

115. In Egypt, as you are aware, the villages are mostly in common?—Yes.

116. I thought you said that in some cases it was so in Bombay?—Yes; the system is known especially in Guzerat; you generally find that it is due to the Rajpoot origin of the cultivators; they regard themselves as all brethren, and pay through one of their number.

117. With regard to the estates alienated for ecclesiastical purposes, and for others which you mentioned, would they be considered subject to the extra cesses which you mentioned for roads and schools?

roads?—Yes; I believe in most cases they have been included in the demand for the local cess, but not invariably.

118. Would it be considered contrary to the agreement if such a cess was made for the purpose of making or maintaining railways as well as common roads?—The question has never been discussed; and at present certainly I think it would be premature to start a question of that kind for the consideration of the people, because their fear always is that after the cess has been imposed it will be carried off and applied somewhere where it will not benefit them; and our object in reconciling them to the cess was to expend it as far as possible in the parts where it was levied, and to let them see that we kept faith with them in giving them some benefit for the cess that was levied.

119. At the same time is it not the case that the railway increases the price of their produce more than the common road?—Immensely.

120. And that the difficulty with regard to the revenue of India is greatly increased by the expenditure upon the railways?—Certainly.

121. And that therefore there would be the greatest possible reason for the cess being levied for the purpose of railways?—It is quite possible that they might be brought to see it in time, but it must be recollected that this cess, which might be termed a parochial or county cess, is of very late introduction in most districts, and it is above all things in matters of this kind, desirable to let the people thoroughly understand a new impost, and see its reason, and that takes some time over such great areas as you have to deal with in India.

122. You see no reason, on principle, against the introduction of such a practice?—In principle I see none; but I should think it a dangerous principle to act upon till the people get much more alive to the advantages of the railway than you can expect them to be just at present. At present they regard the railway as a great boon which has been conferred upon them; sometimes they may look upon it in a different light, as rather an infliction, if it takes off a piece of their fields, or anything of that sort; but, at any rate, they look upon it as a work of the Government, which is essentially distinct from anything that they are called to do for themselves or to pay for for themselves.

123. Where the railway runs through a field I suppose the rental is diminished in proportion?—The man is usually compensated or an abatement is made in his assessment.

124. Some of the assignments, you stated, were for service in the field, troops of horse for instance; are those troops included in the returns of the Army of India?—Yes; they would appear under a separate head as contingents of native states. They come down, sometimes, to one or two horsemen, to something less than the old knight's fee; but generally they were for considerable bodies, and they would always appear under the name of the rajah or nobleman who furnished them.

125. Even if he was not an independent chief?—The system would hardly be continued, except with a man of old family or great standing, or a man who had done some special service.

126. Are those troops always embodied, or are they only called out on emergencies?—They are generally required to be paraded, and to show themselves periodically. Some of them are very

efficient, some very much the reverse. Their character depends very much upon the spirit and character of the chief who furnishes them, and to a great extent upon the character of the European officer under whose superintendence he is acting.

127. Would that obligation to furnish men be changed in its extent at the end of 30 years; would there be a larger contingent placed upon the land in consequence of its greater value at the end of 30 years?—The 30 years' settlements would not apply to the contingents at all; they would be either personal or dynastic arrangements.

128. Then in those cases the owner would get the entire benefit of the increased value of his land?—Yes.

129. And the Government would not benefit in any way?—No.

130. Except in the case of extra cess?—They would get the indirect benefit of having the roads made through these estates.

131. You stated that in the Deccan, under the Peishwabs, a great part of the lands was subject to more than rack-rent?—Yes.

132. Then I suppose that the cultivators of the land were mere serfs?—They were mere serfs, and they could only pay what was demanded of them after a very considerable remission, which was granted almost annually, and depended upon the favour of the village and district officer, and of course led to endless peculation and oppression. The remission only in part reached the cultivators for whom it was intended; there was always a considerable amount of payment to those through whose hands the revenue was collected.

133. You are speaking entirely of what took place before we took the land over, I presume?—It could not be stopped when we did take it; I have seen terrible instances of oppression under our own Government.

134. But by degrees all that was altered?—By degrees, I hope, that has been almost extinguished.

135. You stated that when we tried what seemed to be very reasonable, namely, calculation of the gross produce with a deduction for expenses, and then a share of the remainder for the Government, there were disturbing elements which compelled a reversion to the old system; I do not think that you said what those disturbing elements were?—Very often there was the greater skill or experience of the cultivator; a good farmer made much more of his land, did much more justice to it, than a bad farmer; that was one disturbing element. In theory you dealt with the good and bad farming as having nothing to do with the matter; but when you came to work out the result, you found that you were demanding from your good farmer an amount of rent very much lighter than he had ever dreamt of paying, and that you were demanding from the clumsy farmer an amount of rent which it was not possible that he could pay. Those were elements that no European officer could take into consideration. Then again, the smallest mistake in the calculation, a mistake in the proportion of a bullock's hire, or the proportion which was to be entered in the sum, brought out results which were entirely vitiated; and it was found that in practice the rent derived from a very carefully considered theory of the subject, differed so widely from the rent which the people considered fair and reasonable,

Mr H. B. E.
Frere, K.C.B.,

1871.

able, that there was no making any sort of adjustment between them.

136. But in taking the classification of soil as the basis of rent reserved by the Government, there was no consideration as to whether a farmer might be good or bad, was there?—In the classification of the soil it was different, because you looked at the soil; you said, it is a soil of such a nature, and such a depth, and grows such and such crops; and you assembled a dozen experts, and you said, "What is a fair rent for this kind of soil?" and they said, "In this country if you are within so many miles of a market it should be so and so; if you are within so many miles of a market it should be so much more or less, and if you go into the next district where the people are better cultivators and the population denser, as you get towards that district you might take a little more; as you get towards the hills you must take a little less." They dealt with the question very much as a land surveyor and valuer would deal with it in this country.

137. Then you mean that you do not take into consideration whether the individual farmer in the same district is good or bad, but whether the whole population is in a higher or less high state of civilization in that respect?—Yes; you formed an average judgment with regard to farms in that particular part of the country, and you did not attempt a minute calculation which though it was theoretically correct, owing to elements which you could not always trace, led you astray in the result.

138. You stated that when the waste lands were brought under assessment, the population were encouraged to take them up?—Yes.

139. What did that population do before?—They cultivated very much less, and they were in a state very often bordering upon starvation; very deeply in debt, because then they never knew what they would have to pay if they took up a particular field. They knew that if the season promised well, they might have to pay very heavily for it, and that if the season failed them there was still a very heavy demand hanging over them, which they could only get relaxed by importunity; and, therefore, they hung back and cultivated just sufficient to keep body and soul together. The aspect of the country at that time was most miserable, and the people were in a state of great poverty and destitution.

140. But they were all cultivators?—They were all cultivators.

141. I should like to ask your opinion whether the 30 years is not a long time for which to fix the assessment of land?—It was found generally acceptable, I think; in some cases shorter terms have been fixed for special reasons; but generally, I think, the people like the term of 30 years; there was no particular reason for it that I am aware of.

142. I rather wished to ask whether you did not think that it was too favourable to the people and too unfavourable to the Government?—No, I think not; it seems to me that, as a fiscal question, you can hardly be too favourable to the cultivators as long as you do not go so low as to let them become careless as to what they do with the land; because, whatever they make out of the land, you get at in other ways of taxation.

143. In customs duties, you mean?—Yes, in customs duties and excise; and they consume one another's produce to a much greater extent.

144. At the same time, looking to the extremely rapid increase of very expensive communications, resulting, as you have stated, in doubling the price of produce in some instances, is it not too favourable to the cultivator if it is to continue for so many years?—It has not practically hitherto proved too favourable, and the danger in India always is that the Government officer will strain a little in favour of Government; and I think that, in a matter of settling the land assessment, you can hardly be too careful to impress upon your officers who make the settlement that they must not do more than would be considered a liberal settlement under their own Governments, and must not attempt to get more.

145. Is the revenue officer considered of greater value according to the amount that he brings in from the land?—Well, there is always a tendency to look upon a man who gives you a good balance sheet as an extremely good administrator.

146. I think it is not the case, is it, in the Presidency of Bombay that the 30 years lease begins and terminates everywhere at the same time; I mean that there are several different leases applying to different parts of the Presidency?—Yes, the settlements go on at the rate of perhaps two or three districts a year, so that it takes several years to get through one province; there are at present, I think, three bodies of surveyors and assessors that work in different parts of the country, and they settle independently of each other; there is no attempt to make them synchronous at all.

147. As a matter of fact almost every year leases are falling in and fresh ones beginning?—Yes.

148. All for 30 years?—Mostly for 30 years.

149. Sir Charles Wingfield.] You did not just now give us a distinct answer as to what proportion of the gross revenue is taken by the Government in the Bombay Presidency; there must, I apprehend, be some principle; you are aware that in Upper India the principle is to determine what is the rental received by the proprietor from the man who cultivates the land, and pays him rent, and then to take half that; is there no proportion at all fixed in Bombay?—No, there has been no attempt to fix any proportion; the settlement in Bombay is always as far as possible with the man who owns and cultivates the land; if he owns but does not cultivate, in most cases no mention is made of the cultivator; there is no difference made between him and his next neighbour, who owns and cultivates himself.

150. Neither is there in Upper India; we do not make any difference there; but by examination and classification of soils, and by looking at the rentals received by the proprietors, we determine what in our opinion the fair rental of the land is per acre; but you do not do that as I understand you?—No attempt is made to fix anything but what the people consider generally is a fair Government demand; I have seen attempts often made to adjust it, and to fix some proportion between that and the theoretical rental, but I cannot say that I ever saw them succeed.

151. With reference to the question that was put by the right honourable gentleman, the Member for Shoreham, about the propriety of the Government levying a cess for railways in the same way as it levies a cess for local roads, do not you think, on the other hand, that it is a right

right principle that a Government which derives a rental of 20,000,000*l.* from its landed estates, is bound to spend some part of that in the improvement of the land, that is to say, in works that will develop the produce of the land?—Doubtless, if it can spare it; but it must in India, as elsewhere, be a matter of discussion and adjustment. I think; between the cultivator and the Government, what each can do towards what is for the benefit of both.

152. But when I affirm that principle, I mean that it would be unreasonable to call upon the people to do every thing; that Government which derives such a great rental from the estate is bound, like the proprietor of an estate in this country, to spend some portion in works for the benefit of those living on it?—Clearly.

153. Another question was put to you, I think, by the right honourable Member for Shoreham, about assessing, differently, one class of farmer from another class of farmer. I fancy that in Bombay you are obliged to do what in Upper India we found it necessary to do, that is to say, to assess land held by those races which are less addicted to agriculture, lower than land in the occupation of those races which are famed for their agricultural skill and industry?—Yes, just as you would demand a lower rate in some very unimproved part of this country, than you would demand near London.

154. Also with reference to the races, there are some races which are not addicted to the arts of agriculture as, generally speaking, is the case with the Mahometans, and you cannot assess them so high as you would certain races in Upper India which are famed for their agricultural skill?—No; and you are obliged sometimes to give way to traditional prejudices which make Brahmins and Mahometans and other classes entitled to lower rates of assessment than would be fixed upon industrious cultivators.

155. In fixing 30 years for your settlements in Bombay, you were influenced probably in some degree by the fact of that period having been generally adopted throughout Upper India for the term of settlement?—I really do not know what led to the adoption of that precise term; it is very likely that it was in consequence of its having been adopted in Upper India.

156. And you know, of course, that in the early part of this century, in the numerous settlements that were made in Upper India, shorter terms were almost invariably fixed?—Yes.

157. But is it not the case that they are never found to succeed?—That was the impression; the first proposal for the assessment in Bombay, was that it should be for 10 years only; but it was argued that if it was meant that time should be granted to the people to recover themselves at all, 10 years was not sufficient.

158. On the whole are you not of opinion that a less term than 30 years will hardly give encouragement to the occupiers to improve the land?—I should be sorry to see the term reduced as a general rule.

159. I do not know whether it happens in Bombay, but I daresay you have heard of what happened in Upper India, when there were short settlements, namely, that as the term expired and resettlements approached, the people used to throw their lands out of cultivation in order to get a lower assessment?—Yes, I heard that was the case; I made inquiry as some of the settlements in the Deccan approached the end of the

term whether anything of the kind had been observed there, and I was told not. The contrary, I was assured, was the case in the Deccan.

160. I have not had personal acquaintance with the Presidency of Bombay, but I have read a great deal about land tenure all over India, and particularly I have studied the minutes of Mr. Mountstuart Elphinstone and Mr. Chaplin, and other gentlemen, which appear in the Report of the House of Commons in 1832; and I also read a book by Colonel Sykes, a Member of this House, called "Statistical Report of the Land Tenure in the Deccan." You are aware of that work I presume?—Yes.

161. And the conclusion which I have come to, not only in regard to Bombay, but generally throughout India, is, that the village system at one period before the Mahometan invasion existed throughout India, and that the traces of it were at the commencement of this century principally discernible in the Deccan. I mean by the village system the same system as the *merassee* of Madras, and the coparcenary communities of the Upper Provinces. Is that your view?—A village system existed and still exists in great force in the Deccan; but I doubt whether it was ever, as far as I could trace it, one which bound the people together as one estate, dealing through one man with the Government.

162. I have read also the very detailed accounts that appear in the Report of the Fifth Committee of the House of Commons of 1812, on the *merassee* tenure of Madras, and I have also read a little work that was published by the present Secretary of the Madras Board of Revenue, and it is shown from these reports that the *merassee* or village proprietary system in the Madras Presidency (which comes running up to Bombay) was identical with the village coparcenary system of Upper India; in fact you may take the descriptions given by the Madras collectors at the close of last century and the beginning of this, of the proprietary system that prevailed throughout Madras in a more or less perfect state, and you will find that where it prevailed perfectly the description is word for word applicable to the village communities of Upper India, to this day?—The *merasdar* tenures are known by that name throughout the Deccan, and in the greater part of the Bombay Presidency; they are even found as far as the northern parts of Scinde; but in the Deccan, in the districts bordering on the Madras provinces, *merasdar* signifies, as nearly as we could express it, a freeholder paying land tax to Government, a man who is absolute lord of his own tenure, but bound to pay a tax to the Government; they clearly in the Deccan acted together as the freeholders of an English village would act together, but there was no trace that I could discover of any joint liability.

163. But do you not think that the absence of the joint liability is to be ascribed to the fact of these communities having been so impaired by the long course of war and the exactions of the Mahometan Government, and especially by their system of farming out tracts to speculators?—It did not occur to me that that sufficiently accounted for the fact, because in parts of Gujerat you found the same system side by side, in the next village, with brotherhoods, where the men were distinctly bound together by the same ties as you find in the North Western Provinces; I think in the Gujerat collectorates you could find

Sir H. D. E.
Frere, K.C.B.
G.C.S.I.

Sir H. B. Es. the parallel of almost everyone of the tenures known in India, and the misgovernment that would have crushed out the system in one village could hardly have failed to have injured it in its neighbours.

Frere, K.C.B.,
G.C.S.I.
24 March
1871.

164. We find the same thing in Upper India; you will find in the same district village communities flourishing in full vigour, and in another part of it the joint property and the community quite obliterated, because some races were hardier and braver, and particularly the Rajpoots, who clung together, and co-operated with one another, and kept out oppressors and spoliators, and preserved their system: but the weaker races succumbed?—Yes.

165. The Committee of the House of Commons of 1812, in their Fifth Report, came to a very decided conclusion about these proprietary communities in the south of India, and they said that just in proportion as the districts of Madras had been a short or a long time under the Mahometan conquerors, so the early Hindoo constitution of society was found in more or less vigour, and that in the southern districts of Madras (I think in Tanjore, which had never been under Mahometan rule at all) it was found flourishing and unimpaired?—The same process has taken place in parts of Bombay, notably in Scinde, where all traces of a village system were almost crushed out; they were still discoverable, but very faintly.

166. In Guzerat it seems to me that the talookdars, who are mostly descendants from Hindoo reigning houses, you said, at the present moment, very much resemble in their position the talookdars of Oude?—Yes.

167. Mr. Elphinstone, I gather from these papers attached to the Report of the House of Commons of 1832, was a great admirer of the village system, and was anxious to continue it if he could?—So am I of the village system, but not of one embracing any joint liability on the part of the cultivators.

168. That is what in Upper India we consider rather the essence of the village system, the joint and several liability, holding the whole community responsible in the ultimate and last resort for the default of one of the body. Is not that so in the Deccan?—The essence of the system in the Deccan, I should consider to be the general municipal character of the institution, and not any liability greater than that which attaches to all municipalities.

169. I think, in the last century, shortly after we acquired the territories in the Bombay Presidency, some settlements were made on the village system?—Yes, but they were not successful; the people seemed to dislike extremely being made responsible for the revenue liabilities of their neighbours, where it was not their hereditary custom.

170. As you are aware they made village settlements about 1812 throughout the Madras Presidency, and that broke down; but the failure is ascribed to over assessment and to not defining the rights of the subordinate holders?—Yes.

171. But in Bombay it equally failed?—Yes.

172. And you attribute its failure in Bombay rather to the weakness of the joint principle?—I think it was contrary to the genius of the people.

173. Each field is separately surveyed, I understand. Now a field is one thing to-day and another thing to-morrow, there being no per-

manent boundaries, and what is one field this year may be cut up into six next year, and what is six now may be thrown into one. How does the surveyor regulate the size of a field?—He asks the cultivator, and the Mhar who is the hereditary conservator of boundaries, what are the ancient boundaries of a certain plot, and very often he says that they are inconveniently large or inconveniently small, and he divides them or unites them, according to rules laid down for his guidance; a trench is thrown up at the corners and at intervals along the line of boundary, and the earth is thrown into a mound which remains for a very long time; and these are all marked down upon the village map.

174. Then, in fact, he regulates the size of the field by motives of convenience very much?—Very much, as a surveyor would in surveying an estate in this country.

175. But he could not throw two fields held by two separate people together, without their consent?—No, that would always be a reason against throwing them together.

176. Is it what you may call a block survey, so much land as the surveyor thinks should go together and can be conveniently put together?—It is more detailed than a block survey. In districts where rice is cultivated it descends to the individual rice fields, which are very often smaller than this room.

177. And the assessment is made by the surveyor and not, as it is in Upper India, by the civil officer?—It is made by a separate establishment attached to the survey officer, not by the measurer.

178. Mr. J. B. Smith.] Is not a hole dug in each field to ascertain the quality of the soil?—Yes, generally; the surveyor does exactly as a surveyor would in this country. If he sees by a bank or a ravine and by the appearance of the country that the soil is all of one uniform quality, he is satisfied. If he thinks that there is a considerable variety, he digs and sees what the depth of soil is, and he goes sufficiently far down to satisfy himself; then a certain proportion of these fields are afterwards gone over at a different time by a different set of valuers, and the valuations are compared; and if there is any error found the work is done over again by a more careful officer. It is a matter of judgment not of rigid rule, and, as in any other appraisement, of course it is very difficult to say what are the exact steps by which the value is arrived at.

179. Sir Charles Wingfield.] Is the village map and the field register altered annually to correspond with the changes in cultivation?—The village map does not show cultivated and uncultivated; the field register does, and that is altered annually.

180. Then it frequently happens that one man engages with the Government for so many fields, but really there are many others who are co-sharers with him?—Yes.

181. Then are their names all recorded too?—If they show good cause at the time of settlement.

182. In that case where one man engages for himself with several other sharers, then the settlement becomes an approach to the co-partnership system?—Of course it does when there are partners in the farm.

183. And those people who are partners are probably members of the same family or descended from the same stock?—Yes, generally brothers.

184. But

184. But no interference is practiced in Bombay between the person who engages with the Government for the revenue of so many fields, supposing he does not cultivate it himself, and the cultivators whom he employs?—No; if it is in his name, and he pays the revenue, no questions are asked, and if there is a dispute it must be settled in a civil court.

185. No tenant right is allowed to grow up in the Bombay Presidency against the party who engages with the Government?—No.

186. In that respect you differ very much from Bengal and Upper India, where they allow a right to grow up after 12 years?—Yes.

187. But in Bombay it has never been alleged that there is any necessity for interfering between the cultivator and the parties whom he employs?—On the contrary, evil has been found to result from taking those questions out of the hands of the courts.

188. It is a civil action, in fact, and the revenue authorities have no summary power of interference?—No.

189. And that you think a sound system?—It is certainly found to work well, and I should consider it theoretically sound.

190. When this settlement was first made, or rather the settlement prevailing in Madras and Bombay, it had the effect, had it not, of putting cultivators and proprietors very much on the same footing; if there was more land than the proprietor chose to take, the cultivator could engage for it himself, with the State, and he became then quite the equal of the proprietor?—In the Deccan, almost invariably the cultivator and the proprietor were the same man. The proprietors in the Deccan, in nine cases out of ten, are of the cultivating class, and even when they are chiefs of the village, they take a pride in holding the plough, and in being cultivators.

191. But still, even where the community are a cultivating community, it does happen in almost every case, I presume, that some of the proprietors, for some reason or other (for instance, because they are women), do not cultivate themselves, but employ cultivators?—Yes.

192. And, therefore, where you come to adopt the Ryotwarree system, it does happen that if there is more land than the proprietors care to engage for, the cultivator is allowed to engage for it, and then he is put in equal position with the proprietor?—Yes; but in practice it is found that it is only in densely populated districts, where there is very little waste land, that there are cultivators who are not proprietors and who are not under special agreements with the proprietors.

193. I understand that that is the case now; but fifty years ago, when these settlements first began, half the land was desolated, and the difficulty was to get the people to engage?—Then there were no cultivators who were not proprietors, because there was so much waste land that any man could get his own land; everybody, with the rarest possible exceptions, had a field to which he belonged, as they would say, not a field which belonged to him but to which he belonged, and it was his duty, if ever it was made possible for him to cultivate it, to go back to that field and cultivate it.

194. But then it is well known that whenever the better times returned, and the proprietors came back to their land, these cultivators all gave way and allowed the landed proprietors to resume possession?—Yes.

0.59

195. In short, under the system in Bombay, one right only in the land is known, that is a full right of property, subject to the payment of the Government demand?—I should be sorry to say only one right is known.

196. I mean where this system prevails the party who engages with the Government is the only one who is recognised as having a right?—Yes.

197. *Chairman.* When the Government has been the holder of the field the rights of the occupants are recognised in the grant, and specified now always, are they not, in a schedule to the grant?—Yes.

198. Therefore, in point of fact, in receiving the revenue from the whole of the village, the Government equally recognises the rights of every occupant?—Yes.

199. *Sir Charles Wingfield.* I will put the question differently. Whenever a party engages to Government for the revenue of certain fields on his own account only, or on his own account and on behalf of others, he or they are the only recognised proprietors in the land?—Yes, those whose names are down in the village books.

200. And I want to draw from that this deduction, that this may perhaps be considered one of the recommendations of the system, that you have not a multiplicity of rights in the same land?—Yes.

201. You have no upper proprietary right, under proprietary right, cultivating right and occupancy, as we have in Upper India?—And still more in Bengal. In Bombay there is no such multiplicity of unrecorded rights.

202. In fact, you arrive at simplicity of tenure?—Yes.

203. *Mr. Birley.* With regard to these three systems of assessment, that is to say, with an individual cultivator, with a village, or with a district, do you settle with all upon the same principle, or do you allow an advantage to the village as compared with the individual, or *vice versa*; should you give any advantage in settling with a village in regard to the terms of assessment as compared with an individual?—No assessment is, as a rule, made with the village.

204. They are all taken as individual holdings, are they not?—Yes.

205. But the revenue is merely collected and paid by the head man of the village, or the proper authority of the village?—Yes.

206. Then as regards the district, which I understand is often the inheritance of some native chief, is that allowed any advantage in the assessment?—It depends entirely upon the original agreement; some of them were men almost on an equality with the sovereign who made the grant.

207. Those will come often into the cases of military tenure?—Yes.

208. Did I rightly understand you to say, that some of those cases of military tenure are so trifling that the persons are never called upon at all to fulfil their engagements?—No, they are called upon; but I know several cases where the obligation is only to furnish two or three horsemen.

209. Would they be required to furnish those horsemen?—Yes; they would be required periodically to do service.

210. You spoke of an expected increase at the next settlement, in proportion to the increased value of produce; I suppose there will also be a proportionate

*Sir H. B. E.
Archer, K.C.B.,
G.C.S.I.
24 March
1871.*

Sir H. B. Es. proportionate increase from the improved cultivation of the land?—There will be some increase, no doubt, just as Fifeshire now pays a better rent than it did 50 years or 100 years ago.

G.C.S.J.
24 March
1871.

211. Now, as regards the assessment for a term of 30 years, is it not your opinion that it was of great importance that that period should certainly not be reduced as giving confidence to the cultivator in the moderation and equity of the British Government, and not disturbing or unsettling their minds?—Clearly; I think that there is no magic in a particular number, but that, as a matter of judgment, a term of 30 years has been found to answer well, and that its success can be accounted for.

212. And it has been useful in a political sense as well as in a financial sense?—Decidedly; I may mention that Lord Napier of Magdala spoke of the cultivators of these Deccan districts as being the most contented agricultural population he had seen in India.

213. Mr. Bourke.] You have spoken of the rent-free tenure; is the land that is held under this rent-free tenure, held rent-free for ever; is it supposed to be perpetual?—That depends upon the peculiar agreement under which each holder holds; it varies, and a few are for ever.

214. Now with regard to the surveys to which you have alluded, is the tax to which these lands are subject, marked upon the survey?—There is the map and the survey papers, and a return of the size of the fields, of their quality, and so on, and the assessment is marked on the latter.

215. And are there evidence maps of ownership at all in any courts?—Yes, all the survey papers which are officially issued by the surveyor are received as official evidence in the courts.

216. Is there much difficulty in collecting the land tax?—Now there is none whatever: there used to be very great difficulty.

217. When there is any question about it, in what court is it decided whether a man is subject to the tax that is demanded from him or not?—The Collector decides: there is power of recovery afterwards of what has been erroneously paid.

218. Mr. Beckett Denison.] Is your answer with reference to the whole, or to the land-free tenure merely?—I was answering the latter question with regard to the whole of the tenures.

219. Mr. Beach.] Do the villages vary materially in size?—Very much indeed; I know one village of 22,000 inhabitants; and they vary from that to a single house.

220. Are the same number of collectors necessary in a small village and a large one, because you stated, I think, that 12 village officials were necessary to collect the revenue?—The 12 village officials are hereditary village officials, and they are considered commonly by the people as the proper complement of a properly equipped parish: of course they are not complete except in a large village; and in a very large village, such as I have mentioned, or even in one where there are more than a couple of thousand inhabitants, you would have more than 12; for instance, in some very large villages the notary has two or three assistants, and the village itself is divided into wards, and each ward is presided over by a sort of sub-head man, subordinate to the head man.

221. Then are they remunerated higher in these important villages than they are in the smaller

and unimportant ones?—Yes; there is a scale of remuneration for those who are considered essential to the Government work in the village, such as the head man, the notary, and one or two others; the others are left to be paid by the villagers very much at their discretion.

222. In exceptional years, such as a year of famine, the land revenue of course is reduced?—Yes.

223. How is that scale of remission settled?—By the discretion of the Collector in a surveyed district; the effect of light assessment in mitigating the evil of seasons of scarcity has been very marked, and the cultivators in such districts have tided over what would otherwise have been years of famine without asking for remissions; they do not voluntarily ask for remissions, because it is always an admission of the power of Government to interfere with them, which they would rather avoid if they can. But if it is a very severe season, and the Collector reports that remissions will be necessary, he is then authorised to go or send a subordinate to the spot, as a landlord would send a person in this country to see what abatement in rents was necessary.

224. When a 30 years' lease is given to certain persons, the proprietor or the cultivator, is it understood that at the end of this lease he has a claim for renewal, or is he a mere leaseholder for that period?—No, he has a claim for renewal, and the lease will be renewed with him, unless somebody else in a court of law establishes a better claim.

225. By way of claim to the previous occupation of the land, you mean?—It would depend upon the circumstances: the claimant might prove wrongful possession in any way, and be put in possession of his rights, but it could only be done by a decree of the civil courts.

226. Then it is considered a sort of hereditary right on payment of the necessary tax to Government?—Yes.

227. Mr. Fawcett.] The land revenue of India may be divided, I presume, into two portions, that which is fixed now, the amount of which can never increase or decrease, and that which is not so fixed; the permanent settlement is fixed in pecuniary amount for ever, is it not?—Yes.

228. What portion of the aggregate revenue at the present time, derived from the land in India, is derived from the permanent settlement?—I find in this return (which however only comes down to 1851-52) that three and a half millions is entered as the land revenue of Bengal, which, roughly speaking, may be taken as all permanently settled. There is also a portion of the revenue of the North Western Provinces; I am not sure what portion is there permanently settled, but I should think that the whole is about something more than four millions, probably.

229. Then approximately one-fifth of the land revenue of India is derived from that settlement?—About that I should say.

230. The only chief means of possible increase in the land revenue of India that you have alluded to arise from an increase in prices?—Yes; the chief means.

231. But as the improvement of prices increases the amount of the land revenue at the same time, the expenses of Government necessarily increase in a corresponding ratio, do they not?—Clearly.

232. Then the gain to the Government arising from any increase in revenue produced by that cause is not a real gain of revenue, but simply a nominal

nominal gain, is it not?—That depends on the Government; if it is a good Government I should say that they would manage to keep their expenses somewhat lower than the increase of their revenue, but all depends on the judgment with which the Government acts.

233. But there are considerations which show that the expense of the Government would increase in a greater ratio than any increase which you could get arising from the increase of prices from the improvement of the land, are there not?—No, I am not aware of them.

234. For instance, unless the Government were prepared to let all its employés deteriorate in condition, its civil servants, soldiers, and all the people dependent on it, it must raise their wages exactly in the ratio of the increase of prices, must it not?—Yes, that is one element.

235. But then, on the other hand, you stated in your evidence, did you not, that if prices doubled you cannot double the rent, you can only raise the rent, but in nothing like the same proportion?—Yes, you would always be obliged to keep it something under the increase of prices.

236. And therefore the increase in the revenue from the land does not proceed at the same rate as the increase in the expenses of the Government, so far as a considerable portion of the expenditure is concerned?—Even that must be taken with limitations, because you may expect that as the country prospers you may do with fewer soldiers; that has been notably the case in India. Though our own English military expenditure has increased, the aggregate expenditure upon men who are merely serving as soldiers in India has probably very materially decreased.

237. But do I rightly understand you, that the aggregate expenditure upon the army in India has decreased with the rise of the prices of commodities?—No; I am merely saying that as the country improves you may expect to keep your military expenses from increasing so rapidly as to overcome the difference between the proportion at which your revenue increases and the proportion at which your expenditure increases.

238. But am I not right in saying that the experience of the past up to the present time is entirely antagonistic to that theory?—We can only be said to have had a very few years' experience of any kind, and we are only at the beginning, it seems to me, of a system for the permanent Government of India.

239. But considering that there has been a great rise in prices during the last 10 or 15 years, as you admit, what is it which leads you to say that with that rise of prices expenditure has diminished; is it not exactly the contrary?—No, expenditure has not diminished; but new sources of revenue arise, and on the whole the Government ought not to be poorer or put to greater straits than it was when it was in a comparatively rough state.

240. No, it ought not; but the point that I want to come to is this, you look to an increase in the land revenue as mainly arising from the increase in prices?—Yes.

241. And that increase in prices must at the same time cause an increase in the charges in many of the items of Government?—Yes.

242. And, therefore, an increase in the land revenue, considering it as a question of revenue and expenditure, is more nominal than real, as representing advantage to the country?—No; it is a considerable increase upon a very large item

of revenue; upon an item of revenue which forms two-fifths of your whole revenue, and a greater rate of increase than there ought to be upon the comparatively small number of items of expenditure.

243. But the point which I want to bring out is this, the land revenue (I will put it in general terms) represents about two-fifths of the whole revenue of India that is favourably affected by any increase in the prices of commodities?—Yes.

244. The items of expenditure which are unfavourably affected by an increase in prices at least correspond to two-fifths of the expenditure of India do they not?—I should say not. Take for instance the large item of military expenditure, that at present stands at 16 millions. I believe that notwithstanding the increase in the pay that is necessary to be given, and all the other expenses of your soldiers, it is possible to reduce that expenditure; and I believe that though your military expenditure will increase in proportion more rapidly than your land revenue, still you might keep it within such dimensions as to be easily met by the increase of land revenue and those new sources of revenue which, as the country prospers, are created.

245. That comes to a question of policy; but you cannot tell for certain but what you may have to keep a larger army there. But I ask whether it is not the case that, leaving those questions of policy out of consideration, and putting it simply as a question of account, and assuming that the military expenditure is as large, and the civil expenditure is as large, the increase of prices which favourably affects the land revenue, will, at least, to a corresponding extent, unfavourably affect the expenditure?—Some branches of it. But I cannot admit that it is possible to separate the question from one of policy.

246. I want now to direct your attention to another point. With regard to an increase of prices, so far as one-fifth of the land revenue is concerned, the increase of prices there is entirely disadvantageous to the revenue, because you cannot increase that portion of the revenue, and although you cannot increase that, the increase in the cost of collection from having to increase the pay of the civil services, and the other services will be constantly going on, will it not?—You cannot increase the land revenue of a permanently settled district, but you may increase your receipts from other branches.

247. But I understood that we were confining ourselves to the land revenue now?—If you had no resource for the state but the land revenue, then I admit that you are in a bad way when prices are rising; but as the actual fact is, that every rise of prices creates new sources of revenue, I do not think that there is any cause for supposing that the rise of prices will make it more difficult to manage the country upon your legitimate resources than it is at present.

248. But confining our attention for the moment to the revenue derived from the permanent settlement which represents one-fifth of the whole revenue derived from land in India, that revenue is constantly being depreciated at the present moment in value, is it not?—I do not quite see that.

249. If you derive four millions from a permanent settlement at a fixed charge upon the land, and that four millions only represents,

Sr H. B. E.
Pres., K.C.B.,
C.C.S.I.

24 March
1871.

Sir H. B. A. owing to the prices having doubled during the last 15 years, half as much in value, half as much commodities or purchasing power as it did before; it is virtually depreciated one-half, is it not?—
Frere, x.c.n.
 • a.c.s.l.
 24 March 1871.

Yes, if everything rises in value in the same degree; but it seems to me that the supposition is an impossible one. With a rise in the prices of food, for instance, and agricultural produce, there must be a fall in other things, and besides that a permanently assessed revenue which is paid with difficulty at a time of low prices, is of course, a very much better thing than in a time of high prices, when it is easily paid.

250. But that does not at all represent my point. There is no doubt that there has been a great rise not in the prices simply of agricultural produce, but in the prices of all commodities. Owing to circumstances which need not be entered into now, there has been an enormous inflow of silver and specie into India during the last 15 years. It does not require demonstration that that must have depreciated the value of silver which has caused a rise in prices. Therefore the amount derived from the permanent land settlement represents a smaller purchasing power than it formerly did, does it not?—If you are limited to your land revenue that is so.

251. Do you think it necessarily follows that an increase of prices indicates greater prosperity in the people?—It is generally one indication, of greater prosperity. It may be an indication, of course, of extreme distress.

252. Are the facts conclusive which show that wages have risen in a greater ratio than the increase of the price of the commodities that the labourers consume in India?—As far as I could ascertain it was clearly the case that the labouring man who had nothing but his labour was in a vastly better condition since prices began to rise. He got so much more for his labour that he was able to live better and clothe himself better.

253. In some districts has not the general condition of the people suffered owing to the opening of European markets, and a great amount of capital and labour being devoted to the growth of European products which before was devoted to the production of food for the people?—No; I have always, as far as my observation goes, found that there was no ground whatever for that belief, except where the communications were very imperfect. Where the communications were very imperfect, there, of course, this sort of process occurred; there was a depletion of food at the time when the prices of other produce, oil seeds, or cotton or jute, or exportable produce, were high, and that produce was drawn from the country; and then if a period of high prices and short crops suddenly supervened, the bad communications prevented food coming in from a distance. But where the communications were good, there the laws that you find in operation in Europe told also.

254. But you say that this tendency to deteriorate the condition of the people has really taken place in districts where the communications are bad; are not the communications bad over a very considerable portion of India?—They are very much better than they used to be; but still very much worse than they might and ought to be.

255. I know that they are better, but over a considerable portion of India they are still very bad, are they not?—Yes.

256. Therefore this deteriorating influence on the condition of the Indian people has operated

very widely, has it not?—The change in prices does not penetrate very far into the places where the communications are bad.

257. You referred to levying a cess upon land for local purposes, such as education, and making roads; but supposing that you obtain so much from cess it ultimately represents so much deducted from your land revenue, does it not?—I think not, because it does not follow that a shilling which is taken for a special improvement such as making a road or for keeping up a school could be taken if you did not do something for it.

258. But you, in adjusting your land revenue, consider what the land has been accustomed to pay and what the tenants can afford to pay, do not you?—Yes.

259. Suppose that you take this case, you have to come down to re-adjust the land revenue on a particular field in Bombay, the land revenue previously paid has been 4 l., and there is a cess levied upon it of 1 l. That is, virtually, a land revenue of 5 l., because if it was not for that cess of 1 l. you could raise the revenue to 5 l., and leave the tenant in exactly the same position as he would be in if there were no cess, could not you?—No, I think not. The case is quite possible that you may be able to levy your 5 l. only on the condition that you make a road or keep open a school.

260. But you define land revenue, do you not, as rent, not as a tax?—It is a portion of the rent.

261. And you try to adjust the rent in proportion to what you think the tenant can fairly bear?—Yes.

262. And cess is rent too, is it not?—Yes, in that point of view of course it is.

263. Therefore, looking upon land revenue and cess as both being rent, it is simply the cutting one item into two?—No; in the one case you take actually the whole from the country, and give a man back nothing; in the other case you give him back the means of carrying his produce to market, or the means of improving his condition and producing more.

264. The land revenue during the last 10 years (I will take that period) has not increased at all in proportion to the general expenditure of the country, has it?—It increases much more slowly; there can be no increase in any given village during the currency of the 30 years' settlement.

265. Therefore, from that reason, considering that a considerable proportion of the land in India is permanently settled, and that a considerable portion of the land is on a 30 years' lease, you may say that until 30 years has elapsed, or a very considerable period has elapsed, it is an inelastic source of revenue, may you not?—No.

266. To a certain extent?—It is absolutely inelastic, if you take it alone in a permanently settled district; but in the districts which are settled on 30 years' leases, some of these leases are falling in every year.

267. But as a fact, during the last 10 years, I am correct in saying, am I not, that the increase in the expenditure has been four times as great as the increase in the land revenue?—I am not certain as to the proportion, but it has been much greater; I have no doubt that by referring I could give you the proportions.

268. Would you also furnish the Committee with

with the increase not only in the general expenditure of the country compared with the increase in the land revenue during the last 10 years, but with the increase in the cost of collecting the land revenue during the last 10 years?—Yes.

260. Mr. J. B. Smith.] Where the assessment is on a 30 years' tenure, supposing that a man has laid out a considerable sum in building, is he assessed for the improvement which he has made, or is he merely assessed for the increased value of the land?—He is merely assessed for the increased value of the land.

270. Now, as regards this settlement for 30 years, is it considered as a law or an understanding that it is a perpetual tenure, to be re-assessed at every 30 years?—Yes.

271. And that kind of tenure, as I understand you, has given the greatest satisfaction?—Yes.

272. And led to a greater amount of improvement than any other tenure?—The feature which gives satisfaction is the fixity for a term of years, and that extends to all tenures which are so settled.

273. Thirty years is a period which is much approved in India?—Yes.

274. And the cultivation of the land has very much increased where it has been let on that tenure?—Very much indeed.

275. I think you said that you approved of the principle of some tax being laid on the owners of land for the making of roads or railways?—Yes.

276. Now in case you levy a tax upon the occupier of land for a road or for a railway, at the end of 30 years that land has very much increased in value?—Yes.

277. Then you raise his assessment?—Yes.

278. Does not he pay twice; first he pays for the improvement, and then he pays in an increased rental?—I should make a distinction in the first instance between payment for roads and payment for railroads; with regard to roads the improvement is practical and immediate; with regard to railroads it is more distant, and a subject which I should think it unwise to press upon the country at present; but with regard to the effect to which you have alluded, I do not see that the man pays twice; he pays generally in the way of assisting the Government to make communications, and by those communications he increases the value of his property in perpetuity; a portion of that property, that is the land in which he is interested along with Government, acquires an increased value, and the Government interested in the land in partnership as it were with him, also shares, it seems to me, the right to benefit; bearing in mind also, that, as the natives of India are always ready to admit, the interests of the Government and the people are in the long run identical.

279. But now in the cases of Bengal where there is a permanent settlement and where the lands as in other places have been very much increased in value by railways; do you think that the owners of the land ought in justice to contribute to that improvement, or should they pocket the whole of the benefit for themselves?—I do not see why they should not contribute.

280. Would that be considered a breach of the conditions of the permanent settlement?—I should not consider it so; I have looked into that question very carefully, and it seems to me that any demand for a cess that applied to road-making in Bengal would clearly not be in contravention of the terms of the permanent settlement.

0.59.

281. It would seem to be just that they who have benefited by this outlay should contribute something towards it?—Clearly.

282. Do you think that it would meet with opposition in Bengal?—No tax is popular.

283. Mr. Lyttelton.] I do not quite understand the position of the village community as regards the collection of this tax for the Government; I understood you to say that the village is "the unit of settlement," but that the community is not jointly liable for the tax?—No.

284. The village authorities are made use of by the collector for the purpose of collecting the tax?—Yes.

285. How is it that the village corporation, as I may call it, is not liable in the same way as a corporation in England is liable for the county rate?—Because it is not in their bargain; they are a corporation for special purposes, and it is no part of their agreement that they should pay one another's debts.

286. Then what happens when a village does not provide its proper quota of land-tax?—The individual cultivators are responsible, and the Government has ample means for recovering from the crops.

287. Then the liability is, in fact, always individual as far as possible?—Yes.

288. It is only as a matter of convenience that the village authorities come in at all; they are not in any way liable as an English corporation is liable for county rates?—Not in the least; they are a corporation only in a restricted sense for special purposes, and the payment of one another's debts is not one of those purposes.

289. Then the State, in fact, stands, as far as this tax can be considered as rent at least, in the relation of a landlord to each individual proprietor?—Yes.

290. May I ask what mode of recovery the collector has against the individual who does not pay?—He has power to attach the crops.

291. And does that often happen?—It used to happen frequently; it happens very rarely now in a settled district.

292. You do not see yourself any political danger with regard to the power of duress in the intimate relations that exist between the State and the proprietors of the soil?—Not the least; there was none when the power was very freely and sometimes harshly exercised, and there can be none now that it is very rarely exercised, and only in exceptional cases.

293. I understood, from a question put by Sir C. Wingfield, that a village community is liable for its land-tax in Bengal, is that so?—Yes.

294. But you do not consider it advisable to introduce a system of a more extended responsibility in the Deccan?—No; I think, as a general rule, the most advisable course is to take what is the old custom of the country; if it is one of joint responsibility, then take that; if it is one of individual responsibility, then adhere to that; and do not attempt, because we think it good, to introduce one particular system into a country where it is not customary.

295. I understood, from the general tenor of your evidence, that the land-tax was equitably levied, and did not create a feeling of oppression?—Certainly; it is universally considered, I think, as the one right of Government that is never disputed.

296. Mr. Eastwick.] You mentioned a district, the

1871.

the revenue of which was 15,000 L. a-year; I should like to know the name of that district?—Inderpoor.

297. And you mentioned, also, certain districts in which the re-assessment has begun; what are those?—Inderpoor was one of the first.

298. Do you know at all whether the native Governments, in collecting the revenue, fixed any per-centage or any share; did they proceed on the basis of fixing a certain share that they were to have of the produce?—There were such shares laid down in their religious books, but they are never observed or practised.

299. Then what system could they proceed upon; they surely had a certain per-centage, had they not?—No, they generally took as much as they thought they could safely levy.

300. They referred to what had been taken before?—Yes, and they took all reasonable opportunities of enhancing it.

301. And have we adopted the system of taking what was taken before rather than taking a certain per-centage?—Our system (I am speaking now of Western India generally) was that laid down by Mr. Elphinstone, namely, to examine as far as possible what in the estimation of the people was the best time known to them, and, as far as possible, to take that as our model and not to exceed it, and in all possible cases to bind down the Government against exceeding its demands; and where there was a doubt to give it in favour of the cultivator.

302. And, I suppose, it could be shown what per-centage of the produce we really do take?—Yes; that could be shown in any individual case, but no individual case would give you much information with regard to the rest.

303. A general average could not be taken?—I should think it extremely difficult to get a general average, even of a district; you might, of course, take it in this way; you might make an estimate of the total produce of a district, so much wheat and so much other produce, and contrast that with the total land revenue; but even then there would be a great many sources of error.

304. Then it is impossible to say that 30 per cent. or 50 per cent. of the revenue is payable to Government in the Bombay Presidency?—I think you could tell what it did not exceed, but it would be very difficult to get at very accurate results.

305. In your opinion what would be the limit that it does not exceed for the Presidency?—As to the actual fact, I have no opinion on the subject; it is one of which I consider that the statistical elements of a very accurate judgment are wanting.

306. As to the payment of the village officials, is that taken as a per-centage on the rent that the Government receives?—Yes, it is so regulated; in a village which pays so much to Government the head man gets so much per cent.; there is a scale for the head men, a scale for the notary, and a scale for the malir who is the boundary marker, and from that is deducted whatever they may have had in rent-free land, and the balance is paid them in cash.

307. Do the Government accounts show that?—Yes.

308. And does it vary all over the country, or is it the same per-centage in every village?—It varies slightly in different places.

309. But I suppose it could be stated at some-

thing near the exact fact what the per-centage is for these village officers?—I could give you examples of many cases.

310. Would you have the goodness to furnish them?—Yes.

311. I suppose it would be a fair way of ascertaining the net return of the land to deduct the per-centage paid to the village officers, and also the expenses of the different employes, and further, also, a part of the European collector's pay, because all that is to be deducted from the land?—The collector in Western India is collector and magistrate also, and a certain portion of his pay, for the sake of account, is debited to the Revenue Department and a certain portion to the Judicial.

312. Mr. Denison.] About one-half to each department?—I think about one-half.

313. Mr. Eastwick.] But all that would be shown exactly?—Yes.

314. Do you see any way at all of reducing the expenses of collection? I suppose, for example, that the re-assessment would be much cheaper than the first assessment?—It will be somewhat cheaper; but I should think not to any great extent. There must be a saving in several respects; but I do not think that the re-assessment has gone on sufficiently long to enable you to say exactly how much.

315. Do you think that the number of officers to whom payment is made could be reduced; do you think, in fact, that our staff is too numerous?—A great portion of the work, no doubt, will not require to be done over again.

316. I think you did not say anything about the different tax which is imposed upon different kinds of land, or rather upon the different sorts of produce that is cultivated. There is a different tax upon certain land, is there not?—Where the land is irrigated, then there is an extra cess.

317. Do not they class specifically garden land, which pays so much more?—Yes.

318. And I presume sugar-cane would pay so much more?—No; there is no change in the assessment according to the crop.

319. Whether opium, for instance, or tobacco was cultivated, they would all pay the same?—Opium is not cultivated within the Bombay Presidency; tobacco would pay the same as any other crop growing in the same field.

320. I suppose that the great change in the state of the roads has been since the great advance in the cotton cultivation; that was the time when they were recovered out of their distress?—I think it began before that; I think they were at the worst perhaps about the year 1840, and from that time there has been a gradual improvement.

321. To what do you attribute the improvement?—To a variety of causes; to better communication, to a great importation of silver, and to the land assessment being settled; but, as I mentioned before, I look upon railways and such roads as have been made, as among the greatest causes of the improvement in the condition of the people, notably by enabling them to carry their labour to different markets at times when they do not require it in their own fields.

322. I have seen it stated that the increased cotton cultivation was the principal cause of the wealth of the ryot; is that so?—The rise in the price of cotton gave an immense impulse to wages, and to industry of every kind.

323. And was it found that cultivation of waste lands extended very much after the rise in the price

price of cotton?—The land that was waste at the time when the American war broke out was only to a small extent capable of producing cotton; the great breadth of land which was employed to produce cotton had previously produced other crops.

324. Do you think that it is known at all how the cultivators invested their savings from this cotton period; was it that they cultivated fresh land, or that they deposited the money anywhere, or that they laid it out in the ornaments of their women, or in what way?—In almost every way; they paid off a vast amount of debt. I saw communities which appeared hopelessly in debt before, where they assured me that they were clear of debt after three or four years of the high prices. They bought land and agricultural stock; they hoarded some money, but not, I think, very much; they very generally bought metal utensils where they used to use earthen ones; they bought better clothes, and they put a very considerable sum of money into what is their savings bank, *i.e.* the ornaments of themselves, their wives, and their children, which are generally of pure metal, gold or silver, and which are sold in times of distress, just as a hoard would be drawn from any other source.

325. And do you think that the system of advances is nearly extinguished now?—The system of advances is, but the bankers are thriving like other portions of the community, and I hope will continue to thrive.

326. I want to get at whether the system which was so exceedingly injurious to the cultivators, that of making advances at very high interest, may now be considered to have passed away?—It is very much limited, it will probably never pass away, but it is very much less common than it was then, and more men deal than formerly dealt with their own money, and have money to spare instead of being obliged to borrow.

327. In the Bombay Presidency has that matter been considered at all, about which there has been

some considerable discussion, as to the not using of manure by the native cultivators, the manure being all used for fuel?—Yes. The best classes of cultivators generally in Western India are well acquainted with the value of manure, and they use it when they can get it, but owing to a long course of poverty in a great many cases, they have got out of the habit of using it, and I have no doubt that there is as much room there as in England for every kind of agricultural improvement connected with high farming: I believe that they would take to it, and perhaps more readily than our English farmers do. There is a great waste of manure in fuel owing to the want of firewood in the country; the forests have been recklessly cut down, and there has been generally a great want of firewood; measures have been taken for several years past to supply that want by planting fuel reserves, and they have been of late years very much systematised and extended, but they are still far short of what is necessary and desirable.

328. We may fairly look forward, you think, to a very great increase of produce, when a proper system of manuring is adopted?—Very great: I believe that there is quite as much room there as in any European country for agricultural improvements of that kind.

329. Did you quite complete the statement of the agricultural divisions of the country; do not we derive some revenue from the land in Kattywar?—Yes, that is in the form of tribute.

330. What per-centage do we get from that?—I think we get about 22 lacks of rupees, 220,000 £, altogether, from that province.

331. Is that susceptible of increase, or is it a stereotyped sum?—That is nearly all fixed.

332. Do we derive anything from Mandavee?—We do derive something, but I am not sure what.

333. You have now stated everything that we get from land?—Yes.

Sir H. B. E.
Frere, K.C.B.,

THE RIGHT HONOURABLE ACTON SMEE AYRTON, IN THE CHAIR.

Sir HENRY BARTLE EDWARD FRERE, K.C.B., G.C.S.I., recalled; and further Examined.

Sir H. B. E.
Frere, K.C.B.,
G.C.S.I.
—
28 March
1871

334. Mr. Beckett Denison.] You stated to the Committee that the gross receipts of the land revenue of the Bombay Presidency are in round numbers three and a half millions. Can you say off hand what is the proportion that Scinde bears to that?—I am not sure whether the returns here give it, but I could easily get that.

335. And Canara?—And Canara also.

336. Canara has been twice transferred, once originally from Madras to Bombay, and then back again to Madras, has it not?—I think that it has only been transferred once, about eight years ago, from Madras to Bombay.

337. With reference to the cotton trade?—Partly that, but more with reference to general geographical distribution, I think.

338. Is not the communication with Canara almost entirely by sea?—From Bombay it is principally by sea?—The communication with the interior is very imperfect. Of late years roads have been made, but I do not think that one of them is thoroughly finished yet.

339. Do you happen to know whether, for the purposes of Government, that is to say, for the expenses of Government, we have to import coin into Canara?—I should think not.

340. Are there no troops there?—There are no troops there.

341. It might be the other way, that Canara sends some of its surplus to the land revenue?—I have very little doubt that that is the case.

342. Either to Bengal or to Bombay?—Yes; I may mention that Canara is opposite one of the gaps in the great barrier of the Western Ghâts, which gives an opening into the interior. The causes of the bad communication are less those of the difficulty of the mountain range than the thickness of the forest.

343. I suppose that we shall come to that subject at a later period of our investigation. You have mentioned also Bombay and Salsette; what are the land revenues in Bombay and Salsette, exclusive of Bombay Proper?—I could not put my finger upon that immediately, but I will furnish it.

344. What I want to arrive at is this; is the position of the Government, as the superior or supreme landlord, exactly the same in Salsette and Bombay Proper as it is in other parts of

the Presidency?—No, the position is very much modified by old Portuguese tenures, and by modern English tenures, which have been introduced to a great extent within the limits of the late Supreme Court, the present High Court of Bombay.

345. Has any portion of the revenues of Bombay Proper been made over to the municipality of Bombay? I mean of what was the original land revenue?—I think not, but I could give you the exact sources of the municipal revenue if you would allow me to refer to the returns. Portions of land have no doubt been made over, but I do not think any considerable portion of our land revenues has.

346. You told the Committee, that in the assessment of the land revenue of Bombay, there was no well-defined principle on which it proceeded; but that the revenue was fixed, in your own words, I think, upon the local opinion of what each plotter was able to pay?—I think I was misunderstood if I was supposed to say that there was no principle. I said that there was no definite fixed proportion, either of gross produce or net produce, or of rent; but a varying proportion was taken of what would form the rent, if it were calculated according to strict economical principles, a proportion varying from the very lightest to the very heaviest payment.

347. But for the purposes of statistical comparison, are there no data upon which we could rely, enabling us to compare the incidence of the land revenue in Bombay with any other part of India, or with any other country in the world?—Yes, I think there are. I should doubt the possibility of striking such an exact proportion as your question seems to indicate in almost any country; certainly, only in countries where the statistics of agriculture are kept with unusual care.

348. Approximately, I think it has been done in other parts of India?—I have tested a good many of those comparisons, and I have generally found them open to very grave sources of error, and very often very misleading. But the point of comparison, which I think practically is the safest, is the condition of the people before and during a settlement; and that seems to me almost the only test you can apply, even in such a highly civilised

civilised country as England, where you have comparatively very accurate statistics, and where you can rely upon the voluntary statements that are made to you much more than you can in India.

349. Previous to this 30 years' settlement, the settlement of Bombay was an annual one, was it not?—Yes.

350. For the whole year or for each harvest?—For the whole year.

351. Then the agreement with the owner of the field or with the cultivator, was made in the spring of the year, I suppose?—It was generally made about June or July.

352. Previous to the rainfall?—Previous to the rainfall; that is to say, the sum which, supposing the season turned out favourably, would be the man's assessment, was entered against his name in the village books.

353. And under that old system was the amount of revenue at which he was assessed calculated upon the probable out-turn of the year of his field, or upon the out-turn of the past year?—I am speaking very roughly; but generally it was calculated at the very utmost, that he would be able to pay in an extremely good season.

354. How many instalments of Government revenue are there in the year?—They varied formerly, and they vary still according to the crops. There has been considerable relaxation of the old strict rules since the people got easier in their circumstances, and paid with greater facility. Generally, I think, at the time that these settlements were first introduced, they began about November, and after that, they were almost monthly up to April or May; and there was generally one or sometimes two after that.

355. Arranged, I suppose, with reference to the facility of getting produce to market?—Nominally; but the arrangement was very imperfect, and it was generally rather hardly calculated, so as to catch the cultivator without leaving him much chance of making away with his crop.

356. You told the Committee that under the old system processes of duress were very common?—The attachment of the crops was extremely common.

357. Attachment of the standing crops?—Yes; and sometimes personal oppression was found to prevail to an extent which showed that the pressure upon the cultivator was really cruel.

358. Have you any sort of idea of how many hundred thousand proprietors in Bombay are in direct agreement with the Government for their land revenue?—I could refer to returns, and give the Committee a tolerably accurate idea of the number.

359. Balances of land revenue are comparatively rare under the present system, are they not?—At present they are very rare; they used to be very heavy.

360. And the absence of processes of duress, and the absence of balances of land revenue, would argue a comparatively comfortable state of things on the part of the agricultural community, would it not?—Certainly.

361. Do you happen to know whether the transfer of lands to bankers and others is less common than before?—To bankers it is less common, but the land has a marketable value now, and is sold, to a great extent, by one cultivator to another. On the most careful inquiry 35 years ago, I could, in some of the districts I refer to, find no trace of transfer by sale.

0.59.

362. Speaking generally, have the people who have direct engagements with the Government for their land revenue, the right of sale and mortgage?—Generally,

363. There are, of course, exceptions to that rule in copartnery communities?—They are very rare. There are a few exceptions, but wherever a man has a definite right entered in the village books, with very rare exceptions he can sell that right.

364. Is it usual, or is it the practice, to take a distinct written agreement from the proprietor or owner of a field for the amount of the revenue that he has to pay?—No; the practice of taking separate agreements annually has fallen into complete disuse.

365. I am not speaking of annual agreements; but at the time the settlement is made, does the settlement officer take an agreement from the individual to pay so much annual revenue?—No, because the agreement is only from year to year still. He can in any year throw up as much of his land as he pleases, and when he pleases, provided he gives notice at the commencement of the season.

366. In the event of balances of revenue, is it the head man of the village that puts in force a process of duress, or does it come from a higher officer, a subordinate revenue officer?—The head man has power to make the demand, which, in itself, is a very considerable social pressure upon the person from whom the money is demanded. I may exemplify that by giving the instance of a village in which the Government land rent was nearly 2,000 £. or 20,000 rupees, but it was all collected by one person. I made some inquiry about it, and I found that the whole amount of duress he employed was to send a small staff, something like a constable's staff, to the defaulter, and to tell him that that must remain with him till he paid, and the mere shame of having this property of the Government left with him had a social effect sufficient to compel him to pay, and it was never found ineffectual. The cultivators will make great sacrifices to pay. But the power to imprison is reserved to the higher officials, and not given to the villagers.

367. You said in answer to Mr. Eastwick that where the land is irrigated there is an extra cess; is that shown as an extra cess on account of the irrigation or is it all mixed up as one account?—Generally it is shown separate; of late years it has, in all fresh arrangements, always been shown separate.

368. In the books of the village accountants or in the books of the revenue officer?—In the books of the village accountant; and once in the village books, it would be traceable always afterwards.

369. With regard to the remuneration to the village officers of which we have heard a good deal, is it a per-centage upon the amount of Government revenue, or is it an old hereditary fixed amount?—The village officers are generally divided into two classes, those who do some service to the State beyond the village, and those who only serve the village. With regard to those who do service to the State beyond the village, that is to say the head man, the notary, and the man who shows the boundaries, and occasionally one or two others, their remuneration is fixed generally at the settlement, according to the old rates, modified where they were inadequate by a fixed percentage allowance; they were generally remunerated,

Sir H. B. E.
Frere, K.C.B.,
G.C.S.I.

28 March
1871.

Sir H. B. E.
Frere, K.C.B.,
G.C.S.I.

28 March.
1871.

413. I think you said the other day that you had seen a gradual improvement in the condition of the people since about 1840?—Yes.

414. Does the steady increase of the influx of silver into Western India date from that time?—I think the great influx of silver is of later date than that; probably it was not very marked before about 1850.

415. Of course that is all connected with the balance of trade?—Yes.

416. Mr. Grant Duff.] Am I right in concluding from your evidence that the rise of land revenue which will result from the re-settlement now proceeding in the part of India of which you have been speaking, will be considerable?—I think so.

417. And it will be gradual, will it not, some increase accruing every year?—Yes.

418. But you cannot, I fear, make any guess as to the amount of the future annual increase?—No, because it would depend considerably upon prices and communication.

419. Part of that annual increase comes, I understand, from augmented imposts on property already taxed, part from imposts on new land that has come into cultivation since the last settlement, and part from fresh imposts on cultivated land which had been overlooked by, or concealed from, the settling officer in the former survey?—Yes. I should think that at present, in most settled districts, there was very little room under the latter head for additional income.

420. The tendency in Bombay, as elsewhere in India, has been of late rather to diminish than to increase assessments in proportion to the means of the cultivator, has it not?—Certainly.

421. I will read some sentences from a Despatch of the Court of Directors in 1856, and ask you if they accurately define the received official view in India as to what the land revenue should be: "The officers engaged in the duty of fixing the assessment should always bear in mind that as you have expressed it, the right of the Government is not a rent which consists of all the surplus produce after paying the costs of cultivation and the profits of the agricultural stock, but a land revenue only, which ought, if possible, to be so lightly assessed as to leave a surplus or rent to the occupier, whether he, in fact, let the land to others or retain it in his own hands;" is that the received official view in the Bombay Presidency, as elsewhere?—Yes, it is.

422. And are you satisfied that the Bombay re-settlement is being made on just principles, with fair consideration for the Exchequer, and with fair consideration for the cultivator?—I think so.

423. And the land revenue is as little disagreeable to those who pay it as any tax can be, is it not?—Much less disagreeable than any other tax; and it is looked upon as so entirely a customary right of the Government, that as long as it is possible to pay it the duty of paying it is never questioned.

424. Am I right in gathering from your answers to the Honourable Member for the North Riding, that the expense of collecting cannot, in your opinion, be very much diminished in the districts about which you have been speaking?—I think not much.

425. Can it, do you think, at all?—Not the expense of actual collection, I think. I may mention that all officers who are employed in collecting the revenue have many other duties,

some of them judicial, and some of them the miscellaneous sort of duties, which fall in this country upon those who are connected with the poor rates and the parish officers; and duties of that kind are so much on the increase of late years that, as a rule, the village officers are much harder worked now than they used to be, and what was a valuable semi-sinecure in former years has now become a very hardly-worked and hardly-paid office; and I do not think that there is much economy to be looked for, as far as regards the collection of the revenue.

426. Do the holders of rent-free estates in the districts of which you have been speaking, pay road cess?—Some of them do; I think not universally; but it depends a great deal upon the terms of their tenure.

427. Chairman.] Is any free tenure held to exempt a man from paying road cess in Bombay?—I think it is, in some cases.

428. Mr. J. B. Smith.] I understood you to say that under the 30 years' settlement, any person who had lands assessed could throw off any portion of them on giving one year's notice?—In any year.

429. What becomes of that land; does it revert to the Government?—It is at the disposal of the Government, who may let it to anyone who chooses to take it up.

430. And can this man at any future time reclaim the land?—If he has a proprietary right in it, but he must establish his claim when once it has passed out of his possession, in a court of law.

431. Is it a common thing for a man to give up land in that way?—Very rare.

432. When the 30 years' settlement was commenced, did the same rate of assessment go on for the whole 30 years, or was it altered and raised year after year as the land became more valuable?—Not during the currency of the 30 years. An assessment was fixed upon it; a portion of the rent which was to be the assessment for the 30 years.

433. Then in that case it is impossible that Government can receive any benefit from a re-assessment till that 30 years has expired?—Yes.

434. And then the next assessment will go on upon the same principle?—There will be a re-valuation on the same principle.

435. Do you think that that is a fair principle; for instance, say that 10 years after the assessment has begun, there are roads made through the district which double the value of the land; do you think that the Government ought not to avail themselves of that advantage, having laid out the money?—Perhaps, theoretically, such a claim might seem reasonable, but as matter of practice, it is so seldom that anything marked is done within the 30 years, that it is much better to wait till the lease is out.

436. For instance, the opening out of a river, or the carrying of a railway to the district, would be a marked improvement, would it not, and tend to increase the value of the land?—It would, but its effect would hardly be visible till so near the end of the lease, that even supposing it were commenced immediately after the lease commenced, it would be better, I think, as matter of practice, always to wait till the lease has run out.

437. Then, in fact, you would not recommend any alteration?—Not any alteration in that part of the system.

438. Mr.

438. *Mr. Fawcett.*] You promised me last time to supply in your evidence this day a statement comparing the increase of the expenditure during the last 20 years with any increase that may have taken place in the land revenue?—That is not complete.

439. It seems to me to illustrate the way in which the accounts are kept. Should you mind telling me how it is that such an evident piece of information as that cannot be supplied at once; is it not contained in the annual accounts; cannot you simply refer to them, and find it out at once?—No doubt it is there; but it takes some time to extract information bearing on a point of that kind.

440. But do not you think that the accounts of a country ought to be kept in such a way, that it would take, not only not a day, but not an hour to find out the amount of the most important sources of revenue, and the aggregate amount of expenditure?—They would be very perfect accounts; I am afraid more perfect than we have now.

441. But certainly in the accounts of our own country, it would not take an hour to find out what, during the last 20 years, had been the annual expenditure of this country, and what had been obtained by customs and excise, and so on; and why should it not be the same in regard to India?—Perhaps if I had understood the honourable Member's wishes better, and had applied myself exclusively to that, I could have furnished the information to-day. I have no doubt that it would be very readily accessible; but I understood the question to relate entirely to the land revenue, and there would require to be made a good many deductions from the total aggregate of expenditure, in respect to the charges on the revenue, to show the charges on the land revenue; but as I understand the honourable Member's wishes now, I have no doubt it can be given.

442. Will you tell me what has been the annual increase in the land revenue of the country during the last 15 years?—A statement put into my hands by an honourable Member of this Committee shows the land revenue in 1856, as 17,902,000 *l.*

443. What was it five years after that?—In 1870, it was given at 21,150,000 *l.*, an increase of 18 per cent.

444. What is the aggregate expenditure of the country for those periods?—In 1856 it was 33,852,000 *l.*, and in 1870 it was 49,787,000 *l.*

445. What rate of increase does that represent?—Forty-seven per cent.

446. There has been an increase of 18 per cent. in the land revenue, and an increase of 47 per cent. in the aggregate expenditure?—Yes; but perhaps the Committee would allow me to mention, that I understood the honourable Member's question to relate merely to the increase of expenditure on land revenue.

447. *Chairman.*] You wish, I think, to give some explanations of some answers in your former examination?—One point related to the question put by the honourable Member for Brighton, with regard to the permanent settlement. The conclusion which he drew seemed to me to be correct, as I mentioned, in theory, yet the theory was not practically exemplified, even in Bengal; because there are considerable amounts of land revenue in Bengal itself which have not been hitherto disposed of in permanent settlement.

0.59.

But take as an example a large province, of which the proprietor has the whole of the land revenue as his only source of income, which was the supposition, I think, put by the honourable Member for Brighton. Even in that case, it seems to me that it would be for his advantage to sell, or to tie himself down from an annual or periodical addition to his income from the land, with regard, at least, to a considerable portion of that land. If you take any province of the United Kingdom, and suppose that the proprietor has the whole of the rent, and nothing but the rent, as his income, it is evidently for his interest, as a matter of practice, to dispose of a portion of that land to people who will make the most of it as absolute proprietors, not liable to any future increase. I do not, however, at all disagree with the conclusion which I think the honourable Member would draw, that periodical settlements were, upon the whole, those which best served the rights of the State with regard to its income.

448. Have you any other point on which you wish to add to your evidence?—There was a Commission which sat to ascertain the exact increase of prices in Bombay in 1866, I think, and if the Committee wished for information on that point, I would give, in a general abstract, the results of that Commission, the evidence of which was rather detailed with regard to prices generally. (*Vote Appendix.*)

449. Those proceedings were printed, I think, as a State Paper, in India?—Yes, they were printed as a State Paper in India. Then I wish to mention that the Bombay system of survey had been extended to Mysore and Berar, with results very much similar to those which had followed in other parts of the Bombay Presidency.

450. *Mr. J. P. Smith.*] The 30 years' settlement, you mean?—Yes; the 30 years' settlement is the rule, with occasionally shorter settlements in other cases.

451. *Mr. Fawcett.*] Will you kindly state what the conclusion of the Commission was?—The conclusion they came to was, that the increase of prices differed very much in different parts and different classes, but that it was very considerable over the whole of Western India.

452. Did they give an instance of what it was?—Not any estimate, but a very large body of facts, of which the principal features might be put into a short Paper, which, if the Committee would allow me, I would hand in.

453. *Mr. B. Denison.*] Supplementing the figures given by the honourable Member for Brighton, the land revenue is 18 millions for 1866, and is estimated at 21 millions in the present year; but the total revenues in 1856, including all the various heads of revenue, were 33 millions, and the estimate for this year is 50 millions?—Yes.

454. *Mr. Grant Duff.*] Therefore the increase on what I may call the general property of the Government of India during the last 15 years, has been very much greater than the increase in what may be called their landed property?—Yes. There was one more point connected with the surveys which I should like to mention, and that is, that there seems to me a great necessity for having some means of ascertaining directly from the cultivators their views regarding the assessments, which used to be ascertained by general communication with them, and for which

D—

there

Sir H. B. E.
Frere, K.C.B.,
G.C.S.I.

28 March
1871.

Sir H. B. E. there has every year become less and less facility
Frug, K.C.B., as our officers become more completely occupied,
G.C.S.I. and less able to put themselves in intimate communication with the taxpayers. I think that it would be very desirable that, before every revision of assessment after the expiration of the 30 years' leases, there should be some means of directly ascertaining what the cultivator and the cultivating class have to say upon the subject.

28 March
 1871.

455. *Chairman.*] You mean that a superior officer should always make a tour in the district, and make his own inquiries?—I think that the heads of villages and men of that class should be always required to state categorically their views upon what is impending over the class which they represent.

456. *Mr. Dickinson.*] You gave the land revenue as 17,902,000*l.* in 1856, and 21,000,000*l.* in 1870-71; last year includes upwards of a million for water rates, and that is not land revenue?—Those figures were supplied me by an honourable Member.

457. *Chairman.*] Is there any other point that you wish to refer to?—There is a note by the present Lieutenant Governor of Bengal, Mr. George Campbell, which is appended to his report upon Orissa, which seems to me to indicate more clearly than almost any paper which I know of, the relative merits of permanent settlements and periodical revisions of them. I am not sure if it is before the Committee.

458. In speaking of the elements upon which the settlement was based, you did not mention whether the question of what may be called the wet land or the natural power of obtaining water was taken into account; I should like to ask you whether, apart from any question of irrigation on a large scale, or Government irrigation, in fixing the settlement the natural supply of water to the land so as to constitute it wet land is taken into account as an element for taxation?—To some extent it is. Almost all the irrigation is from wells which involve considerable expense, and it has been a great question and has been decided variously in various provinces at different times, as to whether it was not better for Government to waive all claim for irrigation from wells where they involved considerable cost to the cultivator in the construction. But as a general rule there is a separate tax upon the land which is irrigated from water so raised, which is traceable in the accounts.

459. That would depend upon the quantity of the water and the nearness of the water to the surface?—Yes.

460. Is there also an element of taxation in what may be called the natural flow of water from rivers, apart from any expense of irrigation, constituting what is called wet land?—Yes.

461. And is that wet land extremely valuable sometimes from its natural circumstances?—The "wet land" in a revenue sense is generally rice land, which is assessed very much higher than any other kind of land.

462. What is the maximum revenue paid on the land most favourably circumstanced for production and moisture; what have you known to be the highest rate of assessment?—In Government villages, I think at present, about 10 rupees would probably be the highest; 1*l.* on an acre; but it is very much higher in some of the Native States. On the other hand, they make a considerable deduction if inferior crops are

grown on it; they look more to the crops than we do.

463. They may be said, then, to descend from 1*l.* down to a very insignificant sum?—Down to probably 4*d.* or 6*d.* an acre.

464. You also stated that on the settlement there was a great demand for unoccupied land; can you state what is the probable extent of land now unoccupied which is capable of being tilled?—It could be ascertained from the records, but I could not state it immediately.

465. But it varies very much in different parts of the Presidency, does it not?—In most parts of the Presidency there is really very little unoccupied land that is fit for immediate occupation. In others, for instance in South Canara, in Scinde, and in Kandeish, and in the northern parts of Guzerat there are very large tracts of land which is still in a state of forest or unoccupied land.

466. Capable of tillage?—Capable of tillage.

467. I presume that there are great breadths of grass lands and wood lands that are incapable of tillage but will always be permanent pasture?—Yes, and if they are not common lands, common to the whole village, they pay as much or more than they would if tilled.

468. *Mr. McClure.*] Are those uncultivated lands the property of the Government?—Not generally; the neighbouring cultivators generally have a claim upon them, and very generally in Bombay there is some reason in their remoteness or difficulty of cultivation, sometimes from unhealthiness, which has retarded their being taken up.

469. *Chairman.*] You will observe that in the account of the Bombay land revenue, after deducting charges of collection of the land revenue which amount to 421,888*l.* for the last published account, there is a still further reduction of 701,858*l.* for allowances and assignments under treaties and engagements?—Yes.

470. Can you state generally what is the character of those allowances and engagements, whether they are all of a permanent character or whether they are for the lives of the present possessors?—They would vary very much; some of them would be permanent some would be for one or two lives. A considerable amount of the rent-free land was brought under assessment during the last 20 years prospectively, and in other cases it was assessed at once, an assignment being made to the holder for one or two generations.

471. These represent the grants and claims of that character before the acquisition of the territory by the British Government, and the grants and claims that were recognised by the British Government, or made at the time of the acquisition of the territory?—Yes.

472. Do you think that the diminution of that deduction will be material and considerable in the course of years?—It will be considerable, I think.

473. Then there is another item: "Allowances to district and village officers, &c.," 266,827*l.*; does that item represent the charge which you stated was of a character so hereditary that it could hardly be diminished?—A part of it; it is as though the magistracy of the country were paid partly in manorial and feudal rights; it would be very difficult to separate what would be the appropriate salary of the fiscal or magisterial officer, and what was merely his hereditary possession, irrespective of official duties.

474. Then

474. Then I understand you to say that the Government consider that they have a claim upon these officers to perform their duties according to the circumstances of the time, and that they represent, therefore, a certain amount of administrative power when it is put in motion?—Yes.

475. You do not apprehend that the great breadth of pasture land can be improved, so as to render it capable of any greatly improved assessment?—No.

476. Will you now be good enough to give the Committee some explanation with regard to the state of the land revenue in Scinde. Perhaps you will first state the amount of the revenue there?—The land revenue in Scinde in 1869–70 was rather more than 410,000 l.

477. What is the system under which the land revenue is assessed in Scinde?—It differed in almost every particular from the land revenue in other parts of India. The country consisted of a broad alluvial tract, bounded on one side by a very rocky desert, and on the other by a sandy desert. In the deserts there were no crops raised, except in very rare cases, when very heavy rain fell; but they were great grazing grounds, and afforded large herds of cattle for the use of the alluvial portion which bordered the river. The whole of the alluvial portion was irrigated by canals, which filled only when the river rose, as a general rule. There were small portions which were always irrigable, but the greater portion was only irrigated during the rise of the river in the hot weather. That made a very material physical difference as compared with the rest of Western India. Then there was an historical difference, owing to the circumstances under which it was conquered by the Mahomedans. They imposed upon the Rajpoot inhabitants, who had the same fondness for land, and the same capacity for agriculture which they have in their own country, the alternative of adopting Mahomedanism or emigrating; and those who remained all adopted the Mahomedan religion, and with it some of the customs relating to land tenure; and the Government there was more centralised and oppressive than in any other part of Western India. This led to a great obliteration of and change in their customs connected with agriculture and agricultural payments; and when the country was conquered from the last dynasty, the Talpoors, the system which Sir Charles Napier found in operation was generally one of attachment of the whole of the crop by the Government. The crop was then divided, and a portion given back to the cultivator, the Government retaining a very large portion as its own revenue. This made it necessary to have a completely different revenue system from what was possible elsewhere in Western India, and at first necessitated the maintenance of the old system of taking possession of the whole of the crops annually. This was coupled with a very severe system of statute labour in clearing the canals, which was necessary to get any crop at all; and it has taken a very considerable amount of labour on the part of the Government officers to get rid of those two features, the attachment of all crops, and the system of statute labour in making the necessary clearances of the irrigation canals. At present the system has been very much assimilated to that in use in other parts of Western India, with this exception, that it was found impossible to trace the village communities in the

way in which they were traceable in other parts of India; and the country is now roughly divided into fiscal charges, which are similar in size and importance to a large village in Guzerat, or in Western India generally. A survey and assessment has been of late years introduced; it was attended with peculiar difficulties owing to the absence of the traditional land marks that had guided the Government elsewhere, and it required to be considerably modified in many important particulars; but it is now almost completed in all the three collectorates into which Scinde is divided.

478. Upon what principle, then, did the revenue survey proceed; what basis did it take in fixing the contribution?—There was a valuation of the land, and the assessment was fixed partly with reference to former demands, but more with regard to those principles which were laid down in the Despatch which has just been read.

479. How was the question of the old system of labour for irrigation disposed of in adjusting the settlement?—By extending a system of levying an extra water-cess upon all land, and requiring that all the labourers should be paid in money for the work they did.

480. Then, who is the intermediate agent of the Government for receiving the cess on the one hand and keeping the canals on the other?—There is a special canal establishment. The only feature of the statute labour which has been kept up is the obligation in case of emergency to find the men; but the Government invariably pay in cash for work done.

481. Was the settlement for the revenue made in the same manner with the reputed owner of the land in Scinde?—Yes.

482. Then, the water-cess was in proportion to the benefits which he derived from the irrigation of the district?—Yes; it was generally fixed at so much an acre, in proportion to the assessment. It, of course, was only a rough approximation, but it was found to work in practice much more favourably to the cultivator than the statute labour.

483. Is the revenue all collected now through village officers established by the Government, and native officers superintended by European collectors?—Officers analogous in grade and pay to village officers, but their charges are not limited, as in the rest of India, by the ancient village boundaries.

484. Are all public servants paid by salaries?—They are salaried officers; they are not hereditary, and have no hereditary rights.

485. Is any large portion of the revenue of Scinde granted away in perpetuity under the grants of former Governments?—There are very large jageers. The system which Sir Charles Napier found in force was a sort of feudal system, in which all service was paid for in grants of land; and it was necessary to conciliate the feudal class by continuing very large grants to them, which was done on a larger scale than in other parts of India.

486. Then, are they allowed to remain in charge of the villages, and to collect the revenue themselves, or does the Government in Scinde collect the revenue and pay them in money?—Sometimes one system and sometimes the other; there is a difference with different holders; but generally the large holders collect for themselves, and the small holders collect through the Government officers.

Sir H. B. E.
Frere, K.C.B.,
G.C.S.I.

28 March
1871.

Sir H. B. E. 487. Have any steps been taken with large holders to define the rights of the occupants under them?—Yes; in most cases the estates they hold are subject to the same survey and assessment as the Government lands.

28 March
1871.

488. So that they have no more power over the occupants, and rights of the occupants, than the Government has over other land?—No.

489. Is there any prospect of these large grants lapsing to Government; are they temporary or in perpetuity?—With few exceptions they are personal, and as lives fall in they are reduced.

490. To that extent the land revenue in Scinde would be increased?—Yes.

491. Is there much unoccupied land in Scinde capable of tillage?—There are very large tracts; but the tillage depends upon the power of irrigation, and the power of irrigation is, to some extent, limited by the height of the land above the river. If it is at all high, it is difficult to get the water to it; but that difficulty can generally be overcome by making canals on a larger scale, taking them higher up the river. A systematic irrigation, no doubt, would very greatly increase the quantity of land which could be brought under tillage.

492. But apart from great works of irrigation, and dealing only with what may be called the ordinary system of irrigation of the Scinde land, is there any large quantity of tillage land that is not now in cultivation?—Yes, a considerable quantity.

493. Population is rather sparse, then, in Scinde at present?—Yes, very sparse, compared with what it seems to have been in former times.

494. And is there any tendency now to increase that population?—Apparently the population is increasing; but there has been no census for some time.

495. Do you think that there will be a steady increase of the tilled land in Scinde?—Yes.

496. And a consequent increase of revenue?—Yes.

497. Mr. J. B. Smith.] What is the term of the assessment in Scinde?—Thirty years, generally, with shorter terms in exceptional cases. I find, on reference to the returns, that the cases in which the assessments have been declared fixed for 10 years only are very numerous.

498. Mr. Cave.] Do you include in that quantity of land which can be irrigated the Desert of Cutch?—A part of it; but the greater part of what is called the Cutch Desert is out of the reach of fresh water, and would require a very heavy expenditure to render it cultivable.

499. Is there much irrigation by machinery, as there is in Egypt, the water being raised by machinery?—It is precisely the same system; the same sort of wheel, and apparently precisely the same machine; but there is a good deal which is watered on the other system, which may be seen in Egypt, of irrigation by overflow.

500. But you say that even the land which can be irrigated, is not all tilled at present?—No.

501. Then, until the population very much increased, you would see no prospect of raising a larger revenue from the land in Scinde?—It does not depend entirely upon the increase of the agricultural population, because a great many of the pastoral tribes and those who formerly did not cultivate, have, of late years taken to cultivation, and there has been a considerable settle-

ment of non-agricultural communities upon lands which they now take up and cultivate.

502. Those lands which were formerly in pasture?—Which formerly produced very little.

503. Then the population comes from the pasture land and settles upon this arable land?—Yes.

504. Does the nomadic pastoral population pay anything towards the revenue?—Yes, there is a tax upon clarified butter, which is one of the great articles of trade in the desert, and in that part of the country they pay no other tax.

505. There is no tax upon cattle?—No.

506. And of course no land tax on the pastoral land?—No. Most of the Native States levy a tax upon cattle, but it has not been found practicable to levy it under our system. There is often a grazing tax levied in forests.

507. Did I rightly understand you to say that the system of granting jagheers is continued by us?—Not of making fresh grants, except in very rare cases, but of continuing grants which nominally are only for a single life; but in the case of particular families where there is some family claim, the case of the successor is considered, and the whole or portion of the rent free tenure is continued to the son.

508. And the State makes a fresh bargain with the successor, I suppose, in those instances?—Yes.

509. Sir C. Wingfield.] I think the primitive Hindoo landed institutions have been more seriously impaired in Scinde, probably by the Mahomedan conquest, than in almost any other part of the Bombay Presidency?—Clearly; they have been in many cases almost obliterated.

510. I think the Mahomedan invasion took place three centuries before the invasion of India by the Mahmoud of Ghuznee?—Yes.

511. Mr. Beach.] May I ask whether the amount which is charged by way of water rates for works of irrigation represents a fair interest on the outlay?—It depends very much upon the special circumstances in each case; it very often affords a very ample return.

512. When waste land is rendered capable of tillage by a work of irrigation, would the additional amount be charged by way of water rate, or would it be taken into consideration in the amount of rent which would be assessed?—Wherever it is practicable the water rate would be shown separately.

513. Mr. Fawcett.] You alluded to the possible increase in the land revenue of Scinde; I suppose that is likely to go on in the future, as in the past, gradually?—Yes, very gradually.

514. Therefore, considering that it has been a gradual increase in the land revenue during the last 15 years, speaking generally, you would say that there is likely to be about the same gradual increase in future?—Yes.

515. That, speaking generally, it would be neither very much greater nor very much less; it would be going on in a steady kind of way?—Yes.

516. So that it would be 18 per cent. increase, say, in about 15 years?—I should be sorry to fix any amount.

517. We may say about the same increase in the future as in the past?—Yes.

518. Mr. Cross.] Is the expense of the collection of revenue arising from the butter large or not?—There is very little expense; I think the whole amount of revenue was very small, some 3,000 l.,

3,000 l., and I believe there is no additional expense of establishment.

519. Mr. Eastwick.] The revenue was taken by the Ameers in kind, I suppose?—Generally.

520. Have we adopted that system or do we take it in money?—We take it all in money.

521. Do you think that that is advantageous to the ryot, or the reverse?—In some respects it is very advantageous. Its definiteness is its great advantage, and now that there is so much money diffused through the country there is no difficulty whatever in the ryot converting his grain into money; and, upon the whole, it is a great safeguard against oppression and waste of every kind. The system of taking revenue in kind was an extremely wasteful one.

522. When we came into the country there was very little money in circulation, was there not?—Very little indeed.

523. In Upper Scinde especially there has been an immense increase of cultivation, has there not, all round Shikarpoor and in that direction?—Yes, on what used to be considered desert; it was a hard clayey surface with very little vegetation of any kind upon it.

524. You would say that the revenue had risen considerably since we occupied the country?—Yes.

525. As compared with the native rule?—No, not as compared with the native rule, because under the native rule a very large sum was levied in kind; but then, as in Egypt, the ruler confounded the two sources of revenue as receiver of the land tax, and as the principal grain dealer in the country; just in the same way as the Khedive makes out of Egypt at present very much more than it would be possible to make out of it by any system of taxation.

526. But that great increase of cultivation in Upper Scinde would, of course, increase the revenue, because there was none at all there formerly?—Just so; the increase is partly due to security, and partly due to the water having been brought to parts where it appears to have been brought ages ago, but where no water was brought apparently within the last 200 years or so.

527. May we not expect a very considerable increase of revenue from that canal which is now made, or is being carried from above Roree down towards Cutch?—Yes, there is a considerable increase from that canal as it extends; it is extended only as cultivators are found to take up the land.

528. That canal and the railway will be carried from Hyderabad up towards Mooltan will, of course, very much increase the productive powers of the country?—Yes; the railway will be principally advantageous, I think, to the Punjab; but, of course, it would have some effect upon Scinde itself; but extension of irrigation is the great source from which extension of land revenue may be expected.

529. Do we now compel the villagers to clear out canals, and to perform the work they used to do?—It can hardly be said to be compulsion, because no canals are cleared except at their request; but in case of an embankment threatening to burst, or of any particular work being required in a very great hurry, there would be a levy en masse of the population to repair it.

530. Mr. Beckett Denison.] When you were Governor of Bombay, was it not the practice to call for a report of the moral and material progress

of each province under the Government?—Yes; Sir H. B. E. each collector furnished an annual report, in *Pres. K.C.B.,* which he was expected to give that information. *G.C.S.I.*

531. I suppose, from those reports, we could get any information of the progress in Scinde?—Yes.

28 March
1871.

532. When you first became acquainted with Scinde, you say that there was very great difficulty in finding money with which to pay the land tax?—The difficulty was much greater before I went there. When first the country was conquered by Sir Charles Napier, there was really very little money among the cultivators; very little money passed; everything almost was estimated in kind.

533. But was not the conversion of the native coin of the country, into what is known as the Company's rupee, a serious source of embarrassment to the cultivators, and of expense too?—It was done very gradually; for I think 12 years after the conquest, the revenue continued to be collected chiefly in kind.

534. That has all ceased, has it not?—That has ceased almost entirely.

535. And there has not been more difficulty now in Scinde in obtaining coin than there is in other parts of the Bombay Presidency?—No.

536. Did not the native rulers of Scinde exact very heavy passing dues from boats?—Yes.

537. And that was a large source of revenue to them?—Yes; in a rough way Scinde was reckoned in those times (I speak of times considerably before the conquest), as a country giving 4,000,000 l. of revenue.

538. And our own proportion of that is less than one-fourth, is it not?—Yes.

539. Mr. Grant Duff.] Altogether, you think that the prospect of our land revenue in Scinde is good, do you not?—Yes.

540. Do you think that the expenses of collection could be at all diminished?—I think not; there is less room for reduction there probably even than in Bombay, because the establishments have been calculated upon a scale of services which were considerably more restricted than those we now exact.

541. Scinde has been sometimes called "Young Egypt," does that imply too hopeful a view of its future, or not?—I think it does not; I think that most of the elements of prosperity which are to be found in Egypt are to be found in Scinde and the Valley of the Indus, higher up; but Egypt has been developed under a system of very high pressure.

542. Taking Western India as a whole, do you think that improved methods of cultivation, deeper ploughing, and so forth, will much increase the producing power of the land or not?—I believe it would; I think that there, as in this country, amateur farmers are very apt to make very serious mistakes, and that probably our collectors and revenue officers do as much harm as good by attempting to show the cultivators the way to improve their agriculture. But though the agriculture is in a state much more forward than that of most European countries, there is no doubt that it is capable of quite as much improvement as has been shown possible in our own country during the last 50 years, provided experiments are conducted with judgment by practical men.

543. But the methods of Europe will not necessarily succeed in Asia?—They would not be identical

Sir H. B. E. identical methods, but the principles would be the same; deeper ploughing in some cases; high manuring in others; and in all the use of water for irrigation.

G.S.I.
28 March
1871.

544. *Chairman.*] I suppose the real difficulty in increasing the produce in India is the difficulty of finding manure, is it not?—That is one great difficulty.

545. And the practice of burning that, which in this country we use as manure?—Yes; and hitherto very little attention has been paid to the subject of improving Indian agriculture by chemists. What has reached India in that way has been merely the reflection of what has been done in England.

546. You think that no system of mineral manuring has been attempted in India?—Nothing but a few very weak copies of what has been done in England.

547. Whilst the animal and vegetable manure is reduced to a minimum?—Yes; no doubt a good system of forestry would have a great effect in increasing the supply of manure by giving a good supply of wood fuel.

548. Mr. B. Denison.] Has Scinde been surveyed?—Yes.

549. Is it a detailed survey, village by village?—It has been divided into districts as nearly as possible the size of large villages in India, and these have been treated as fiscal divisions, in the

same way as the villages would have been in the other parts of India.

550. A geological survey has not been made?—Portions of Scinde have been examined geologically, but only a very small part. We expected to have found coal, and did find some small tertiary deposits of coal, but they are not of commercial value.

551. Mr. Fawcett.] You recognised the justice of comparing Scinde to Egypt; do you think that there is an important difference between two countries, one of which is spontaneously irrigated by nature, and the other of which is irrigated by costly works?—There is little spontaneous irrigation in Egypt.

552. Not the Nile?—The irrigation of the Nile would be very imperfect, quite as imperfect as that of the Indus, but for canals, embankments, and other great works for irrigation, apparently as old as the Pharaohs.

553. Does the Indus overflow in the same way as the Nile?—Yes.

554. *Chairman.*] Relatively, you mean, that the area that is flooded by the overflow of the Indus is about the same as that by the overflow of the Nile?—The extent of the overflow is much greater in Egypt.

555. Therefore, relatively, the artificial irrigation is greater in Scinde than in Egypt?—Yes.

Mr. ROSS DONNELLY MANGLES, called in; and Examined.

Mr. R. D.
Mangles.

556. *Chairman.*] WILL you state what offices you have held in India, and what connection you have had since with India?—I was Commissioner in the Sunderbunds. I was Secretary to the Commissioners who went to treat for peace in Ava. I was Deputy Secretary to Government in the Judicial and Revenue Departments. I was Secretary to the Board of Revenue. I was Secretary to the Government of Bengal in the Judicial and Revenue Departments. I acted as Secretary to the Government of India in the same Departments, and I was a Member of the Board of Revenue in Bengal. I became a Member of the Court of Directors in 1847, and I have been a Member of the Court of Directors of the East India Company, and a Member of the Council of India since that date.

557. Will you be good enough to state what are the several systems of land revenue now in force throughout the Bengal Presidency if there is more than one?—In Bengal proper and in Behar, and in the province of Benares there is a permanent settlement of the land revenue; and in the North Western Provinces there is a settlement generally for periods of 30 years, and the same in Orissa, which is not a permanently settled province.

558. And in the extreme Eastern Provinces, what is the system?—In the Burmese Provinces there is a different system; there is a poll-tax there.

559. We will go into that afterwards; with regard now to the permanent settlement, will you remind us of the date of it?—It was made first in 1789, and it was confirmed by the Court of Directors in 1793. It was made by Lord Cornwallis, who was the Governor General, at that time, who had very strong opinions in favour of a landed aristocracy, a body of landowners, and for that reason he very earnestly desired to

establish at once a permanent settlement of the land revenue throughout the provinces which were then subject to the British Government. Mr. Shore, afterwards Lord Teignmouth, was one of the members of his council. He had a very great knowledge of revenue matters; perhaps no man has ever had a greater knowledge of revenue matters; and yet, very late in life, I remember he says, in a minute, that he was always finding out how ignorant he was, it was so difficult and complex a subject, and how much he had to learn. However, he did know more than anybody else at that time, and perhaps more than anybody since, or as much; and he strongly urged Lord Cornwallis to delay the settlement till better information was obtained with regard to the state of the people, and with regard to the relations of the several classes to the land; and I think Mr. Shore felt very strongly the necessity of protecting the ryots and the under tenants generally; but the permanent settlement was made so hastily, that nothing or next to nothing was done with that view.

560. Then the Government dealt at once with the persons whom they found in occupation of the villages?—Yes; and who, I believe, in many cases, were not really the landowners, but had been simply the officers of the native government, who were employed to collect the revenue. They were more collectors and farmers of the revenue than what we should call in this country absolute landowners.

561-71. Only the person who paid the revenue in gross for the whole village into the Treasury was taken to be the owner?—Yes; and the settlement was made with him. Some of the zemindars, no doubt, were landed proprietors, and holders of ancient tenures; but others were mere upstaria, who had got possessed of what may be called the farmers

fixing of the revenue; that is to say, the responsibility to the Government.

572. But some, I presume, held a great many villages as representing the old native Hindoo princes of the country?—No doubt. I suppose many of them were really proprietors of land; as far as any native in India was a proprietor, for the Government had the largest share of the rent, and that had always appertained to the Government.

573. Then, many of them held very large tracts of country?—Very large indeed.

574. And they were all settled with in gross for the whole of their territory?—They were settled with in the lump, very recklessly and carelessly; so much so that many estates (we call an "estate" that which pays separately to Government, and which is separately responsible) have since disappeared, and nobody knows what has become of them; they have been swallowed up by neighbouring proprietors, and they have gone, and nobody can trace them. In other cases, I remember, that this sort of thing occurred. In one district, in Midnapore, it was found, with regard to many of the estates which were settled for as one estate, and supposed at the time to be part of the Midnapore district, that parts of them were in other districts far away from Midnapore.

575. But in the settlement with the larger proprietors, was the unit of the village maintained in a schedule to his settlement, or was it by a larger territorial division?—The whole thing was done in the lump, and very carelessly and recklessly done.

576. Without even the village unit being carefully defined?—Yes.

577. Then there was no separate revenue for those villages, but it was entirely in gross, however large the whole tenure might be?—I apprehend that in the large zemindaries it was done in the gross, without any separation, and there was no sufficient protection whatever at that time given to the ryots; but the Government, in the regulation upon which the permanent settlement was formed, reserved to themselves very carefully and very strongly the right to interfere at any period for the protection of the ryots.

578. That is of those persons holding under the individual with whom the settlement was made; you use the word ryot to represent everybody in the capacity of a sub-tenant?—Yes; properly it means only the actual cultivator of the soil, but I would use it to signify every under-tenant.

579. Were there, in point of fact, several varieties of sub-tenure under the chief landowner existing then, and still existing?—Great varieties, and they are still existing.

580. But with regard to those rights and interests, the Government took no cognisance of them at the time of settlement?—They did not at the time, except that, as I have said, there is a clause in the law of the permanent settlement retaining to the Government the right to interfere at any time for the protection of those parties; they did not protect them at the time, but they declared the right to protect them.

581. Then the whole benefit resulting from the extension of the cultivation within the area of the chief holding, accrued to the holder from the Government?—The whole benefit.

582. And no further account was taken of anything that was to be done within the holding?—No.

583. And no further assessment was to be made, whatever might happen?—No. In the laws of 1793 of the Permanent Settlement, the Government exhausted language to declare that the settlement was made in perpetuity, and that no addition should be made to it on any pretence.

584. Was there any reservation of what may be called the Parliamentary right, or the Legislative right, to raise a new tax generally for any purpose upon land?—No, there was no reservation made at that time.

585. I am speaking now of language; not whether there is, by implication, any such reservation, but whether in the language of the Act there is any such reservation?—No; they have tried very hard lately to discover it, and have failed.

586. The right depends upon the ordinary rights of Government, not on any express language?—Yes. I wish to say with regard to the permanent settlement, that it was, in my judgment, a great error on the part of Government to settle the revenue in perpetuity over an enormous tract of fertile country, which, it is to be remembered, at the time Lord Cornwallis made the permanent settlement, had been reduced to a very low state, by a frightful famine that took place in the year 1770, which is supposed to have destroyed—and, I think, is stated by Warren Hastings, in one of his Minutes, to have destroyed—ten millions of people. Some say it was supposed to have destroyed one-third of the population of Bengal, and others say that it destroyed six out of every sixteen people. The consequence of this was, that some large tracts of country fell out of cultivation, and became inhabited only by tigers and wild boars; and at the time that the permanent settlement was made a very large proportion of the country was a desert, and therefore the revenue could only be assessed upon the land which was in cultivation.

587. As a matter of fact, has there been a great increase of arable cultivation and tillage cultivation of all kinds, of the land permanently settled, since the settlement?—An enormous increase; but I hold, and I wish to state the opinion, that the permanent settlement was not only unfair on the part of the Government as towards itself, and towards the people which it represented, but it was very unfair to the people at large; for I believe the land revenue of India was a sort of common stock, and the Government share of the rental of the land no more belonged to anybody of the agricultural class, whether zemindar or ryot, or whatever he might be called, than it belonged to the merchant or the artisan or the manufacturer of the town; it was the common stock of the Government of the State for the common benefit, and they had no right whatever to give this which belonged to the whole community away to a particular class; and I think that by so doing they robbed all the rest of the community, and have made it as you see in the present day, a necessity to lay on additional taxes, property taxes, and salt taxes, and other taxes, which would not have been necessary, to that extent at any rate, if the Government had not given away the birthright of the people.

588. But apart from the errors of the past, which I think we had perhaps better not pursue further, what has been the effect of this settle-

ment as regards the relation now of the land revenue in Bengal to the income of the land which is subject to that settlement?—If you will allow me to say so, we are pursuing exactly the same mistake now, and that is why I insisted upon the point. The Government of Sir Charles Wood ordered or permitted a permanent settlement to be made of the whole of India that had not been permanently settled before. It has not been followed up, happily as yet.

589. Has not the good sense of the Governments in India made it a dead letter?—It has not been followed up certainly; and one or two spokes have been put in the wheel, which have considerably retarded, or, perhaps, prevented it, but it was a most suicidal act.

590. Can you give us any information as to the relation that the land revenue of the permanently settled provinces bears to the supposed income of the land?—It is very difficult to say; it is guess work to a very great extent, because very little is known; but when I was in the Board of Revenue I tried one or two tests that I applied to it. The Board of Revenue is a Court of Wards, and we had a good many estates of minors and of female proprietors under our charge, and those we administered as guardians, and I think that in those cases, on an average at least, the revenue of the zemindar was fully double the revenue of the State.

591. Is it correct to say that there is a constantly increasing divergence between the permanent settlement made in the last century and the present value of the different holdings?—A constantly increasing divergence. I remember one case: it was a very small estate, the revenue of which was only 100 rupees, or 10*l.* a year, and what we let it for to a farmer during the minority of the proprietor, and of course the farmer got his profit besides, was 33 times what was paid to the Government.

592. Would that have arisen from the circumstance that, in the time of the permanent settlement, the village was uncultivated?—It may have originated from one cause or another; I do not know the cause.

593. It would arise from causes of that kind?—That was probably one cause, and it might have been from carelessness, or corrupt assessment at the time.

594. You think that no sufficient means were taken to verify the propriety even of the settlement on which the permanent settlement was made?—I do.

595. Was it made on an average of past years, or on what principle was it made?—On an average of past years.

596. And at that time I presume the means of ascertaining accurately the settlement were very slight, as far as the British Government were concerned?—Yes; it was not only that this terrible famine had depopulated the country, but the country had been rack-rented on a succession of short leases till the people were very much impoverished.

597. Has there been a divergence also in the opposite direction, of the holdings becoming of less value than they were first settled for?—Certainly some have, from accidental causes; from a river washing away the land, or some causes of that sort; but those cases are very rare in comparison; and lately Government has sold a number of estates which had fallen into its own hands, and they have got very high prices for many of them.

598. But have many of the estates fallen into the hands of the Government in consequence of the holders being unable to continue to pay the revenue under the permanent settlement?—The law provided that in such cases they should be sold by auction, so that comparatively few fall into the hands of Government, but a great many estates changed hands. The zemindars were greatly sold out in the years immediately following the permanent settlement. Of those upon whom the permanent settlement was conferred, a very large number lost their estates through not paying the revenue.

599. You draw a distinction then between what you have described as occurring, and falling into the hands of Government, because the law requires, not that the Government shall become the owner in such cases, but that they shall sell it and pay the revenue out of the price?—Pay the revenue out of the price, and pay the balance to the proprietor.

600. And the person who buys becomes the absolute owner in perpetuity of the estate?—Yes; he succeeds to the same rights that the first holder had.

601. But in any of these cases has it been necessary to reduce the amount of the revenue in order to give to the holding a saleable value?—No, we never reduce.

602. No estate was permanently assessed so highly that the profit to the proprietor could not pay the revenue?—No, I believe none. I said there was great recklessness, but I believe there were no over-assessments. The first proprietors were wretched men of business, and they did not know or believe that we were so thoroughly in earnest, and that it was really intended by Lord Cornwallis that they should pay the revenue to the day; and I have often heard it said, that when a native of Bengal says he will pay a certain sum on a certain day (which was what they stipulated to do), he only means that about that time he will pay some money; but when the collectors came down upon them for a definite sum, on a certain day, they were very much surprised, and many of them had made no preparation, and the estates passed out of their hands; there was a great change of property then.

603. Then the revenue sales which have taken place may be ascribed to the inexactness and improvidence of the holders?—Yes, in regard to those early sales.

604. The effect has been to transfer the property probably into the hands of more provident people?—Yes.

605. Were the proprietary rights under this revenue system much mortgaged and dealt with?—Yes.

606. At the present time is the revenue punctually paid under the settlement?—Yes.

607. The proprietary rights are such as to secure that?—Yes; and the prices which they fetch when sold are very good. Many of the estates are sold at very large prices. Many proprietors who wish to sell their estates fall into arrear in order to let them go to the public auction, which they believe will give them the best price.

608. Is that for the purpose of giving the statutory title of a revenue sale?—Yes; it obliterates all leases granted by the man who has gone out; it throws it back to the permanent settlement. The purchaser comes in with the same rights as the man who was settled with by Lord Cornwallis.

609. Do

609. Do you mean that all of those estates are forfeited?—All leases granted by the man who sold out are forfeited.

610. But does that go back as far as the settlement by Lord Cornwallis?—I think it would; but many classes have since been protected by special laws. A very large class of tenants called putnedars, of the Rajah of Burdwan, for example, have been protected by a special law.

611. Those are persons who hold under leases in writing, and registered?—Yes.

612. There is a law which gives certain under-tenants the right to hold their tenures good against the sale by the Government?—Yes; and of late years the ryots have been more especially protected by the law, which gives a man a permanent right who has held for 12 years at the same rent. But from the time that the permanent settlement was made the laws have alternated in a very curious way. At first it was found when, as I said, the zemindars were sold in large numbers, that the zemindars complained: "You, the Government, have an absolute and indefeasible right to come down upon us to pay to a certain day, and we have not the same right and power as regards our tenants; therefore we cannot collect the revenue which you call upon us to pay. Give us equal powers, or some powers that shall enable us to collect our rents with certainty." Then the law gave this power to the zemindars; then it was found that the zemindars abused this power, and then the pendulum swung back, and laws were enacted to protect the ryots in their holdings, and to give them the power of replevying. Then it was found that the ryots abused this power as against the zemindar; and I remember one zemindar told me that he had at that time 3,000 suits against him to replevy demands which he had made, in order to prevent his collecting his rents. He said that he could not pay his revenue in consequence. It depended very much upon the character of the individual how the ryots fared. If he was a man of a soft and easy temperament, his ryots robbed him; but if he was a man of Sir Giles Overreach kind, he worried and oppressed his ryots. And the laws have gone on alternating very much, helping first one party and then the other.

613. What is the present state of the question?—I think the ryot has got very much the upper hand now; I mean that he cannot be very much wronged. This last law, which gave greater stability to a tenure of 12 years' standing, has very much strengthened the hands and position of the ryot.

614. Is it now the state of the question, that apart from special grants and leases in writing registered, the customary holding of the ryot is that of ownership, subject to the payment of his rent or revenue to the superior holder?—Yes; I do not believe that the zemindars generally consider it to be their interest to oppress their ryots. A ryot is like a good fair tenant in England. A man does not willingly get rid of him; and I do not believe that the zemindars in Bengal, as a body, do oppress or rack their ryots.

615. However, these are all transactions which in no way affect the revenue derivable from the land in the permanently settled provinces?—No; the Government comes upon the zemindars, and it knows nobody else as regards its own payment; and the revenue is paid up with extreme punctuality in Bengal.

616. Is the expense of collecting the revenue under the permanent settlement comparatively small?—Very small. I could not say what it is without book, but it is very small. The zemindars come in and pay it, because the laws have been made of late very stringent with regard to the payment, which, I believe, was in the interest of the zemindars themselves. Formerly sales that had been held for the recovery of the arrear of revenue were reversed; it was thought an act of moderation and clemency not to make the law stringent; but it was found latterly, that it was an act of real hardship to make a sale uncertain, because the seller did not get the proper and full price for the land when the purchaser did not know for certain that he would get the estate which he was bidding for. The law was, therefore, made more stringent, and it has very much decreased the number of sales, and those who do sell get a better price.

617. In the event of a great drought or famine, is there any system by which the landowner can be made to assist his subordinate owners, or does that fall in any way upon the Government?—He can only be made to do it by persuasion. Some good zemindars do it very largely and very bountifully, and others do not do it at all.

618. In the permanently settled provinces, has the Government ever been called upon to make large payments in order to maintain the country, and to preserve the population of it from famine?—Yes, at times.

619. Without being able to recoup that from the landowners?—Yes; you have no hold upon them, and if they choose to allow the ryots to starve, the Government cannot allow them to starve. But, except in the recent case of Orissa, I do not remember in my time (which goes back many years) any serious famine in Bengal. Bengal is a very happy country in that respect; it is a well watered and moist country, and not subject to drought; and we have had no serious famines in my day, except that in Orissa.

620. Are you aware whether the landowners of Bengal at the time of the permanent settlement, performed any duties to the State?—Well, they had their duties to perform with regard to the police, but they were released from those by Lord Cornwallis, and the State took upon itself the whole of the expense and management of the police.

621. Then there are no claims whatever upon any landowners to perform any service to the public?—No, I think not; they are bound to appoint and provide for paying the village constables, but nothing further.

622. Are they responsible in any way for the peace of the village?—No, I think not; I was never a judicial officer, so that I cannot answer these questions with certainty.

623. Are the holders from the Government entitled to divide their holdings?—Yes; there is the law of what is called Butwarah, under which they can divide, and do divide their estates.

624. Does the Government make a separate collection from each holding?—They call upon the collector to make this Butwarah, or division, and the collector apportions the whole revenue of the estate upon these several portions.

625. They become, then, severally liable henceforth to the Government for their share?—Yes; and a great deal of fraud was perpetrated at one time in that way. A man divided his estate, and put a dependant into the part that he wanted to

Mr. R. D.
Mangles.

1871.

get rid of, which was perhaps a salt marsh (I know that in the Chittagong district that occurred). The man got a Butwarah of his estate, and got rid of that salt marsh, which he put in the name of a dependant for the time being. I think that 12 years is the time after which Government cannot have any revision of an act of that sort; and then after these 12 years had expired, the dependant whom the zemindar had put into this salt marsh, as part of his estate, threw it up. Nobody would buy it, as it was known to be valueless, and the man got the whole of the valuable part of his estate for perhaps half or two-thirds of the revenue.

626. As a matter of fact, is the land revenue as much, or more or less, than it was at the time of the settlement of the permanently settled provinces?—It is considerably more.

627. To what causes do you attribute the increase?—There has been a great deal of what is called resumption; that is to say, the proprietors of the rent-free tenures have been obliged to pay revenue.

628. When did the Government have their attention called to the fact that in the permanently settled provinces there were estates not paying any revenue?—It was known and provided for at the time of the permanent settlement. It is distinctly stated in the law of the permanent settlement that this settlement is made irrespective of the rent-free tenures which the Government claim, and which they will look into and assess at the proper value; it was declared that the revenue was made irrespective of those holdings.

629. In the original law I think they defined accurately what grants of rent-free lands would be recognised, did they not?—Yes; there are two distinct laws of 1793, one for grants made by private individuals, that is, governor zemindars, and such like persons, and the other for royal grants.

630. And they prescribed the period?—They prescribed the period, and prescribed the mode of acting to recover the revenue.

631. And all rent-free lands that were not covered by those particular clauses were left open to revision?—They were left open to revision.

632. When did the Government begin the revision of exemptions?—They began very tardily and insufficiently very soon, I think, after the permanent settlement; but they did not begin in earnest till 1819.

633. Did they then proceed with vigour?—They then proceeded with some degree of vigour, and then they proceeded more vigorously in 1828; and altogether they have recovered a very considerable amount of revenue; I think that in the five districts which constitute the Province of Behar (there the rent-free tenures were most numerous), the Government recovered as much as 250,000*l.* a year, or 25 lacs.

634. Has that process of examination come to an end yet?—Yes; it ceased many years ago.

635. Under what circumstances?—The field was exhausted.

636. They had gone over all the exemptions?—Yes, they had gone all over.

637. Will you be good enough to state what has been the increase of the land revenue of the permanently settled provinces, from the first settlement up to the present time, and explain causes of the increase in that period?—It is very difficult to answer this question with any certainty of cor-

rectness, because since that date of the permanent settlement certain tracts, such as the Provinces of Orissa and Assam, not included in that measure, have been brought upon the rent-roll of Bengal. But I see that it is stated in the Fifth Report of the House of Commons that the revenue of Bengal in 1799 was 2,650,000*l.* Mr. Pridemore, in his evidence in 1853, said that it was then 3,500,000*l.* It has steadily increased since that time, and the amount given in the accounts rendered this year (1869-70) is 3,901,872*l.*

638. Sir (C. Wingfield.) You are, no doubt, well acquainted with all that Mr. Holt Mackenzie wrote on the subject of the Bengal settlement, and there is a very graphic passage in which he describes the settlement. I will just read it to you and ask you if that is not an accurate description, and whether you do not concur in it. He says: "Our settlements were made in haste on general surmises, on accounts never believed to be accurate, and never brought to any clear test of accuracy, on the offers of speculators and the bidding of rivals; on the suggestions of enemies; on the statements of candidates for employment, seeking credit with the Government by discoveries against the people; on information of all kinds generally worthless; the collector and community playing a game of brag, in which all knowledge was on one side and all power on the other"—I believe it is impossible to exaggerate the recklessness and carelessness, and fraud in some instances, with which the permanent settlement was made.

639. As to ascertaining anything about the component villages forming a zemindar's estate, I fancy the settlements were made very much as we made a temporary settlement, immediately after annexation, in Oude with the great talookdars, that is to say, the settlements were made with the talookdars for their aggregate estates, leaving it to them to file lists of the villages which composed those estates?—Yes.

640. The consequence of it was that it was not discovered till some time after of how many villages the estates were composed?—Yes. In the case of Midnapore it was found afterwards that some of the villages settled in a lump were at a distance of 30, 40, or 50 miles; in fact, in another district far away.

641. Sir John Shore was in favour of settling with the zemindars, but pleaded for delay for time to make inquiries, did he not?—Yes.

642. He said, "We do not know what rights in the soil there are under the zemindars"?—Yes.

643. Thus the one great defect of the Bengal settlement was that subordinate rights were overlooked?—Yes.

644. And that there would have been found very much the same rights there in Bengal as were found in other parts of India?—I could not exactly say that, because I think that there have been such long years of oppression and mismanagement, and misgovernment, before our time, as well as after our time, that those rights had been very much effaced in Bengal, and the people of Bengal have not the back-bone which the men of the upper provinces, the north-west provinces, have, and they are more submissive and more easily cowed; and the zemindars terrified and bullied, they robbed and wronged them, and I think their rights very much disappeared in Bengal.

645. But Mr. Holt Mackenzie said that he considered what are called the old cultivators in Bengal

was to be identical with the village proprietors of Upper India, and that the only difference which he could see was that the proprietary rights of the Bengal communities in the village lands were not so strongly held as, by the northern peasantry, which he attributes to the less vigorous character of the people, and that is very much what you say?—Yes.

646. And I daresay you recollect that famous minute of Lord Hastings, that was written in the year 1813, in which he says: "In all these tenures in Burdwan, in Behar, in Benares, and in Cawnpore, from what I could observe, the class of village proprietors appeared to be in a train of annihilation, and unless a remedy is speedily applied, the class will become extinct. Indeed I fear any remedy would come too late to be of any effect in the several estates of Bengal. If it were the intention of the regulations to deprive every class but the large proprietors who engage with the Government, of any share in the profit of the land, that effect has been accomplished in Bengal. No compensation can now be made for the injustice done to those who used to enjoy a share of the profits under the law of the empire, and under institutions anterior to all record of the transfer of their property to the rajahs." You quite concur in that?—Yes, I do. I doubt whether under any Asiatic government the rights of the lower classes were so well protected as that seems to intimate; but they were much better protected than they were by us.

647. And in other parts, where the peasantry were of a more warlike and vigorous character, they protected themselves?—Yes.

648. In Bengal, being of a feebleness race, they succumbed sooner?—Yes; that is exactly it.

649. I see that when Mr. Holt Mackenzie was examined before the Committee, in 1832, he said that he calculated that at that time the Government had lost three millions annually by the permanent settlement?—That is about what I said, that the zemindars had at least as much more as the Government had. And I think that is very much under the mark. I think that the Government have lost fully three millions a year.

650. If Mr. Mackenzie's estimate of three millions was correct, then the loss would now be greater, in consequence of the great rise of prices that has taken place, would it not?—No doubt it would.

651. Do not you think that all the advantages in regard to security of tenure and confidence in the Government, which flowed from the permanent settlement, would have been equally secured by a settlement for a long term of years, say, 50 years?—Quite so. I think that a 30 years' settlement would have done everything that was done by the permanent settlement. I believe that every acre of land that has been newly brought into cultivation and recovered from waste under the permanent settlement, would have been brought under cultivation by a 30 years' settlement, or by a succession of 30 years' settlements one after the other.

652. And then it would have given time to ascertain and preserve the subordinate proprietary rights?—Quite so.

653. And has it not been in your opinion one of the results of sacrificing so much revenue in Bengal that we were compelled to assess, or rather to be led into assessing our subsequently acquired territories in Upper India too highly?—Well, there was certainly in our first settlement

of the North Western Provinces great over-assessment, and it led to very great evils, and hardships, and wrongs; but you will remember that a man who was a collector, was looked upon as a good officer, and was highly in favour with the Government if he made a high settlement. We have become wiser now, and certainly the tendency of Government in all parts of India, and of all their servants, is towards very moderate assessments; but formerly, the men who made the highest assessments were thought to be the best officers.

654. When this permanent Bengal settlement was made, the basis of the calculation was to take ten-elevenths of the assumed rental, was it not?—Yes.

655. Therefore if they had really got at the rental, the assessment would have been ruinously severe?—No doubt it would.

656. And the result has been that where there was an immense deal of waste land, the assessment is ridiculously light, and where the land was pretty fully cultivated at the time, it has been a heavyish settlement?—Yes, in a few cases it has been heavy, but in the vast majority of cases, from one cause and another, the settlement has been practically very light.

657. Now it is on record in the statement of a Report of the Bengal Government, that one-half of the landed property of Bengal was sold for arrears of revenue by the year 1815?—I do not know what proportion, but I stated that a very large proportion had been so sold.

658. And with regard to the reason why so much of this land was sold, I think you described just now several causes; but I believe one of the main causes was the absence of any coercive power on the part of the landholders, to enforce their rents from their tenants?—Yes, that was one cause; and another was that many of the landholders were bad men of business, and did not understand their own affairs.

659. And most of the principal landowners in Bengal now are the descendants of the men who bought these estates at auction sales, are they not?—Yes.

660. The old gentry of the country, the old landholders who were of the ancient families, were mostly sold out?—Many of them were no doubt, but a great many still exist, especially in Behar, I take it.

661. But the effect, in short, of that permanent settlement was to involve in common ruin, most of the landholders with whom it was made, and the subordinate holders who were sacrificed to them?—Many of the landholders, I would not say most, but many.

662. You said just now that under the sale laws, when an estate is brought to auction for arrears of revenue, all under tenures created since 1793, that is to say, since the permanent settlement, are cleared away?—Yes.

663. Then you specified certain reservations made in the case of certain tenures on the Rajah of Burdwan's estate?—I only mentioned those as an example; but certain tenures have been protected by specific laws.

664. I think now, by a general law, holders of under tenures can apply and get the proportion of the Government assessment entire on the estate allotted to their several holdings, and by lodging that money can save their holdings from being involved in the sale of the estate for arrears of revenue?—I think they can. It is a law

Mr. R. D.
Mangles.

28 March
1871.

Mr. R. D. passed since my time, but I think that is the law.
Mangles.

28 March
1871.

665. Your experience and study of the Bengal permanent settlement render you very averse to repeating the experiment of a permanent settlement in any other part of India?—I did all I possibly could to resist it as a member of the Council of India, and I got very little support from my colleagues. Lord Lawrence was very strong in the opposite direction, and one or two other members of the Council; but I believe that since they have seen the consequent necessity of imposing other and bad taxes instead of that wise and good tax (for I believe that a tax upon rent is the very best tax in the world), the members of the Council have very generally come round to the opinion that to extend the permanent settlement would be a great mistake.

666. I think that minute of yours to which you refer was published in 1862; at least I saw a copy of it then?—It was published in the Parliamentary Papers.

667. Mr. Birley.] At the time of the permanent settlement by Lord Cornwallis, was the uncultivated land included as well as the cultivated?—Yes, the whole estate.

668. Whether it had gone out of cultivation or not?—Yes, and the zemindars at one time claimed the whole of the Sunderbuns (which is an enormous forest stretching down the whole delta of the Ganges to the sea) as part of their permanently settled estates.

669. When these estates fall into the hands of the Government, are they re-settled under the permanent settlement?—They have been sold of late very much by auction, and settled upon the terms of the permanent settlement; the purchaser bought the estate, subject to the rent of the permanent settlement.

670. But the Government have never introduced the plan of putting them upon some other terms of assessment?—I am not aware that they have altered the terms of those that are under the permanent settlement.

671. Has this system of selling by auction these estates ever been used by proprietors intentionally to obtain the advantage of a sale of the estates?—Yes, as it abrogated the rights of under-tenants it rendered it more desirable to a purchaser to get the estates so released from the obligation of under-tenants.

672. When you first spoke of the subject, did I rightly understand you to say that these estates were sold by auction sometimes, because in that way a better price was obtained for them owing to the rights of the under tenants being abrogated?—Yes, a man allowed his estate to fall into arrears purposely with the intention of getting it so sold that he might get the better price. It is not a common occurrence, but it has happened so occasionally; I am happy to say that there are very few sales now for the recovery of arrears of revenue since the rules have been made more stringent, and a man knows that if the sale takes place it will be confirmed, and his estate is gone; they take care to pay now.

673. Will you tell me what is the effect on cultivation of the light taxation which the permanent settlement involves; does it stimulate cultivation?—The zemindars do very little towards it. There has been a constant increase of population, and, with the increase of population, cultivation has gone on; it is self-acting.

674. But you could not attribute a great improvement in cultivation to the light taxation?—Not the least; there is no improvement in cultivation at all. The ground is only scratched. That is one of the greatest evils in Bengal, that though the settlement has been so light, the zemindars have done nothing to improve their estates. Not one man in a hundred, probably, is induced to do it; and, of course, as cultivation increased, and more ryots came in, the zemindars got better rents, and they have been satisfied with that.

675. In some cases the estate has fallen into European hands, I think?—Yes.

676. Then have you seen any great tendency to improve the cultivation?—Generally they have fallen into European hands for the purposes of indigo cultivation. Some years ago there was a very serious quarrel between the ryots and the indigo planters, the latter wishing to coerce the ryots to grow indigo at certain rates, which they did not consider so profitable as growing rice or growing other articles, consequently there was a great collision, and a great outcry against Sir John Peter Grant, who was then Governor of Bengal, because he took a humane and just view of the case.

677. But, after all, the European estates are a very small fraction of the whole, and do not influence the question much?—A very small fraction.

678. Mr. Beach.] Were the ryotwaroe settlements, made by Lord William Bentinck, applied to the provinces of Bengal?—No, because it was all settled by Lord Cornwallis many years ago.

679. Then no law was passed for the protection of the ryots till this law, which you alluded to with respect to those who had occupied the same land, for 12 years?—Yes. I told you that there was a constant alternation of laws. First, there was one in favour of the zemindar; then he was thought to be too powerful and to oppress the ryot; and then there was a law passed to give the ryots more means of resistance; and then it was found that the ryots were too powerful; and, as I told you, one man had 3,000 suits brought against him by his ryots.

680. Has the object of Lord Cornwallis been attained in very many cases; have the zemindars attained rank as landed proprietors; those, I mean, who have possessed the same estates since the permanent settlement?—They are opulent landed proprietors, and some few of them, have laid themselves out to found schools and to improve the condition of their tenantry; but I do not think that I ever heard of a zemindar who made a road, and only one or two who did anything in the way of irrigation; they have been content to receive their rents and feed upon them, and do nothing.

681. One argument that was used in favour of a permanent settlement was, that it would give the proprietors an interest in the stability of the government?—Yes, no doubt, that was Lord Lawrence's strong argument in favour of a permanent settlement of the North Western Provinces, that it would so conciliate the people, and that they would have so strong an interest in supporting the British Government, which had granted them that great privilege, that it would answer in that respect. That was his great argument, and his only argument, I think.

682. It was reputed, was it not, in the time of the rebellion in one especial case, when a district

where the permanent settlement had taken place, was most persistent in its resistance to us; I allude to Ghazee-pore?—I do not remember the fact in regard to Ghazee-pore; but this I know, that as a general rule the behaviour of the people towards the Government corresponded with the length of time that they had been under the Government.

683. In other respects the permanent settlement has been productive of no good results, inasmuch as the land revenue of the province of Bengal bears a much less proportion to the general revenue than the land revenue in other provinces does?—I think it does.

684. It is little more than one-fourth of the gross revenues, whereas in the north-western provinces it is two-thirds, and in most of the other provinces one-half?—Yes; but there is a fallacy in that, because I take it that the opium revenue is counted in the revenue of Bengal, and probably the bulk of the salt revenue; and therefore you must compare the land revenue of Bengal with the land revenue of the other parts of India, and not with the whole revenue.

685. As the receipts of the Government are not increased in the province of Bengal, where it is permanently settled in the same proportion as they are in other provinces, does the general revenue benefit by the increased prosperity of the country very much?—It was one of the arguments in favour of the extending the permanent settlement to the other provinces, that if you gave the people a fixed proprietary right, and only a certain revenue were demandable from their land, it would be easy to find other modes of taxation. I think that argument has entirely broken down, for you have the best proof possible of the failure in Bengal; you can no more get any additional revenue in Bengal than you can in any other part of the country.

686. Mr. J. B. Smith. I believe you formerly held very strong opinions upon the question of the permanent settlement?—Yes.

687. Has there not been a very great change in opinion amongst those who were in favour of a permanent settlement, and are they not now against it?—Yes, I think that nearly all my colleagues in the Indian Council now see that the permanent settlement is a mistake.

688. Is it the fact that the condition of the people in Bengal is better than it is in those places where there is no permanent settlement?—No, I do not think it is. All Bengalees are remarkably weak and depressed people, without energy, and without courage; I mean compared with the natives of other parts of India; and the Bengalee ryots are more oppressed, and I think that they are not so well off as the ryots of the North Western Provinces, which are not permanently settled.

689. Then so far as Lord Cornwallis expected that the condition of the people would be better by being under zemindars, who would have an interest in their welfare, it has proved the contrary?—I think it has.

690. They have not laid out money in improving the condition of the people?—No; as a general rule they have laid out absolutely nothing; there are a very few individual instances to the contrary.

691. But is there not from time to time a great expenditure on the part of the Government in Bengal; for instance, in the great road and in the

Ganges Canal?—That is in the North Western Provinces.

692. But is there not a Grand Trunk Road from Calcutta?—Yes.

693. Bengal must have benefited very much from that?—Yes.

694. That was a work exclusively paid for by the Government?—Yes, by the Government entirely.

695. And the zemindars contributed nothing to it?—Nothing.

696. But their revenue must have been very much improved by it?—Yes, where it goes through cultivated land; but the road was made very straight, and in Bengal the Grand Trunk Road goes for a long distance through wild country; but whenever it goes through cultivated land no doubt it has greatly improved it.

697. Then there are the railroads; they have added very largely to the value of the land, have they not?—Those are a vast improvement no doubt.

698. Do not you think that the zemindars are equitably bound to contribute something towards those expenses which have so much benefited their land?—There is no doubt that they are morally bound to do so; but the difficulty is that you have made the permanent settlement so stringent. I mean as to your promises and obligations, and what you bound yourself to do, that it is very difficult to get a penny out of them without laying yourself open, and justly open, in many cases, to a breach of faith. You have tied yourself up so tight that you cannot release yourself, and that is the great difficulty. No doubt they are bound; but you made the permanent settlement, and pledged yourself that you would take nothing more from them.

699. But you never pledged yourself to make these improvements, did you?—No, you never did, certainly; but you would punish yourselves and the country, and be bad rulers if you sat still and did not make such improvements. There is a talk of the deficit of the revenue of India; but there is no doubt that there would be no deficit at all if you did not spend money in public works. You voluntarily spend this money in public works, and therefore you create a voluntary deficit.

700. Would there be any advantage in saying, from this time forward we will make no more improvement in Bengal unless those who benefit by the improvement contribute to it?—I should be very sorry that the Government should abstain from making improvements. It would be very desirable, if you could, to persuade the zemindars to contribute. Now the other day a matter came before the Council which is exactly in point. In the Hooghly district, which is about 30 or 40 miles above Calcutta, there is an immense swamp. It was found to be very deleterious to the health of the people, as well as to the cultivation, and the Government tried to persuade the landholders to agree among themselves. The Government offered, "We will find the money to do it if you will pay us back with interest in so many years." Some of the more intelligent zemindars readily agreed, and said that they would consent to it, and would tax themselves for a time to reimburse the Government for draining this swamp, which I suppose would have added to their income very much. But they said, "We cannot get the others to consent," and the only way, as they urged upon the Government (and the Government have con-

Mr. R. D. Mangles.

28 March 1871.

Mr. B. D.
Mangles.

28 March
1871.

sented to it) to do it, is to pass an Act, like a Railway Act in this country, compelling everybody who is interested, and who will be benefited by this work, to contribute rateably towards carrying it out; and I believe that that Act has actually been passed at this moment, and the Government will execute that work, and be reimbursed by those who benefit by it. That is a case in point.

701. But is there anybody in India who would consider an Act of that kind unjust?—I dare say that those who would not contribute voluntarily, would consider it unjust; but no enlightened man considers it unjust, and it was pressed upon the Government by the enlightened part of the native community; the zemindars, who were really men of intelligence, pressed it upon the Government that they should pass such a law.

702. Mr. T. Bazley.] When the permanent settlement was first established, great public works, such as railways, were not in contemplation?—No, certainly not.

703. The land in Bengal was surrendered, but were un contemplated works also surrendered?—They bound themselves to put no more tax upon the landholders, and therefore they surrendered the means of making the public works; they could not surrender the public works themselves, for they did not exist.

704. Would it not be a very just assumption, that where a great and beneficial public work is suggested by the Government the landholders in Bengal should contribute to that new work independent of the surrender of the soil to them under the Cornwallis Treaty?—Well, as I said, it was made so strong, language was exhausted to assert that the Government would take nothing more than that permanent assessment, that it would be very difficult indeed to get more money without great risk of breach of faith, and without the certainty of being accused of breach of faith with very considerable plausibility. If the Committee look at the laws of 1793 they will see in what reiterated terms the Government declared that they would take nothing more.

705. Then you think that the Government should not make exactions for which they did not compensate the landholders in Bengal, by new public works?—Public works would be greatly for the benefit of the landholders, but it would be very difficult to persuade them to contribute to their execution, except in the exceptional cases of very intelligent men.

706. A short time ago you said that you thought rental was a fair property to be assessed for taxation?—Yes.

707. Is not the floating property of the country under the protection of the law, and should not it also be subject to exactions from the State?—No doubt, but the difficulty is to get at it. With the exception of what is got from the public servant, who is first paid his salary, and then is taxed so much per cent. on it, and from the fund holder, who has lent his money, and is taxed so much per cent. upon it, the product of the income tax in India is lamentably small; you cannot get at, or reach, or discover, in such a way, as to compel payment, the income of the people.

708. But in the abstract, you approve of the property and income tax?—I think that a property and income tax is a fair tax, but you cannot enforce it in Bengal.

709. Mr. Lyttleton.] I understand, that in the case of non-payment of land tax, the remedy on the part of the Government is sale by auction of the property?—Yes.

710. There is no seizure of crops as there is in the Western Provinces?—No.

711. It is the first step taken?—The first step, and the only step taken.

712. When is it taken?—It may be taken at every instalment that is due of the revenue.

713. Does it often happen?—No; I say that in the present day sales by auction are comparatively very rare.

714. Supposing that the opinions that you hold with regard to the non-advisability of a permanent settlement, were to become more and more spread, would it not become possible, that by means of these sales by auction, a great breadth of the land now permanently settled, might be got back again into the hands of the Government and settled on different conditions?—I think you would have to pay so much for it, that it would not be a very good bargain; you would have to pay so much to get it back, that you would be the loser.

715. In point of fact, it is not the practice of the Government, when these estates do revert to the Government, to settle them on different conditions?—No, they have not often, if ever, done it to my knowledge. I do not know that they could. They certainly now usually sell them on the zemindary tenure.

716. Is it not felt to be a hardship in some cases that on non-payment of rent, in consequence perhaps of some accident, the proprietor should be sold out?—Well, it is the bargain, and it is a very good bargain for the zemindar. The permanent settlement is an arrangement very much in favour of the landholder, and sale in default of payment is one of the conditions of it.

717. But in 1815 there was a very large selling out of zemindars?—There was; at the first, very large.

718. That is not likely to recur?—No.

719. But if it did happen, it is likely that that class of zemindars would become disaffected and disloyal subjects, is it not?—I do not see the possibility of its recurring.

720. Mr. Eastwick.] Do you think that the circumstances of the ryots in Bengal, under this permanent settlement (I am speaking now of the cultivators under the zemindars), have improved or not?—I think of late years they have improved. The law to which I have referred about the 12 years' tenure has been a cause of improvement, and in the disputes with the indigo planters, though the indigo planters were superior men from their position, the ryots made a very good fight against them in the assertion of their rights; and I think, from the long time that they have been under our Government, and from the knowledge that they can have recourse to courts of law for their defence and protection, and to the magistrates, the ryots are stronger than they were, at least I should say so.

721. Have there not been statements made by missionaries and others of the great distress of the ryots in Bengal, and their utter poverty?—I think those statements are exaggerated; I do not deny that there is poverty, but I think that upon the whole their condition has improved; that is all I meant to say.

722. The zemindars no doubt are very wealthy, I suppose?—Many of them very wealthy indeed.

723. Do

723. Do you think that they have saved money, that they hold large sums of money?—Yes; many of them a great deal of money that is employed in trade in Calcutta, which is very large, from the accumulated wealth of landholders. Most, I should say, of the native merchants in Calcutta engaged in business are also landholders.

724. Do you think that they spend a good deal of money, or that they save it?—They are a very saving people, as a general rule.

725. They do not invest money in European goods, for example?—They furnish their houses, many of them, very handsomely, and have carriages, and mirrors, and pictures, and things of that sort.

726. Would it not be possible to touch them by a horse tax or a carriage tax?—That would be a comparative trifle. I think that since my day there is what is called a wheel tax in Calcutta.

727. There being an income tax, how is it, if they have large sums invested in commerce, that you cannot touch them there?—They make their returns. The returns in this country are supposed to be very far from the truth, and in India you have even less hold upon the morality of taxpayers than you have here.

728. Although this permanent settlement is a great loss to Government, still I suppose it is for the general advantage of the country that there should be a number of rich people rather of the upper classes, as these zemindars are, with the ability of assisting the lower classes?—But they do not do it.

729. But they may be gradually brought to do it by education, may they not?—I hope they may. Some of them, I know, have done a good deal in the way of schools, and in other ways, to promote the benefit of those under them, but as a general rule they do little or nothing. The benefit in the way that the honourable Member points out has not been at all commensurate with the sacrifice that the Government has made. If they had got the full revenue from Bengal, only think what a great deal they might do in the way of public works and improvements of that kind. And they might also dispense with bad taxes; they might dispense with the income tax. I do not think it is a bad tax as taxes go, but it is very obnoxious to the people in India; it is a novelty, and therefore odious.

730. It is an old Hindoo doctrine, is it not, that the digging of wells and the building of caravanserais and such other public works, are things which bring with them a future reward: and a great many such public works were made in old time at all events, on the foundation of that belief, were they not?—Yes, and some are made still, especially at Bombay, where the rich men and merchants appear to vie with one another very much in works of public benefit.

731. You do not find that in Bengal?—Not so much, certainly, and nothing like it. I think that the Bombay people, the Parsees, and some of the Hindoo classes of Bombay are a superior people to the Bengal people, not in intellect, because I believe the Bengalee is a man of the acutest intellect of any natives of India, but in public spirit they are very deficient.

732. *Mr. Beckett Denison.*] When you say that the condition of the cultivators has very much improved of late years, do you apply that without distinction to Bengal Proper, Orissa, and Behar, or do you make a distinction between the pro-

vinces?—I do not think it very much improved, but I think it is improved. It is a matter of mere opinion; it is a thing which you can hardly test. No doubt, in Orissa that dreadful famine came, and swept off some hundred thousand.

733. But suppose that the condition varies according to the race of people; for instance, that they are much better off in Behar?—Much better; the people of Behar are a much finer and manlier people, but they are not so acute in point of intellect as the Bengalee people. I know a gentleman, a connection of my own, who was moved, as an officer, from a Bengal district to a Behar district; and he wrote to me that he found a very great inferiority in the people there, in point of acuteness and intelligence.

734. But as far as material condition goes, they are better off?—Yes, they have more backbone and more energy of character.

735. But is not one fertile source of the impoverished condition of the cultivators in Lower Bengal, where they are little better than slaves, to be found in the excessive subinfeudation of the tenure?—I think that is the case; there is more squeezing; it is like the under tenures in Ireland. It is a most singular fact, but I have seen "whole pages" written about the state of Ireland years ago, long before these recent measures, which would apply perfectly to Bengal. I remember an article in the "Edinburgh Review" upon railroads in Ireland, from which you might have taken whole pages, and changing the proper names, have applied them to Bengal.

736. Is it not the case that a very large proportion of the permanent proprietors of Bengal have permanently alienated their own rights, that is, they have sublet them for a quiet sum?—Yes, I think they have done so, very largely.

737. That they have taken advantage of the permanent settlement with the Government to permanently alienate to their subordinates?—Yes; in the case of the Rajah of Burdwan, who is the largest landowner in Bengal, there is a large proportion of his estate let permanently to his under-tenants.

738. From whom, of course, the Government have no increased revenue?—No.

739. But the Rajah of Burdwan happens, on the other hand, to be one of those who set a good example to their countrymen?—Yes, he does; he is very much above the general average.

740. An honourable Member has desired me to ask this question: Benares is a permanently settled province; have not the Government often been obliged to make the same remissions of land revenue and other concessions to the landholders in Benares, as in temporarily settled estates; thus showing that the permanent settlement does not benefit the State?—Not in my time; I have no knowledge of such cases.

741. Did I rightly understand you to say that, never within your knowledge, has an estate that has been sold, been resettled on any other terms than that of the permanent settlement in Bengal?—I do not know of an instance. I am not quite sure that the Government would have the power to do it.

742. Then the Government derive no benefit whatever from the sales, beyond the recovery of their revenue balances?—No. The Government might do this: if the Government bought an estate, they might settle it ryotwar; that is, they might settle it with the ryots and remain the proprietors themselves; but I doubt whether they

Mr. R. D. Mangley.

28 March
1871.

Mr. R. D.
Mangles.
28 March
1871.

could settle it with a man and make a fresh bargain (or at least, they never have done so to my knowledge) like the permanent settlement.

743. But does not the fact of sale extinguish all subordinate rights?—Yes; but I do not think the Government would take advantage of that to annul *bonâ fide* rights of any parties. They might settle it ryotwar; they might settle it with the ryots and become the zemindar themselves, as it were.

744. Do you know at all to what extent the permanently settled estates have changed hands by reason of the Government sales?—It would be extremely difficult, I should think, to get that information at all.

745. The Board of Revenue in Calcutta would know that?—The Board of Revenue in Calcutta would find it no doubt among their records, but it would be difficult to get at it in this country.

746. The land revenue is by law payable on a certain day before a certain hour?—Yes.

747. Is it within your knowledge that tenders of revenue prior to the fixed day have been refused?—No, certainly not.

748. Is it within your knowledge, that owing to the closing of the Government office or the collector's treasury on holidays, estates have been brought to the hammer?—I should think not, I never heard of such cases; the Board of Revenue would come down very sharply on a collector who sold an estate when the money had been tendered.

749. Mr. Grant Duff.] Am I not right in thinking that your dissent from the permanent settlement despatch of the 9th of July 1862, was laid before Parliament in a Return moved for by Mr. Vansittart in the year 1862?—Yes, I think it was.

750. Do you recollect that at the same time there was laid before Parliament a very interesting Paper by Sir John, now Lord, Lawrence, taking precisely the opposite view from you?—Yes.

751. So that the honourable Members of the Committee who will refer to that Return will be able to find both views stated with the utmost fulness?—Yes. I mentioned just now that Lord Lawrence was the man who held that view, that it would do so much to conciliate the zemindars, and to render them anxious to support the Go-

vernment, that it would counterbalance any disadvantage of loss of revenue.

752. I am right in thinking that you would consider that any honourable Member of the Committee who had read these two Papers would have the whole arguments on both sides clearly placed before him?—It would be vain of me to say that I have stated all the arguments on my side; I stated all that I could.

753. Chairman.] Are you aware that there has also been laid upon the Table a further correspondence between the Secretary of State for India and the Government of India, 1865-67, on the subject of the permanent settlement of land revenue in India, which states all that has been done in India since that despatch was sent in 1862?—Yes; but I do not think that I have seen those lists.

754. Mr. Grant Duff.] And your views as to the bearing of the permanent settlement upon the education and road cess question have also been laid before Parliament in a Return moved for by Mr. Kinnaird last year?—Yes.

755. With regard to that last matter, the bearing of the permanent settlement upon the education and road cess question, you dissented from the view that found favour with the Secretary of State in Council?—Well, I did partially, I rather gave in at last, for I thought it was so desirable that we should have it, but it was to me very questionable whether it was not a breach of faith.

756. The view that found favour with the Secretary of State in Council was, that the permanent settlement in Bengal did not bar the imposition of an education and road cess in Bengal in the way in which it was proposed to impose it?—Yes.

757. Your complaint against the land tax of Bengal is only that it was settled in a way far too unfavourable to the Government?—Yes, and that it was made permanent.

758. Have you any complaint to make against the settlement of the land tax in Bengal, except that it was too unfavourable to the Government?—No, no complaint, certainly, that it was oppressive to the zemindars, to the payers of revenue; it is most favourable to them, there is no doubt; but the claims of the ryots were overlooked and neglected.

Friday, 31st March 1871.

MEMBERS PRESENT:

Mr. Ayrton.
Sir Thomas Bezley.
Mr. Beach.
Mr. Birley.
Mr. Cave.
Mr. Cross.
Mr. Dickinson.
Mr. Grant Duff.
Mr. Eastwick.

Mr. Fawcett.
Mr. Robert Fowler.
Mr. Hermon.
Mr. Lyttelton.
Mr. McClure.
Mr. J. B. Smith.
Sir David Wedderburn.
Sir Charles Wingfield.

THE RIGHT HONOURABLE ACTON SMEE AYRTON, IN THE CHAIR.

SIR ROBERT MONTGOMERY, K.C.B., G.L.S.I., called in; and Examined.

759. *Chairman.*] WHAT offices have you held in India?—I went through all the different grades, the lower grades of the judicial and revenue departments; I then came to the superior grades, and subsequently formed a member of the Board of Administration in the Punjab.

760. In what year?—In 1851, with Sir Henry Lawrence and Sir John, now Lord, Lawrence. Then, on the Board of Administration being broken up, I was appointed Judicial Commissioner for the whole Punjab in 1852, and subsequently, after the mutiny, namely, in 1858, I was sent down to Oude as Chief Commissioner, and then subsequently I was appointed to succeed Lord Lawrence as Lieutenant Governor of the Punjab, which government I left in 1865.

761. Will you be good enough to explain to the Committee what was the state of the Punjab as regards its land revenue at the time it first fell under British rule?—To do so it will be necessary to go back for two or three years before annexation. And I may briefly say this, that when Maharajah Rungeet Sing died, in 1839, complete anarchy prevailed for six years. The army became paramount, and invaded the British territories in the year 1845. A British force was hastily collected by Lord Gough, and Lord Hardinge, as Governor General, also united with him, and four very bloody battles were fought; the battles of Moodkee, Ferozeshah, Aliwal, and Sobraon, which led to our army advancing to Lahore, and the following was the result: the territory of Julinder Doab, between the Beas and the Sutlej rivers, I think having a revenue of about 30,000 L., was ceded to the British Government, and a Council of Regency was appointed at Lahore as guardian of the young minor, Maharajah Dhuleep Sing, who is now in England. An officer was appointed to preside over the Council of Regency; that was Sir Henry Lawrence, and he had a staff of assistants also for the purpose of helping the Council of Regency in carrying out the civil administration for the young Maharajah. During that period for which the Council of Regency lasted, 1846-47, and 1847-48, the Resident in communication with the Council of Regency determined to change the

system of collecting the revenues in the Punjab. Formerly there were produce assessments; each field contributed so much produce to the purposes of the State. This was found extremely inconvenient; it led to all kinds of evil. To carry out that system was extremely difficult; it required hundreds and thousands of officials to go over the country, and the Government even then did not get perhaps their correct share of the produce. So during this period of two years Sir Henry Lawrence, with the consent of the Durbar, converted these produce payments into money payments, the same as we had in our own provinces. It was a very difficult thing to do, and the converting of it led to a very considerable decrease of revenue; but at the same time it was considered a much wholesomer, and a much better state of things. He had completed that task by the end of 1847-48, when the rebellion broke out in the Punjab.

762. Can you explain what the principle of the conversion was; how was the value of the grain payment ascertained?—I think they estimated the probable out-turn of each field; and I believe the Government were then supposed to take about a third of the produce.

763. They did not proceed then upon the actual accounts in any given number of previous years to ascertain how much had been contributed?—No doubt they kept that in view; there is no question that those former assessments were duly considered.

764. Who were the officers employed to do this; were they ordinary native officers who had been formerly engaged in collecting the land revenue, or were they special officers?—There were British officers, a staff of whom Sir Henry Lawrence had with him; I may mention their names, because they afterwards became very great and distinguished officers, and showed the great wisdom of Sir Henry Lawrence's selection. One was Lieutenant Herbert Edwardes, afterwards Sir Herbert Edwardes; one was Lieutenant Nicholson, afterwards General John Nicholson; one was Lieutenant Macgregor, now Sir George Macgregor; another was Lieutenant Taylor, now General Taylor, Mr. Bowring; and

Sir R.

1871.

and Mr. Cocks. These officers were detached with some of the native officials, and it was their duty to make the best arrangement they could, and the result was, I think, without being able to say exactly the amount, that there was a considerable reduction in the sum which the native government previously received.

765. Can you give the total amount that was then ascertained to be the revenue?

766. You were going on to state what happened after the rebellion?—The rebellion took place in 1848. Two of our officers, Anderson and Agnew, were murdered at Multan. The whole of the Sikh nation rose in rebellion, and Lord Gough advanced; the battles of Chillianwallah and Guzerat were fought, and it ended in the Punjab being made over to the British Government.

767. What was then done with reference to the land revenue?—When the province was made over to us, Lord Dalhousie, the Governor General of India, formed a Board of Administration and selected a number of officers from the North-West, and divided the whole province into divisions and districts, and I think there were six divisions and 32 districts, thus giving from about four to five districts to each division. Then for the first year we determined to continue the engagements which Sir Henry Lawrence had taken previous to the outbreak, till such period as a regular revenue assessment could be formed. It was found practically that the conversion into money-rate made by Sir Henry Lawrence and the Council of Regency was quite excessive, not from any desire on their part to make it excessive, but because there was great difficulty in the matter, and other circumstances also came in which rendered it necessary for the British Government to reduce the assessment considerably. The circumstances were these: Owing to the breaking up of the Sikh army, and the enormous hosts of armed retainers, they were all sent back to their villages, and being chiefly cultivators, they broke up a great breadth of cultivation, and the seasons were particularly propitious in 1848-49, 1849-50, and 1850-51; the consequence was, that there was an enormous quantity of grain; prices fell, and the revenue which had been fixed by the Council of Regency could not be collected, and we were obliged each year to reduce the assessment. In the meantime preparations were going on for the regular revenue settlement, conducted according to the plan pursued in the North Western Provinces, and which was the result of a great many years experience. I may say that the regular settlement commenced in 1850. It took about eight or nine years to complete the assessment of the whole Punjab; but of course some districts were completed before others; some of them were completed in 1852 and 1853, and some of them in 1854-55. Inasmuch as our instruments were limited, it was impossible to do it all at once. And now I may state, generally, what was the nature of the arrangements for this settlement; they were statistical, they were fiscal, and they were judicial. First of all the boundary of every village was defined; boundaries are very often not defined in India, and great quarrels arise in consequence. Then they were surveyed by a scientific survey; the interior area of the village was surveyed, and the land classified; the cultivated and culturable; the barren, the waste, the

sites of villages, the sites of wells; everything that a survey could delineate on the map was put down by a scientific survey. This was followed by what is called an interior survey, conducted by natives. By that survey every field was measured, its length and breadth, and its area, the name of the cultivator, the name of the owner, the quality of the soil, the crop, and the caste of the cultivators were recorded. So you had a complete map also of the whole interior arrangements of the village. Whether the fields were irrigated or unirrigated was also noticed. The class of cultivator was also noticed, the population of the village, the number of ploughs, the number of cattle, wells, tanks for irrigation; everything was laid down in detail; so that you had for each village a scientific map, and also the details filled in by the non-professional survey; and there was always a check that the non-professional one was correctly done with regard to totals, because you had the total amount of the land surveyed professionally, and the other must correspond with it.

768. What was the system of assessment that was carried out in the Punjab upon this basis?—Generally speaking, a tract of country was prepared first of all for the settlement officer. He had probably 300 villages or more in what is called the division or pergunnah. He went to the locality and spent a month or two months, according to circumstances, in that place; he visited every village; he made himself pretty well acquainted with the general agricultural condition of the villages and the tracts of country; he referred to past assessments; he looked to the condition and the character of the cultivators (for a good deal depends upon that, some cultivators being very much better than others); he looked also to the facility of irrigation, or whether irrigation could be extended; he looked also to the quantity of waste land in each village which would leave scope for future improvements, to the vicinity of markets, to whether the roads were convenient or not for exporting produce; and taking all these into consideration, seeing the people, living amongst them and talking to them, he could always come to a very fair estimate of what the assessment should be; practically it was found that there was no difficulty.

769. In arriving at this estimate of what was fair, was it considered that there were to be both profits to the cultivator, and any proprietary rights beyond the profits of cultivation, or was it considered that there were to be only the profits of cultivation?—No, the profits were considered without reference to the proprietor or cultivator.

770. What was the probable per-centage representing the proprietary rights; supposing a man holding land and paying revenue, chose to let his land to a cultivator, what would he get as a per-centage, do you suppose?—The Government in the first instance took two-thirds of the net profits after all expenses were deducted; but in a late settlement, which I will come to hereafter (the one I am now telling you about was for 12 years), they even went further and took only half; so that at this first settlement, two-thirds of the net profits of the estimated rental was considered to be what the Government ought to take.

771. Was the value taken as the estimated rental in the sense of what it would let for to a person occupying it as a tenant, or what it might be used, for having regard to the natural qualities of

of the soil?—No, as occupied by the tenant, as we found it actually existing.

772. Will you still further explain, when you speak of the irrigation that was taken into account, whether you mean what may be called the natural irrigation, the proximity of natural water to the soil, or the surface of the soil; or do you take into account large artificial works for irrigation?—Chiefly, I think, the natural irrigation. For instance, some wells are 10 feet deep, and sometimes they are from 100 to 150 feet deep.

773. And the natural flow of the river, if any were available?—If there were any there. This was one portion only of the inquiries made by the settlement officer; he had to adjust all titles to property in the village; all questions of right were determined; it was also determined how the payments were to be made by the different shareholders; all the rights as to how land was to be broken up, which was very often a very difficult thing in a village; in what proportion the different shareholders were to break it up; and every thing that could be thought of for the future management of the village was decided by the Government officer, each shareholder having a paper given him of the amount of his share, and what Government revenue he had to pay.

774. In the event of the land being unoccupied, or untitled, from want of population in the village, was an assessment put upon that land to be paid whenever it was taken into cultivation?—Certainly not.

775. What was done if the land was capable of cultivation, but from accidental circumstances at the time of the survey was not in actual cultivation?—Nothing was put upon it; but it is just possible, and even probable, that the settlement officer when making his assessment if he found 100 acres in a village cultivated, and 100 out of cultivation, in drawing his line would put rather a higher sum on the cultivated; but it was a good deal left to his discretion, and there was no principle fixed that he should do so.

776. If anyone cultivated it afterwards, the profits would go entirely to the proprietor?—Yes, for the 12 years.

777. Was the settlement made with the person who was ascertained, as far as the survey officers could discover, to be the reputed proprietor or owner of the property?—There was no difficulty about it. There they were. Generally speaking they were co-parcenary communities, and there they existed, and had been for ages and generations.

778. Do you mean that the whole villages were treated as co-parceneries?—I estimate roughly that three-fourths of the villages in the Punjab are held by co-parcenary communities; probably a fourth by single proprietors, but otherwise the whole country is held by co-parcenary communities, and they sometimes in numbers would range from 50 to 500; and, therefore, you can understand how extremely intricate the whole question of property became, and what a very great work the settlement revenue officer did when he arranged all those disputes, and fixed and recorded the right of each person.

779. Was the produce of the village jointly and severally, if I may use the phrase, liable to make good the revenue for the year?—The general plan was this: amongst co-parcenary communities each shareholder cultivated a certain portion himself, and the lands cultivated by

0.59.

tenants were thrown into a common stock. If it was sufficient to pay the revenue it went to the Government. If it was not sufficient to pay the revenue the shareholders paid the deficiency by distributing it upon their own shares, or upon their own cultivations.

780. You are distinguishing between the co-parceners who were the reputed owners, and the tenants who occupied under them as mere ordinary agricultural tenants?—Yes.

781. Were there many such agricultural tenants occupying under co-parceners in the country?—Yes, a great many.

782. Then, as between the co-parceners and such agricultural tenants, it was merely holding under contract, the terms of which were settled between themselves, and of which the Government took no cognisance?—The terms were either settled by themselves, or judicially, and, in all cases, recorded.

783. They did not go beyond the co-parceners?—No.

784. Then supposing the revenue was not paid, how would the Government obtain the revenue from the co-parceners; would they assess it upon them *pro rata* in any way, or would they make them all jointly and severally liable for the whole amount?—As I described before, the revenue was distributed upon each share. If a shareholder became a defaulter the Government would have had the power of selling his share. But that sale was never resorted to; the other shareholders, supposing the man to be in difficulty, would come forward, pay the amount, and take the share for a certain time into their possession till they were repaid.

785. Had each shareholder the liberty of selling or mortgaging his own share, with or without the consent of the co-sharers?—Yes, but the other shareholders had the right of pre-emption, the right of purchasing it; he could not sell it to an outsider so long as the other shareholders chose to take it; this kept the communities together; they did not like a stranger coming in.

786. Will you go on to the next stage in dealing with the land revenue in the Punjab?—Having described how the settlement was made, and the judicial character of that settlement, I was going to state the tenures which I have already touched upon; then I may mention perhaps as connected with the revenue, and bearing on it, the different classes of cultivators; they varied very much. The best cultivators of all were the Jats, they form the largest body of cultivators in the Punjab, and many of them were Sikhs, and they are the best cultivators. Then there is another excellent class of cultivators, Goojers, and then the Pathan cultivators, then the Dogras, they are a mixture of the Hill Rajpoots and the Rajpoots of the Plains; they are peculiar to one of the rivers of the Punjab, the Sutlej, they are excellent cultivators, and there are the Raecens, another class. I may mention that there are on record 378,997 hereditary cultivators, whose rent cannot be changed during the period of settlement, and there are upwards of a million cultivators at will.

787. They are mere occupying tenants?—Yes. Now, having stated the revenue system, perhaps it would be of some assistance to your Committee if I gave briefly a general sketch of the country, and described the variety of the surface of the Punjab, for it is very peculiar. The name of the Punjab means five rivers or five

P 2

waters; A

waters; these rivers run from the Himalaya mountains; they unite below Mooltan, and then form the Indus. The Himalaya range of mountains extends along the whole northern portions of the Punjab; from the base of these mountains, for about 50 or 80 miles, there is a most luxurious breadth of cultivation watered by the streams from the hills; nothing can exceed the richness of the cultivation there. Then along the banks of the rivers from five to 18 miles, the banks being inundated during the periodical rains, there is the very richest cultivation without any irrigation being required, very much like the Nile.

788. Is that cultivation of a single crop or two crops a year?—In most places two crops; there are no trees, but the whole of the country is one mass of cultivation, the houses and the villages being perched on high mounds scattered about, but they are extremely thriving and very prosperous. The Doab, that is, the land formed by two rivers, and which is called the Doab, is arid and barren; a very high land covered with grass and shrubs, and brushwood; hardly any cultivation exists there. But these great wastes are inhabited by nomad tribes, who have numerous flocks of cattle, buffaloes, sheep, goats, and camels, which are bred in those jungles, and with which the Cabool trade is chiefly carried on.

789. When you speak of nomad tribes, do you use that phrase in the same sense as it is used in other parts of India, to represent what may be called the aboriginal race before the Rajpoot invasion?—Very little was known about them during Maharajah Runjeet Singh's time, except that they were extremely troublesome sometimes, and caused him great difficulty.

790. Will you explain about what distance from cultivated soil, on the banks of the river, does the rise of the uncultivable soil begin, generally?—It varies from 5 to 15 miles; different rivers have got different peculiarities, but in some places they have a fringe of as much as 15 miles, and in other cases, perhaps, not more than three or four. Then, above that, you have got these high lands which are uncultivated for want of water.

791. But they have grass?—They have very rich grass, and if they only had water, they would become very valuable land.

792. Is the subsoil, then, rock?—No, it is very good soil, it only wants water; but the water is such a great distance, and sometimes brackish, that the cultivation is very sparse. Here and there the tribes have a few huts, and they manage to save a little water by embanking, and sometimes making a well with great difficulty, but they do not remain there long.

793. And in the main they subsist on natural pasturage?—Yes; there is a peculiarity also in what is called the Chuch Doab; across the Chuch Doab, which is bound by the Jelum and the Indus, runs a chain of hills, east and west, called the Salt Range. This is a most remarkable range, and extremely valuable to us. After reaching the Indus it rises up again beyond the Indus, and goes on still continuing a valuable deposit of salt. In this range we have got most valuable mines; the rock salt as dug out is pure and white as sugar, and the whole of the Punjab and Cashmere, to the north, and also Afghanistan is chiefly supplied with salt from these mines. We have done a great deal to improve the manner of excavating the salt, which was very rudely done

under the former government, and we have made large galleries, and engineering talent has been brought into play, and it is now got out without any great difficulty.

794. We will finish the land revenue, and then go back upon this question of the salt; you have not explained to us how any land revenue is collected from the uplands, or whether any revenue is collected from the uplands which you have described?—If you mean those wastes, a grazing tax is taken. With regard to those tribes who used to pay very small sums in former days, because they were too powerful and too far away, and too troublesome to pay much, but always paid a certain sum, now, that the whole has been surveyed and systematised, and we know all about them, we make them pay a certain annual sum for grazing, which, of course, is very valuable to Government.

795. Can you give any idea of the proportionate extent of the cultivatable lands that you first described as compared with the hill lands which you have lastly described in the Punjab?—I should say that the whole area of the Punjab, including the territory of the dependent chiefs, amounts to 200,000 square miles; of those 200,000 square miles, about 100,000 belong to the British Government; the exact figure is 95,768. Of those 95,000 odd square miles, 31,513, or about a third, is cultivated, and 25,000 culturable, so that there is a very large margin for future cultivation, almost as much as there is now cultivated. In fact, if canals could be brought into the centre of those Doabs which I have described, particularly two of them, the whole would be a mass of cultivation; and, therefore, there is a hope of the future revenue being increased there.

796. But, subject to great works of irrigation, the rest may be classed as natural pasturage incapable of cultivation under present circumstances?—Quite so.

797. Then, may we assume that substantially the revenue was paid out of the land which is actually under cultivation?—Out of that which is actually under cultivation.

798. Which is one-third?—One-third at the time I was telling you of.

799. What was the next stage in the settlement of the land revenue in the Punjab?—At the end of 12 years from the time each district was finished a new settlement came on; so supposing that the first settlements were completed in 1852, about 1864 they again fell in; and I may say that between 1864 and 1870 the whole of the country has come under a second settlement, and is now nearly completed. The first regular settlement was for 12 years, and this one is now for 30 years; and the difference is, that instead of taking two-thirds of the assumed net profits, we now take one-half, so that the assessments really are considerably reduced.

800. When you speak of net profits, without going into minute details, would that be understood to mean that there was an allowance for all expenses of tillage, and also an allowance for what would be considered in this country the profits of the farmer; or would it be the net returns, without anything being taken into account in the profits of the farmer?—There are certain village expenses: for instance, the village accountant gets a certain salary, the village watchman gets a certain salary; and there are other menial servants in every village who (it has been the custom from century to century) get certain allowances.

allowances. The rents of the lands which they hold are deducted, and then of the balance half is taken.

801. But, supposing that the village were let out to an annual occupant to cultivate, would the rent that he pays to the village shareholders be taken as the net return?—Yes.

802. Then it may be said that half of the net return represents the proprietary interest of the shares in the village?—Yes.

803. The other half is the revenue which they pay?—Yes. And, in this new settlement, in addition to the half net return, the proprietors have been called upon to pay 1 per cent. for roads and 1 per cent. for education; that is an arrangement of the settlement.

804. They had notice, at the time of the settlement, that they would have to pay special taxes for those purposes?—That is in addition to the half net returns that I spoke of.

805. But does it form any part of the settlement that they should be, or should not be, subject either to any general increase of assessment to meet the emergencies of the State, or that they should be subject to special assessments to meet particular necessities of the district, apart from that which you have specially mentioned?—I do not think there was any understanding of that kind. The understanding is that they are not to pay more than the assessment fixed, and the assessment now formed is plus 1 per cent. for roads and 1 per cent. for education. If more than that was taken, I think they would consider it a grievance.

806. Then the effect of adding the 1 per cent. is rather to give them a guarantee that it is to be locally spent for their benefit?—Yes; and that money is usually locally spent, or ought to be; if it is not done so, I think it is not just or fair.

807. You think that they have acquired a right by special arrangement to that application of the money?—Yes; they make no difficulty about the road assessment, because by the tenure of the villages in olden times they were obliged to construct the whole roads, which was an oppressive burden.

808. Are they relieved of that duty of compulsory road labour now?—It does not exist anywhere I think in the Punjab now; even before this late revised settlement, and where that arrangement had not existed of the 1 per cent. for roads, they themselves readily agreed to give the 1 per cent., they being freed from compulsory labour.

809. But no proclamation has been issued generally reserving the right of the Government to impose additional revenue to meet the emergencies of the State?—No.

810. Then you consider that the Government is bound in good faith during the 30 years not to increase the land revenue?—Certainly.

811. Does the 30 years' settlement equally apply to the hill districts?—Everywhere.

812. And with regard to the uncultivated, but cultivatable lands, how have they been dealt with in the 30 years' settlement?—They have the land to do exactly what they like with. Supposing that a village consists of 1,000 acres, of which 500 is cultivated, and 300 culturable, they may break that land up, and enjoy the profits for 30 years, and the Government take nothing additional.

813. Then all the benefit of the uncultivated land goes to the reputed owners for 30 years?—0.59.

Yes. I may state one thing further, with reference to those large wastes which I spoke of in the centre Doab, and which are of immense extent, that the Government, after setting apart large tracts for these nomad tribes to graze their cattle in, have separated large tracts of land, many thousands of acres which they have as it were reserved to themselves, and there is no cultivation at present in them, and no inhabitants, so that they have the right if they choose, either to sell these wastes, or when they bring water and cultivate them, to make what arrangements they can best make for the future.

814. Will you explain how you reconcile it with a system of just taxation, that if there be by the accident of the moment half a cultivable village out of cultivation, for 30 years the owners of the village should be at liberty to bring that land into cultivation without paying the same taxes as their neighbours?—Well, it is very liberal on the part of Government to allow it, but it was the system always followed in the North Western Provinces, and it was the same system which was introduced into the Punjab, and we found in the end that it was in every respect good policy; cultivation very rapidly spread, and we reap the benefit of it subsequently.

815. But during the 30 years there would seem to be this anomaly, that if by an accidental circumstance a village was fully cultivated, and therefore was paying its full revenue, another village, merely from the accident of its not being fully cultivated, would for 30 years be paying only half the revenue, though under similar circumstances?—Yes. I may mention one thing further with reference to that, that where a village was found with very small cultivation, and an enormous tract of uncultivated land, the Government, in those cases, separated off a sufficient portion, or what it considered sufficient, for the village, of the culturable land; and, as to the rest, made a separate fence round it, with a view of either making a separate arrangement for it or not, as they chose. Those are very rare cases, but that has been done in some cases.

816. They reserved, in those extreme cases, the right to bring the land under assessment whenever it might be cultivated?—Yes.

817. But they did not systematically put a land revenue upon the culturable land, to be paid when brought into cultivation?—No. Then, with this revenue system which I have been describing, the Government set themselves to do all they could to improve and extend cultivation. They made large advances to proprietors with a view of sinking wells, because wherever you can have water in that country you have good cultivation. Large advances, therefore, were made to the people to sink wells. Moreover, persons who sank wells on their own resources had a guarantee if it was waste land that for 20 years no revenue would be taken from them by the Government.

818. That would be in cases where the cultivation was the result of artificial efforts, the introduction of capital and labour?—Yes.

819. In regard to the land that we have been speaking of as culturable land, do I rightly understand that it could be brought into cultivation without any special use of capital, and that it stood really on the same footing as the ordinary cultivated land?—It would require the outlay of capital to sink wells.

820. I am speaking of the land which you have described

Sir R.
Montgomery,
R.C.B., & Co.

31 March
1871.

Sir R.
Montgomery.
K.C.B., &c. &c.
31 March
1871.

described as culturable land, though not cultivated at the time of the settlement; is that land such that it could be brought into cultivation without any special outlay of capital or works of irrigation?—It was seldom that what had been cultivated fell out of cultivation; it rarely occurred unless there had been some great oppression; as a rule, there was a very small margin of land that had fallen out of cultivation.

821. Are we to take it that the uncultivated land at the time of the settlement, represented by the 25,000 square miles, was culturable land of such a character, and so circumstanced, that it would have required special works involving capital to bring it into cultivation?—Yes, quite so.

822. Would that be the justification of allowing the person to cultivate it for any period short of 30 years under the settlement without its being taxed?—Of course, if the culturable land was contained in a village, the cultivator would have no power to break up the land without the proprietor allowing him; it would be an arrangement with the proprietor. The right of sinking a well is one of the points that prove a man to be a proprietor; no cultivator could do that without the consent of the proprietor, and then, of course, he would make his own arrangement. That is in the village; but the cases where we give persons who sink wells the right of having their land for 20 years free of rent would be in places like the Central Doab, that I spoke of, where we ourselves have marked out land; and I say that we would there give them a tract of land, if they chose to sink a well, guaranteeing them (because that was Government property) against any revenue being taken from them for 20 years.

823. What I am endeavouring to ask you to distinguish is, between land which you have described as 25,000 square miles of culturable land which was not under cultivation at the time of the settlement, but which was capable of cultivation, and the uplands, which you described as the Doab lands; and I wanted to ask you, especially with regard to the 25,000 square miles, whether that land was of such a character that the proprietor or shareholder could bring it under cultivation without embarking in it any special works of irrigation or otherwise requiring capital; whether, in short, it was land that in all other respects resembled the 35,000 square miles which were subject to assessment at the time of the settlement, and whether the one required no more capital than the other?—That is perhaps difficult to say. In some parts of the country the unculturable land is far more valuable than in others. For instance, in the Doab formed by the rivers Jelum and Chenab the waste land is far more valuable than in some of the other Doabs.

824. Do you think that any considerable part of that 25,000 square miles which you have described as culturable land could be cultivated as easily as the 35,000 square miles?—No, I think not. In the first place there is not population, and in the next place the villages and towns are distant; generally speaking they are outlying wastes far away.

825. But to put the point more closely, supposing that in the village there were 500 acres of land under cultivation at the time of the settlement, and that there were 500 acres which you have described as culturable land not under cultivation at the time of the settlement; may we take it as a general rule that those two 500

acres are identical in their circumstances as regards the facility of cultivating them?—Certainly not. The portion in the neighbourhood of the village is far more valuable than that of the extreme points.

826. But are the 500 acres not under cultivation capable of being cultivated without any extraordinary expenditure, as a rule?—The fact is, that although land may be culturable, very often it is of very inferior quality, and generally speaking in a village where there is anything like a large population they cultivate all the very best land, and leave the rather inferior kinds to be brought into cultivation as they can manage it (some is necessarily left for grazing purposes), and as the population increases, and as the necessities of the village increase. I might say also, as bearing upon the revenue of the Punjab, and bearing upon the general advance of cultivation, that one of the earliest measures of the Government there, was to make a grand canal, called the Baree Doab Canal. It was 20 years in making before it began to pay. It is now 456 miles in length with three branches, and they are now endeavouring to throw a great deal more water into the canal, with a view of extending it, perhaps, a couple of hundred miles more.

827. When were any regulations made in the Punjab, having the force of law to regulate the land revenue?—At the first introduction of our rule we were guided by the spirit of the regulations of the North Western Provinces, which were put into circulars, and circulated by the Board of Administration, which had the force of law for all engagements, and everything connected with the revenue administration; so that from the very first we had rules, and those rules have been little changed to the present time, except that they have now by the regulations of Government been legalised.

828. Now they have the force of law?—Yes.

829. And do they recognise the proprietary rights of the shareholders?—Entirely.

830. As the persons liable to the revenue, and entitled to maintain their rights against the Government?—Yes.

831. Can you give us an account of the growth of the land revenue in figures from the first period?—I can give it to a certain extent. After the mutiny in 1857, the limits of the Punjab were altered. The Delhi and the Hissar divisions were transferred to the Punjab from the North West. That was in 1858-59.

832. They formerly were a part of the North Western Provinces?—Yes. I have got a statement of the receipts of 1859-60, and a statement of the receipts of 1869-70; but these receipts include the whole of the income that is connected with the grazing tax, excise, customs, and so on. The land revenue separately in 1859-60 was 1,861,319 £.

833. That was the gross receipts?—Yes; and now in 1869-70 they are 1,995,199 £; so that there was an increase in the 10 years of 133,880 £, and that after, I may say, the second settlement has been nearly completed.

834. That is due to the re-settlement?—Yes. It would be natural to suppose that there would have been a larger increase, but the fact is, that it was found in the progress of inquiry that even our first settlement was heavy, and we reduced it in a great many cases, and, as I explained before, we took only half, instead of two-thirds;

so that, to some extent, would really account for the very small increase in 10 years in that large province.

835. Having reduced it from two-thirds to a half, and still having increased the gross result somewhat, it would seem that there had been a large increase in the general value of the agricultural produce in the Punjab?—Certainly.

836. Then it would seem that having nearly completed the 30-years' settlement, there is no expectation of any great increase of the land revenue, and as you have included in that settlement the culturable lands in the villages, the only source of increase would be the bringing what may be called the up-lands into cultivation, which have been reserved to the Government?—With reference to that I would say that there is this prospective increase. We found large Jageers, rent-free tenures in the Punjab; service grants, and personal grants. The service grants have all been done away with, a certain allowance in consideration of the persons who held them, being given to the holders; they are gradually dying off, and therefore the revenue of those lands would come back to us.

837. I see in the last account that the amount of allowances and assignments under treaties and engagements is stated at 95,334 £; is that the item which you refer to?—A good portion of that will eventually fall to the Government as they die out. Also, I may say, that there is every probability that within 30 years those large wastes in the central Doab will either be brought into cultivation by speculators who may take them, or by Government bringing water from the rivers and cultivating them. That would give an increase, but not from the estates that are actually settled.

838. Then with regard to the charges of collection, I see that they are now stated at 205,946 £ for the last year that you have mentioned; has that been an increasing charge or stationary, or has it diminished?—That is about 10 per cent. That is not a correct statement of the charges of collecting the revenue, because the native collectors of revenue are also judicial officers; they perform the great mass of the judicial work; they are also the head of the police department, and superintend the police; and, therefore, although it is put down in that way at 10 per cent., it is not so much. If their fiscal duties only could be separated from their judicial, you would arrive at the approximate amount, but inasmuch as they preside over all departments, their pay is put down, and therefore the cost of collection shows larger than it really is.

839. Do you anticipate any increase of that charge as regards the collection of the revenue?—None. The revenue is paid with the greatest facility; there is hardly an instance of distress; no sales for arrears of revenue, and the money is almost paid in to the day, showing, I think, that the revenue is an easy assessment.

840. Have there been occasions where in consequence of any general drought, you have had to make remissions of revenue?—Yes, certainly; during the time that I was in the country, we were obliged to remit revenue in a certain portion of the Punjab, near Delhi, I think as much as 20,000 £ or 30,000 £, and besides that, when famine takes place, you are obliged to advance large sums of money for the purchase of cattle and seed, and so on, which is generally repaid in

0.59.

seven or eight years. But with the exception of famines, there is no necessity now for remission.

841. But having left half the net profits to the proprietor, do you consider that the Government is under any obligation to make remissions for famine?—Not the least; but on the other hand complete ruin comes after the famine, and it is utterly impossible that they can make it up afterwards; everything goes.

842. Are the proprietors in the Punjab generally free from debt, or are their rights mortgaged to the bankers?—I should say that they are more free from debt than they are in other parts of India; still they have considerable dealings with bankers, and the cultivators generally deal very largely with regard to advances for seed, and so on, from the bankers.

843. In the case of famine, do the shareholders support their tenants when they have tenants under them, or do they throw them on the Government?—I think they would support them as far as they could; they are very charitable and very liberal, but they are not a wealthy body; these co-parcenary communities consist of very small shareholders having perhaps from five to 50 acres; they themselves are not wealthy, and they suffer like the rest when a famine comes.

844. Then the permanent settlement has not produced the beneficial effect yet of making these proprietors independent and provident so as to meet the contingencies of the future?—There is no permanent settlement in the Punjab, and the long term of settlement has not had the effect of making the proprietors independent.

845. Mr. Cave.] Do the Government recover the advances that are made during a famine?—As a rule, always; the Government suffer loss by remitting during famine the revenue, but the advances which they make for the purchase of bullocks and seeds, and so on, are recovered after a certain number of years.

846. You stated that the Government make advances for wells, for cultivation; what interest do they charge upon those advances?—No interest.

847. And in how many years do they recover the principal?—It varies; at first they generally required repayment in three or four years, but of late years they have extended it, and generally six or seven years is the period.

848. But they get no return themselves for 20 years?—Seven years is the utmost limit for which Government make advances; the 20 years limit is where persons expend money from their own resources.

849. You stated that they give guarantees that no revenue will be demanded for 20 years, with regard to the Government and with regard to the landowner. Did you mean to say the landowner?—Perhaps it would be better to say this, that, where a guarantee is given, it is generally in land belonging to Government and not to proprietors. In fact, Government would not go into a proprietor's estate and tell a man to sink a well on that proprietor's property. Practically, nothing is taken from them, because the guarantee is given for ground belonging to Government.

850. Is it a fact that a remission of all revenue from cultivatable land, not actually in cultivation, causes the cultivation to be delayed on the eve of a settlement?—It has been asserted that that is the case, and to some extent I think it is the case; but I do not think that, practically, it goes

to any very great extent. I might further explain that; it takes a long time to settle a tract of country; for instance, to settle the Punjab, it would take 10 years, and a man can hardly calculate when the settlement officer would go to a particular part; they have hardly the means of doing that, even if they wished.

851. What is the advantage of not bringing into the revenue the land which becomes cultivated during the settlement?—The great desire of the Government is to be liberal towards the shareholders, and to, in fact, make them more prosperous.

852. But is not that land brought into cultivation on account of Government works coming into the country?—I think that Government works coming into the country circulates a great deal more money and enables them to break up much more land.

853. And I suppose the price of produce is increased in the neighbourhood of a railway, for instance?—Very much.

854. Then would it be oppressive to the cultivators that the Government should retain a certain portion of that increased value?—I think that they could not do so during the period of settlement. Supposing it is for 30 years, whatever value arises to the shareholders and the proprietors, they enjoy for 30 years; the Government could take nothing; but at the end of the 30 years, on a revision of the settlement, they would very likely get a considerable increase.

855. That I quite understand with regard to land under settlement and in cultivation then, but ought that rule to apply also to land brought into cultivation afterwards on account of what has been done at great expense by the Government?—It is difficult to say that the Government brought it into cultivation; the people became more prosperous, and perhaps the population increased; they wanted more room, and they broke up more land. The Government spending money was not the direct, it was more the indirect, reason for breaking up land.

856. In case a railway went through a tract of country which was before badly supplied with means of communication, would not that be a direct reason for breaking up fresh land?—I think it would; that would be a very good thing for the proprietors, but the Government would take no increase till the expiration of the settlement.

857. And you think that they ought not?—I do think so; I think they could not.

858. Of course my question points to the difficulty of making both ends meet with regard to these expensive Government works?—Well, the Government will eventually benefit very largely, but they are ready to make this liberal arrangement with a view of future benefit.

859. You stated that 1 per cent., in addition to the revenue, was paid for education, and 1 per cent. for roads?—Yes.

860. Does that cover the expenditure upon those two items?—I am sorry to say it does not now, and there is a very general idea that if possible we should increase the per-centage for roads, but whether that can be done or not, is a question.

861. Is that 1 per cent. as much a fixed part of the settlement as the regular land revenue?—Yes, by the present arrangement.

862. Then it would be as impossible to change the one as the other during the settlement?—

Quite so; let me qualify that answer. I should say that certainly it would; but there has been a very general impression that it would be desirable if possible to get something more for roads. Still it is a very difficult question, and has really not been decided yet, but is under consideration whether you could increase for general purposes the assessment for roads.

863. Would the people be so alive to the advantage of the roads as to come voluntarily into such a change?—I should say not; as a general rule, the natives dislike roads extremely, because they consider them a source of great oppression. In the first place, probably you run a road through their land and cut up their fields; and in the second place, from the peculiar customs and habits of India, travellers press labourers and carriage; and if troops pass along, requisitions are made upon the villages for carriage and for porters, and cause a great deal of annoyance; and, although there is every desire on the part of the Government to pay them, very often the money which is given does not reach the people; and therefore, as a general rule, I do not think that they appreciate the value of roads as we would in this country.

864. Setting these inconveniences against the increase of the price of produce, you think that they would rather be without the roads?—I think so.

865. As to these co-parcenary villages, are the shares in them of various values?—Yes, running from a very small fraction upwards.

866. Are those portions cultivated by tenants' portions reserved for the whole village, or do they belong to certain individual proprietors?—That depends upon the tenure; in some places, the whole proprietary body cultivate, and there are no tenants at all, and the payment of the Government revenue is made by distributing the revenue upon the cultivation of the shareholders; in others, the cultivators belong to each shareholder, and in other cases the cultivators are general, and the money goes to the common fund. But there is an infinite variety of tenures, which it was the business of the settlement officers to record.

867. Are those tenants of the same class and race as the proprietors?—Not necessarily so, and not generally so.

868. Are they a former conquered race?—No, I do not think so; in some cases it may be so, but generally speaking I think the cultivators are a different class from the proprietors, but they are sometimes a mixture of both.

869. Sir C. Wingfield.] I see that the land revenue in the Punjab was a little under a million in 1851-52, that is before the transfer of the Delhi territory?—Yes.

870. You do not exactly know what accession of revenue the transfer of the Delhi territory brought, but it was very considerable; about 357,000 l.

871. The Punjab proper, then, the country that we took from the Sikhs, proportionately to its size pays a very small land revenue?—Very small; I think it was about 920,000 l.

872. You found very few great proprietors in the Punjab like the great proprietors of Bengal and Oude?—Very few, perhaps there are not above a dozen.

873. And these Jageerdurs were men who were not proprietors, so much so that they had assignments of the revenue?—Yes, they had assignments of the revenue; very often considerable

considerable tracts of country; they collected from the different villages, and paid a certain sum to the Government.

874. But they were not proprietors, they were assignees of the revenue?—Yes; they differed essentially from the talookdars of Oude.

875. Then you would speak of the Punjaub as essentially a country of peasant proprietors?—Yes, very much the same as the North Western Provinces.

876. In fact, you found the village communities constituted pretty much the same as the village communities of the North Western Provinces?—Very much. In some cases we found that the cultivators were almost proprietors, at least that they had the same rights as proprietors; the fact being this, that where cultivators were very scarce the old proprietors were only too glad to get them at any price, and they remained as cultivators, paying their share of the Government revenue, and very often paying hardly anything besides; they were almost, in some cases, the same as proprietors.

877. The Native government paid but little respect to the independence of the village communities?—Very little, still the communities existed.

878. I mean by that that they interfered a good deal in the management of the village lands, that is to say, that if the land was uncultivated, and the proprietor would not undertake the cultivation, they gave it to the tenants?—The native officials perhaps would sometimes do so. I do not know that it was a very common thing, no doubt it was sometimes done.

879. But the demand of the State under the Native government was so heavy generally, was it not, that the proprietors were not anxious to occupy more land than they could conveniently manage?—That was the case very often, I should say generally.

880. Did you ever meet in the Punjaub with those great co-parcenary estates, comprising not one village, but 100 villages or 50 villages, a great group of villages all cut up and divided?—Not to so great an extent as that; but I have met with estates of five or 10 villages, where all the lands were intermixed with each other. You allude to the North Western Provinces. I have never seen it in the Punjaub, to the same extent, but to a considerable extent.

881. You recollect those cases to which I refer on the borders of Oude, and which were very complicated?—Perfectly.

882. The Sikh government did not make much distinction between hereditary cultivators and tenants-at-will?—None.

883. That was a distinction rather that we introduced?—Yes, quite so. The term "hereditary cultivator" was not known before.

884. With reference to what the Chairman said just now, that it could hardly be called an equal system of settlement, if a village that contained a great deal of waste land got off for 30 years with a very low settlement, whereas a village in a high state of cultivation would have a proportionately high assessment; did you ever pursue the practice in the Punjaub, when a village was in a backward state, of fixing what was called a progressive assessment, an assessment rising at intervals of two or three years, and reaching its maximum at the 10th or 15th year?

—Yes, that has been done occasionally in the Punjaub, but practically it has not been found to

answer, and almost invariably when done it was found that they could not cultivate it sufficiently to pay the increased revenue. That was the general result, and therefore I do not think that it has been carried to a great extent in consequence, although it has been occasionally done.

885. I think it was a mode in favour many years ago, but it has been disapproved of latterly?—That is my impression; it has gone out a good deal, because it was found that from the land generally being very often poor and far away from the village, and there not being much water and other circumstances, the people did not find themselves very often equal to cultivate it to advantage.

886. Engagements are taken at the time of settlement for the cesses and the land revenue in one?—In one, but there is a detail below.

887. But there is one engagement taken for the gross amount?—Yes, so much for roads and so much for education.

888. They are additions to the land revenue; still do not you think that, practically, it frequently happens that they do come out of the land revenue in this way, that when the settlement officer has fixed the assessment in his own mind and comes to tack on to that the cesses, and finds that these cesses added to the assessment come to rather a heavier demand than he thinks the village can bear, he cuts it down?—That is quite correct, but still that is in the officer's mind, and nominally it is not so.

889. Mr. Fawcett.] You stated just now, in reply to Sir Charles Wingfield, that the Punjaub might be described as a country of peasant proprietors, and then you went on to say, if I understood you rightly, that in a few instances the cultivators had proprietary rights; therefore, would it not be more correct if you said that the Punjaub was a country of peasant cultivators rather than of peasant proprietors?—No, I do not think so; it is in a very few instances that the cultivators have become, as it were, equal with the proprietors, perhaps 1 per cent. or 2 per cent. of the cases; it does exist, and therefore I mentioned it.

890. That is the point which I want to bring out; you say that in a very few instances, namely, in 1 or 2 per cent. the cultivators become equal with the proprietors, that is, that they have proprietary rights, therefore it is the exception, as I understand you, for a cultivator to be a proprietor?—Quite the exception.

891. Then if that is the case, how can it be correctly stated that the Punjaub is a country of peasant proprietors; is it not a country of peasant cultivators?—No, I should say not.

892. As far as I understand you, you say that in 1 per cent. or 2 per cent. of the cases the cultivators are proprietors?—Perhaps it might be more correct to say, that cultivators have approached proprietors, as they do not pay more for the lands which they cultivate than the proprietors themselves, the amount that they pay being really only the Government revenue and nothing more; but those are very exceptional cases.

893. Therefore, those being exceptional cases, in the majority of cases the cultivators may have paid an amount which greatly exceeds the amount of land revenue which Government receives; I understood you to say that in exceptional cases the cultivators paid a fixed amount of rent which was equivalent to the land revenue; therefore, the ordinary case is, that they pay an amount of

Sir R.
Montgomery,

Sir R.
Montgomery,
K.C.B., G.C.S.I.

31 March
1871.

rent which varies, and which may not be equivalent to the land revenue?—Yes.

894. If that is the case that the amount of rent which the cultivator pays varies, is not that characteristic of the tenant and not of the proprietor?—Yes; it is characteristic of the tenant and not of the proprietor.

895. Therefore, that being so in the majority of cases, is it not correct to say that in the majority of instances in the Punjab the land is occupied by peasant tenants who pay varying rents, and not by peasant proprietors, who pay a fixed rate?—Perhaps so.

896. I suppose the confusion has arisen in this way; you mean to say that there are not many instances of a cultivator having worked up to the position of a proprietor?—Very few.

897. Then what proportion are the cultivators to the proprietors in the population?—I do not know the number of proprietors in the Punjab, but I have a memorandum here which shows that there are 398,997 registered hereditary tenants, and that there are 1,232,469 tenants-at-will, so that those together would be about a million and a half of tenants, but I cannot say the number of proprietors that could be ascertained.

898. Therefore, those figures would show that on each property there are about four tenants-at-will, that is the proportion approximately, is it not?—I do not know.

899. I understand it has been stated by you that the majority of those who are concerned in the cultivation of the land in the Punjab are tenants-at-will and agricultural labourers?—Yes.

900. Do you think that the increase in the aggregate amount of land revenue obtained in the next 10 years will be greater than it has been during the past 10 years?—No, I should not say so; there will be a considerable increase, but chiefly from the revenue of estates falling into Government, and possibly from new works of irrigation being made which will enable the Government to bring some lands which belong to them into cultivation. I think in that way there may be an increase, otherwise I do not see that there will be very much.

901. Speaking generally, you think that the increase in the next 10 years will be about the same as in the past?—Not so much.

902. Have you ever formed any estimate of the increase of prices in the Punjab during the last 10 years?—I know generally that they have increased enormously; I could not detail how much, but they have increased very much.

903. I have seen an estimate that general prices have increased 30 per cent. in the last 10 years; should you think that that was an exaggerated estimate?—I should think that they have increased quite as much as that.

904. According to the figures which you have stated, the land revenue has increased only about 10 per cent., has it not?—That is all.

905. How much of that do you think has been due to an increase in the prices of produce; a proportion of it, I suppose?—I think that the land revenue, which has increased in the Punjab, has increased really more from the revenue, other estates having fallen into our hands, than from any general increase in the amount of the old settlement.

906. It is obvious to you that the expenses of the Government must increase with the increase in prices, is it not?—Certainly.

907. Do you think that they must increase in anything like the same proportion as the increase in prices?—I think so.

908. About the same proportion?—I think so.

909. You look upon the land revenue, of course, as being totally different from any other kind of tax, the only tax which is not taken out of the pockets of the people?—Certainly, it is a Government rate.

910. Therefore, as there has been 30 per cent. increase in prices, and there has only been about 10 per cent. increase in the land revenue, there must have been a very great increase in the general taxation of the country, must there not?—I may say that there are a number of other things from which Government derive a considerably increased revenue every year. For instance, I may mention excise; the excise revenue increases, and will increase more, I suppose, with the increase of the population and the wealth of the people. There is an increase also from the stamp revenue; that has increased enormously, so that there would be a large addition from that. The assessed taxes are a new thing, all in addition to the land revenue; customs too have increased; all those different things together will go on increasing, while the land revenue will remain pretty fixed. The customs and the assessed taxes, and the salt, and the stamps, and the excise on spirits, will go on increasing; therefore, I think there will be a considerable increase in the revenues of the country. I may explain what I mean in this way. In 1859-60 the total receipts were 2,957,058 £; in 1869-70 the total receipts were 3,792,211 £, or an increase of 835,000 £, whereas the land revenue only increased 133,000 £.

911. Therefore, those figures prove that there has been a much greater increase in the amount obtained from the general taxation of the Punjab than from the land revenue?—Yes, much greater.

912. Mr. Birley.] Can you tell me what extent of land in the Punjab is in the hands of the Government?—They have no land themselves, with the exception of what I mentioned during the course of my examination. In those large tracts of waste lands in the Central Doab where there was really hardly any one to claim the lands, the Government, in making their maps, just threw them into some estates or other, and marked them off for themselves to give or sell, or do what they chose with hereafter.

913. But I thought I understood that some of these jugsers came into the hands of the Government?—A proprietary body exists in each village, and when a jugsar, which is composed of from two or three villages to 50, falls in to the Government, they at once make a settlement with the proprietors in the village, and make it over.

914. And is it in this way that you calculate there will be some increase in the land revenue?—Yes, from the revenue of these estates falling in.

915. Is the cultivation making as rapid progress as may be expected; that is to say, is the uncultivated land being taken up?—Yes, very rapidly; the fact of the Government having given a good title settled all disputes, settled all boundaries, arranged everything connected with the interior management of the village, has had this result, that they are extending cultivation rapidly.

916. Then

Sir R.
Montgomery,
K.C.B., G.O.S.I.

31 March
1871.

916. Then, in fact, you think all that has been done there is beneficial to the general prosperity of the country?—Certainly.

917. Can you tell me whether the agricultural produce of the Punjab is more than sufficient for the population of the Punjab?—Yes.

918. There is a surplus for exportation?—There is a good deal exported. The moment that prices rise, either down towards Bombay or down in the country, it is exported very rapidly.

919. What are the principal exports?—Grain to a very large extent; there are also other exports from the Punjab, wool, hides and horns to a very great extent; wool, grain, cotton, and sugar are great exports. The cotton of the Punjab is really inferior, and never can, I think, equal the cotton of the Bombay Presidency.

920. The natives use it themselves?—Yes; and a good deal of it goes to Afghanistan and Central Asia. When the camels come down loaded with dried fruits and silk, they generally take back sugar and cotton and English goods.

921. So that the Punjab, in fact, is rather a thriving district?—Thriving extremely, prices rising, and the people extremely prosperous; and a good deal of that is owing to the extremely liberal settlement that has been made, though you might squeeze more out of them, will more than repay the Government in 30 years.

922. You think that that has been a judicious settlement?—Yes.

923. Mr. Beach.] Has the question of a permanent settlement been entertained at all with reference to the Punjab?—It was entertained, but never carried out.

924. In fact, you think the 30 years' settlement was the most judicious one that could have been made?—By far; and I think it would be a great mistake to introduce a permanent settlement. The value of money will fall, and it is quite right that Government hereafter, at the end of 30 years, should get an increase, which they are quite entitled to, because the expenses of Government increase enormously as time goes on. As the value of money falls, Government must look, to a certain extent, to reimburse themselves hereafter from increased revenue. And I may also say this, that the people are perfectly satisfied with 30 years; under the old Government they never had more than one year; 30 years they look upon as a generation, and they are perfectly satisfied with it, and I think it would be a great mistake to make it permanent.

925. Sir D. Wedderburn.] You have spoken of the Barsee Doab Canal; I should like to have some idea as to how far that canal has increased the amount of cultivated land?—The upper part of the Barsee Doab Canal was highly irrigated from wells before the canal went there, but the object of taking the canal was to go down past Amritsur and Lahore into a very barren district of country called the Maujha, which is the country of the Sikhs. There is a certain degree of cultivation there, but an enormous quantity of waste land; that was one of the great political objects with which the canal was started, to turn the Sikhs from war and warlike feelings to agricultural pursuits; to take the canal right through their country so that the whole of it might become cultivated, and that they might return to agriculture and leave off their warlike pursuits; and now that canal has gone into a portion of the Maujha, not as far as we had hoped it would have done by this time, but the

0.59.

work is still going on, and in the course of two or three years I think it will reach a place near the bottom of the Maujha, and be continued to Moulton, so that an enormous breadth of country in the course of a few years more will be irrigated.

926. And how is that irrigation paid for?—By a water-rate, as the irrigation goes down; the Government assessment of course remains fixed on the village, but they pay a certain acreage for the water if they choose to take it; if they do not choose to take it they need not pay for it, but they are so anxious to get it that they would almost do anything to obtain it.

927. But in the other Doabs, more particularly in the Rechna Doab, would not a similar canal be productive of very beneficial effects?—Yes, no doubt.

928. You said that there was some similarity in the way in which these rivers flood the Punjab to the way in which the Nile floods Egypt. Is it the case that a fertilising loam is left behind when these rivers subside?—A fertilising deposit is left in almost all the rivers. In a great part of the Jelum river that does not exist, but in all the other rivers I may say it does.

929. And are not any of the mischievous effects produced in the Punjab by irrigation which are produced in some parts of the Jumna and Ganges Doab by the efflorescence?—With regard to that, it has not gone to any great extent yet, but in some localities it has begun to show itself, and there is some little fear that it may prevail, as yet, I believe to no great extent.

930. Mr. Hermon.] Can you tell me at all what quantity of land on the average these peasant tenants or cultivators farm?—As regards the proprietors it is quite uncertain, it varies according to circumstances. As regards the tenants, only making a guess (I daresay it could be found out, though I do not think it exists here), I should say myself about five or six acres.

931. You said that in the case of famine the Government made advances, which were repaid in seven or eight years?—Yes.

932. Do the Government make any advances for partial destruction of crops from floods or any other cause?—If any calamity occurs, such as a hailstorm, which is a very general occurrence, and breaks the whole of the crops down, the Government in such cases are very liberal in making allowances, or, shall I say, either abating or altogether striking off the revenue for the year; and in that case it becomes the duty of the Government officer to see that the proprietors do the same to the cultivators, and do not get anything from them.

933. In the cases where these advances have been made by Government they have generally speaking been promptly repaid?—Yes, always; they never break faith.

934. Mr. J. B. Smith.] Did I rightly understand you to say that there are no trees in the Punjab?—Along the fringes of the rivers, whose banks are inundated by the annual inundation, that is so; but in the other parts of the Punjab there are plenty of trees.

935. Is there no want of fuel?—The fuel is supplied from those central wastes that I spoke of, those central doabs, where there are the nomad tribes; and quantities of brushwood grow there, and it is well supplied with fuel.

936. Then there is no necessity to burn the manure for fuel?—I am sorry to say that they very often do that, but I think they are quite

alive

Sir R.
Montgomery,
K.C.B., G.C.S.I.

31 March
1871.

alive to the value of manure, and every year they become more and more so.

937. Are most of the rivers navigable?—Yes, to a certain extent, they are all navigable, but there are a great many quicksands, and the courses of the rivers are constantly changing, and navigation is done with difficulty.

938. Are the canals navigable also?—There is only one canal, the Baree Doab Canal, that has been really made, and I think within the last two years they have begun to navigate it.

939. It is used for purposes of navigation and irrigation?—Both; there was a little defect originally in constructing the bridge; they had not then towpaths under the bridges; that has been supplied, and they are now able to carry on the navigation.

940. Those canals are made by the Government?—The Government made the Baree Doab Canal; the Government has spent upwards of two millions of money on it.

941. Do you know what the returns of the canal have been so far to the revenue?—I think the last return was 78,000 *l.* gross and 37,000 *l.* net.

942. Was that the gross or the net return?—The gross return.

943. Do you know what the net return was?—Yes, 37,000 *l.*

944. Do you know whether the net return was sufficient to pay the interest on the capital?—Not yet; but the canal has not come into full operation, nor have the irrigating branches. If you have a canal, you require hundreds of irrigating branches; I do not think they have been all made yet.

945. Is it your opinion that when this canal is completed, both for navigation and irrigation, the revenue from the canal will be sufficient to pay the interest on the outlay?—I think it will; but you must bear in mind that for about 20 years whilst it was constructing, there was next to nothing received; but I think that now it will pay, though barely pay.

946. Then, in fact, the revenue derived from the canal now, after this long outlay, forms a part of the revenue?—Yes.

947. Supposing that the revenue from this canal be sufficient to pay the interest on the outlay, and something beyond that, what it pays beyond the interest on the outlay will be a sinking fund to pay off the principal?—Yes, but I do not think it has yet come to that.

948. But we may look prospectively to that?—Yes.

949. In case the income be sufficient to pay the interest and wipe off the principal, the result would be that the Government would have the canal for nothing?—In a great many years. It would take a long time, but certainly that would be the result.

950. Do you think that that is an encouragement for the Government to borrow money, and to lay out capital for such objects?—I think so. But I may also say, that with regard to canals, great discretion is necessary as to the part of the country in which the canal is made.

951. I think you said that in periods of famine, you were obliged to make advances to the farmers; is there any famine in those parts of the country where there are canals for irrigation?—I have known some distress, but not a famine there, certainly.

952. Sir Thomas Bazley.] Did you reside be-

fore the formation of the Great Canal in the Punjab?—Yes.

953. And you have witnessed a very great difference in the condition of that country since the establishment of the canal, a beneficial influence?—With regard to that I would say that where there was no water before, undoubtedly the cultivation has spread very much; but for a great portion of the tract through which the canal has been brought, there was high cultivation and irrigation before. Where the canal has reached districts in which before there was no water and no irrigation, there undoubtedly has been a very great improvement.

954. And has not the canal contributed to increase the land revenue generally?—The water-rate derived from the canal certainly has increased the revenue.

955. And you have described the land revenue as being paid with great promptitude?—Yes.

956. And much of that you would attribute probably to the benefits derived from the canal?—No doubt where a canal exists that is the case; but the canal, as we have it, reaches only a small proportion of the country. The rest of the country has not been reached.

957. But there are branches from the canal both for navigation and irrigation?—Yes; and I might also mention that along the banks of the southern portions of the river there are inundation canals made by the old governments in former times, which we have much improved, and enlarged and irrigated large tracts of country.

958. Therefore the increase of these public works would contribute to the increase of the land revenue and the prosperity of the people?—Yes, certainly very much.

959. Mr. J. B. Smith.] This settlement you say began in 1850?—Yes, the regular settlements.

960. That has been going on, I understand, ever since that time; and is it the case that the same rate is charged in 1870 as was charged in 1850?—We take less now.

961. Even though the land is more valuable?—Yes.

962. Then, at the expiration of the 30 years settlement you begin a new settlement?—Yes.

963. And that will be all upon the same principle?—Yes, but there will be a great increase of cultivation, and the land will be more valuable, and no doubt we shall get more.

964. Mr. Eastwick.] I think you said nothing about the Trans-Indus district; do we get anything from that?—That is the most western portion of the Punjab. As regards the general feature of the country, a portion of it is very well watered from the hills, but a great deal of it is very arid. The inhabitants are very warlike; they have never paid a great deal of revenue, and our assessment is very much lighter there in consideration of the people, and their habits, and their want of skill perhaps in cultivation; and, politically, it is of importance not to assess them highly.

965. Could you state exactly what the system is?—It is exactly the same system, a survey professionally, and also in detail, by measurers.

966. And is it a settlement for 30 years?—It will now be made for 30 years; the first was for 12.

967. When was the settlement for 12 years made?—It commenced in 1850 for 12 years; and then, after 12 years, that is to say, in 1862, new settlements

settlements were made, which will go on for 30 years.

968. You say that the assessment is lighter, can you say exactly what it is?—No, I cannot say exactly, but it is considerably lighter. It is politically of importance more lightly to assess those people, seeing that they are quite different in character; and, in some parts of the country they are almost independent of us, our assessment is almost a peppercorn.

969. But it is fertile soil, and if they become quite peaceful, it will produce more revenue?—Yes.

970. Is it more in the nature of a tribute, or is it assessment?—It is an assessment.

971. You said, I think, that in 1849, and for two or three years about that time, there was a very great produce of grain, and that the revenue fell in consequence of it; was it owing to the want of communication and their not being able to sell the exports and sell the grain, or do you think that the same thing would happen now?—I do not think the same thing would happen now; I think that the means of export, both by roads and by rivers which have become more used than they were, and by railroads, would enable us to export the grain.

972. With reference to Cashmere, there is a considerable import of valuable wool from Cashmere, is there not?—Yes; but the chief wool trade comes from the hills, beyond our territories, on the western frontier; it comes from Afghanistan; great quantities of wool go to Scinde from there.

973. I think you said nothing of the tea cultivation; there is considerable tea cultivation, is there not?—In the northern part of the Kangra valley, which forms part of the Julinder tract, which was ceded to us in 1846, and which I mentioned in the earlier part of my examination. There are a considerable number of tea planters who have obtained estates there, and are, on the whole, doing very well.

974. And do we assess them in exactly the same way as the other cultivators?—They got their lands with great difficulty, they bought them from the proprietors.

975. But how do we assess them?—I think exactly in the same way as other proprietors; they would not assess them more for producing tea, nor would they assess land more for producing sugar cane; they would put exactly the same rate upon the land whatever the product might be, whether it was sugar, or wheat, or cotton, or anything else. That was the general principle, viz., not to take extra rates for crops, but to assess the land according as irrigated, or unirrigated, and with reference to the soil.

976. Is this land which has been taken up for the tea plantations land that would be used for the usual crops otherwise?—Yes, and a good deal of the ground was virgin soil; they got certain tracts of forest which they themselves broke up and cultivated.

977. I think you stated that it is now 28 years since the Baree Doab Canal began to be made and that it does not pay the interest yet?—Yes.

978. Do you consider that a very great encouragement to make canals that after 20 years it does not even pay the interest on the outlay?—The fact of the matter is this, that the canal ought to have been made much faster, but the Government merely gave money as they were able to give it. As they were hard pressed they dribbled

it out. During the mutiny, of course, they did not give much; and whenever the finances were pressed they could not give very much money. It is just possible that if a company were to take up a canal of that kind, or if the Government would borrow money, they could carry the canal through in a few years.

979. And it would be much more profitable then?—It would be much more profitable then, because they would get a quicker return.

980. Is it found that, as the canal is made, the wells lose their water anywhere in the vicinity of it?—I have heard that stated, but I do not know the fact; I believe it is denied. Some people say that it is so, and others say that it is not, but, on the contrary, that the water is raised in the wells.

981. It would be an important point, would it not, if it were so?—Yes; but I am rather inclined to think it is not a fact.

982. Sir Thomas Bazley.] Though the canal itself has not paid much interest on the money, may not the country at large have received ample compensation by increased prosperity from the establishment of that canal?—No doubt a great deal of money was disseminated by the expenditure on the canal, and no doubt the people of the neighbourhood and surrounding country benefited thereby.

983. They were enabled to pay with greater facility the demands made upon them for State purposes?—No doubt they were; but I am not prepared to say that they would not have paid them, even if it had not been made. No doubt more money was disseminated by it.

984. Mr. Grant Duff.] Is the culturable land of which you spoke being rapidly taken into cultivation?—You mean, I presume, the land within the precincts of the villages. I should say it is. It would depend upon the capital that the proprietary body had. If they had money, I think that they would cultivate quickly; if they had not, I think it would for some time be uncultivated.

985. But, taking the country as a whole, it is being taken up rapidly into cultivation?—Yes; I think so.

986. I think you said that there were 25,000 square miles of that culturable land?—Yes, that would include some land that is very inferior, and some that is very good, still all classed under the head of culturable.

987. Would it be over-sanguine, do you think, to hope that before the end of the century something like half of that might be taken into cultivation?—I think that would be not over sanguine; I think that that amount would be brought into cultivation certainly before the end of the century, and before the end of the settlement, which is the same thing.

988. Then if I am right in thinking, as I think I am, that the area of Ireland is about 30,000 square miles, we have reason to hope that before the end of this century an area equal to not much less than half Ireland may be added to the land of the Punjab, from which we derive land revenue?—I think it is quite probable.

989. And it is also probable that that land which by that time will have become cultivated will be inhabited by people as prosperous as the other inhabitants of the Punjab, and all bearing their share in supporting the expenses of Government?—Certainly, the population has very rapidly increased, and is increasing now very fast.

990. Some members of the Committee seemed

Sir R.
Montgomery,
K.C.B., G.C.S.I.
31 March
1871.

Sir R.
Montgomery,
L.C.B., G.C.S.I.
31 March
1871.

to think that the Government had made rather a bad bargain with regard to this cultivable, but uncultivated land; but I suppose in a province so peculiarly situated as the Punjab an almost over-liberal system of taxation towards the cultivator would be only wise on the part of the Government?—Certainly, and I think that they have shown great wisdom in what they have done, and will be fully repaid hereafter for their present liberality.

991. This prospective increase of cultivated land in the Punjab, of which I have been speaking, is altogether irrespective of any increase to the cultivable, and therefore taxable land of the Punjab that may accrue from operations of the Government, or by private speculators in the arid parts of the country, which you class as being under their present circumstances uncultivable?—Quite irrespective of that.

992. *Chairman.*] Can you give us any general view of the relative prices of agricultural produce in the Punjab as compared, for example, with the Presidency of Bombay?—I could not state that.

993. Can you state what during the last 20 years has been the general rate of increase of prices of agricultural produce in the Punjab?—I can only say this, that they really vary so extremely from year to year, partly owing to whether the rains have been abundant, or whether have been less abundant, that it is very difficult to say with anything like certainty what the increase has been.

994. But allowing for fluctuations for climate, has there been a general enhancement of the prices of agricultural produce do you consider?—I think so certainly, because the native consumers who are not agriculturists complain very much of the enormous rise of prices. There used to be a common saying amongst them, that in former times they would get a camel-load of grain for a rupee, that is for 2s., and now it costs them 8s., showing how very much prices have risen.

995. We may take it that there has been a very large increase in prices, but you cannot at this moment tell us what relation the present prices bear to the prices nearer the sea coast?—No.

996. Can you tell us whether there has been any considerable increase in the rate of wages in the last 20 years?—Considerable; the wages of the common agricultural labourer have nearly doubled.

997. On the re-settlement of the land revenue therefore, assuming this increase to be maintained, the money amount of the land revenue would be very considerably increased, without increasing the ratio that was established at the last settlement?—Certainly, owing to the spread of cultivation.

998. But owing also to the general enhancement of prices?—Yes.

999. *Mr. Grant Duff.*] We cannot look forward I am afraid to any great diminution, if we have a diminution at all, in the cost of collection?—I think not.

1000. *Mr. Fawcett.*] You alluded in reply to a question from the Honourable Member for Fife, to the fact that it was probable that an area, equal to half Ireland, would be brought into cultivation within 20 years; is that estimate based on what has taken place in the past, and what is taking place in the present time?—I think that judging from the great increase that has taken place since

annexation, we may fairly look forward to that, now that there has been a settlement for 30 years, that good titles have been given to estates, that there is a fixity of demand, that every person will do his best to cultivate and extend cultivation as much as he can, particularly as he himself will get the full benefit of it.

1001. Have you stated the amount that has been brought into cultivation during the last 20 years?—No, we have no record of that; it might be possible to find out what it has been since the first regular settlement to the present time, but there is no record of that that I am aware of.

1002. Then it is your estimate that a quantity of land equal to half of Ireland will be brought into cultivation, but you do not know what the rate is at which culturable land has been brought into cultivation; it is not based on figures?—It is not based on figures.

1003. You alluded to complaints of the native consumers arising from the great increase of prices that has taken place; should you say that the native consumers, independently of the agriculturists, are really better off now than they were 10 or 20 years since, bearing in mind the great increase in prices?—I think that generally they are, but in some places, like Lahore, where there was a court in former days and large sums of money were spent, and Armitsur, I think, perhaps they are not so well off; but I should say that, on the whole, the general population of consumers are better off than they were before.

1004. You said that agricultural wages had nearly doubled, and that grain had in some cases increased 400 per cent. in price?—Allow me to say that that was an old native saying; I did not say so myself.

1005. Do you think that it was an incorrect saying?—I think greatly exaggerated.

1006. Can you give any estimate of the increase in the price of grain?—It varies so much really with the season that it is very difficult to say; but, generally speaking, there is no doubt that when we first went to the Punjab, flour, which was the great article of consumption of the country, used generally to sell at 24 and 25 seers for the rupee, and I think now you rarely get more than 16 or 17 seers; but that again fluctuates; if the rain comes down as they wish, the country is overflowing with grain.

1007. As there has been a very considerable rise in prices, of course the increase in wages does not represent altogether the increase in prosperity; not necessarily so?—The fact is, that we have not introduced great public works; we have been constructing roads, building barracks, making canals, and making railroads; so much is there a demand now for labour that that has raised the rate of wages very much, independent of anything else.

1008. You referred to the local advantage which the canal in the Punjab had conferred; it has conferred a great local advantage, has it not?—I think so.

1009. But the canal has been made by money not contributed from the locality, but from the Imperial Exchequer of India?—Yes.

1010. The canal is not paying?—The canal is not paying at present.

1011. Therefore the general revenues of India have contributed, in order to benefit the locality, capital for which they have not obtained a proper remuneration?—That is quite the case.

1012. Therefore, in carrying out this policy of public works, it ought to be carefully borne in mind that money is contributed by the general body of the people of India, and not the locality?—Yes.

1013. Mr. Birley.] What is the superficial measure of land corresponding with our English acre, or what is the assessment upon land in rupees in the Punjaub to compare it with our English rent?—The assessment falls per English acre upon the cultivation throughout the Punjaub 1 rupee, 1 anna, and 3 pies on the cultivated land. I suppose that would be 2s. 2d. or 2s. 2½d.

And it falls on the cultivated and culturable land at 10 annas and 2 pies per acre; and it falls on the total area at 5 annas and 4 pies, which is not a very heavy assessment.

1014. Sir C. Wingfield.] Do not you call that a very light assessment indeed?—Yes; there is no reason to complain of the British Government.

1015. Mr. McClure.] Can you give any idea what the proprietors charge the tenants?—It varies extremely, according to the soil, and so on; the rates are not so high in the Punjaub as they are in the North Western Provinces. I would say they are more than double the revenue rates.

Sir R.
Montgomery,
K.C.B., G.C.S.I.

31 March
1871.

Mr. ROBERT ANSTRUTHER DALYELL, called in; and Examined.

1016. Chairman.] WHAT office do you hold in India?—I have been 20 years in the service. I was at first employed in a subordinate revenue appointment, in a central district; then in a superior appointment of the same class, in a southern district; and afterwards in a semi-political and semi-revenue appointment, in a northern district; but for the last 10 years I have been at head-quarters, for seven years in the secretariate of the Board of Revenue, and for about two and a half in the Government secretariate at Madras.

1017. Will you state shortly what are the different systems which now prevail in the Madras Presidency?—It may be said, generally, that the system prevailing is the ryotwarree system, but about a third of the Presidency is held on a permanent settlement by zemindars and inamdars.

1018. Will you describe briefly which are the parts so held?—The north, generally speaking, is where the permanently settled estates are situated, but there are also a few large ones in the south, and in all districts there are usually a considerable number of inam tenures.

1019. That is to say, free from revenue or favourably assessed?—Yes.

1020. Then with regard to what you call the ryotwarree system, which I understand to be the assessment of the individual owner of property, as contra-distinguished from the owner of a whole village, is that the same as we have heard described as applicable to Bombay, or is it peculiar to Madras, and if so will you explain in what respect?—I believe it to be the same as in Bombay, that is to say, each holder of the land is dealt with separately.

1021. Will you state how the settlement has been made, and how it is now made; is it permanent or temporary upon the ryotwarree system?—So far as the ryotwarree parts of the country are concerned it is a temporary system, that is to say, it is for periods in no case in excess of 30 years.

1022. When did the 30 years' settlement begin?—In different parts of the country, at different periods, as the new Settlement Department has progressed. They have made each settlement for 30 years from the date on which it was completed.

1023. But how long has it taken, or is it now complete?—It is not nearly completed for the whole Presidency.

1024. When did it begin?—Some of the settlements began about nine years ago, the first of them.

1025. What progress has been made in the way of proportion of the whole settlement?—

I could not say without referring to figures, but it is but a small proportion of the whole Presidency that has been re-settled.

1026. How long do you think it will take to complete the 30 years' settlement?—I should think at least 20 years more—to go through the whole Presidency.

1027. It will about finish by the time it is necessary to begin again with a re-settlement?—Yes.

1028. Is this 30 years' settlement carried on under the supervision of European officers, with the assistance of native officers?—By European officers, with the assistance of native officers.

1029. Are there any special rules for the 30 years' settlement by way of instruction, or is it done by general instructions?—Yes, general instructions are laid down for the officers. After the country has been demarcated, boundaries marked out and surveys made, the Settlement Department officers class the land with reference to the quality of the soil; then measures are taken to ascertain the produce of each class of soil, and deductions are made for cost of cultivation, and cost of carrying to market, and other matters; and finally the net produce is ascertained, as nearly as possible, and half that is taken to be the Government share of the produce; that half share is then commuted into money on the average prices of a series of years.

1030. To arrive shortly at what you call the net produce, is that the sum that a proprietor would get as rent if he were to let his land to a farmer or cultivator?—No, usually, a very much smaller amount than such a rent; he would obtain a much larger amount from a tenant than he pays to the Government.

1031. But the net produce before it is halved is what I am speaking of; in your estimate of net produce, is that the sum that the land would yield to a proprietor if it were let to a farmer to cultivate, or is it more than that?—He would certainly obtain a rent equal to the value of the whole net produce, of which he would pay half to the Government.

1032. In other words, I want to ascertain from you whether in using the term "net produce," all the deductions are made to represent the capital and industry and reasonable profits of cultivation?—All the cost of cultivation is deducted before the net profits are arrived at.

1033. But does that include any allowance to the person who cultivates for his own maintenance?—All the labour is calculated as if it were hired labour.

1034. It is all the expense, including the labour of the cultivator himself?—Yes, all that is taken into

Mr.
R.A. Dalryell.

Mr. into account before you arrive at the net pro-
R.A. Dalgell, Esq.

1035. Then the half that the Government take
31 March leaves half net profit, which represents the pro-
1871. prietary right?—Yes, the value of the right of
ownership which all the ryots have in their land.

1036. What may be called their rent?—Yes,
if they were to let their land, they would get
really a much larger sum than the money value
of half the net produce as arrived at by the
Settlement Department, but nominally that would
be their rent.

1037. In arranging this 30 years' settlement,
have all the lands capable of cultivation been taken
into account, or is an assessment put upon the land
to be paid of course only when the land is culti-
vated?—In each village a certain proportion of
the cultivable land which was waste at the time
of survey, has been surveyed and assessed. Such
portion as the department thought would be
taken up in the next few years after the settle-
ment; but it has been found in many districts
that more than that quantity has been taken up,
and measures are being taken to survey all
such excesses.

1038. Then the Government has reserved to
itself the right of assessing any land that was
not under cultivation, and assessable at the time
when the 30 years' settlement was made?—Yes.

1039. Therefore, to that extent the assessment
of any village is capable of being increased as
cultivation increases?—Yes.

1040. So far as the permanent settlement has
gone, has it been found that there is much culti-
vatable land not under cultivation in the villages?
—Yes, there is a large proportion of cultivable
land still waste, but not good land; all the good
land is taken up, but the increase in the cultiva-
tion in the past few years shows that every year
a large quantity of waste land is taken up as the
people become richer.

1041. When you say waste land, you mean
land that is capable of being cultivated, but was
not cultivated at the time of the assessment?—
Yes.

1042. And will that make an important in-
crease in the revenues as regards the 30 years'
settlement?—Yes, every year we are obtaining a
large increase of revenue in that way.

1043. What means are taken to check this
taking up of the land not included in the assess-
ment?—In every village there is an accountant,
one of whose duties is to send in a statement of
the cultivation every year, so that his accounts
would show the increase each year in the cultiva-
tion of the village.

1044. Then with regard to the land that was
assessed, or the territory that was assessed from
year to year, or liable to be assessed from year to
year, on what principle is that now assessed?—
You refer to the old assessments that have not
come under the 30 years' settlement. They have
been variously settled at different times, and they
remain under these settlements until taken in
hand by the new department. Occasionally re-
ductions in the rates have been made. When
the Government found that the assessments were
too high, and that good land was allowed to go
out of cultivation, temporary arrangements were
made, reducing the rates.

1045. Is there any systematic assessment at
short intervals of the lands not subject to the 30
years' settlement?—None, beyond the temporary
arrangements just referred to.

1046. Are they still paying the old revenue,
and have no increases been made?—The rates
on the land have never been increased. The
revenue of a village has often increased to some
extent, from the area of the cultivated land
having been enlarged, but the rates of assessment
have not been raised anywhere.

1047. On the permanent settlement has the
rate of assessment been increased?—No; the
permanently settled estates, of course, have all
remained at the same rate of assessment as that
on which they were originally permanently
settled.

1048. I mean in introducing the 30 years' set-
tlement to a village, such as you have described,
has the settlement generally resulted in a dimi-
nution or increase of the assessment?—In most
cases, at first, in a small reduction of the existing
settlement, but always in the course of two or
three years in an increase in consequence of ex-
tended cultivation. All the rates are adjusted
and made more equitable by these revisions of
the assessment, and therefore immediately they
are finished more land is taken up.

1049. Are settlements made always with the
ostensible or reputed owners?—Yes, with the
ryot reputed to be in possession; we consider the
ryot to be the owner of his land.

1050. But the ryot is not necessarily the occu-
pant of the land, is he?—Not necessarily; in the
great majority of cases, however, he is. I think
we have about two and a-quarter million ryots,
and a million tenants.

1051. Those are occupants from year to year,
or otherwise, under particular contracts?—Yes,
under particular contracts with the ryot owners;
usually half the gross produce is paid as rent.

1052. But in collecting the land revenue, you
take no notice of an occupant of that kind; you
make your assessment with the person who is the
reputed proprietor or owner?—Yes.

1053. Do you anticipate any increase in the
revenue from any other source, except the taking
up of land which is not in cultivation?—At the
end of the new 30 years' settlements there would
be an increase, if the assessment should be again
revised with reference to prices; of course the
prices at the end of the 30 years would be so
much higher than the prices upon which the
former commutation was made, that the rates
would come out very much higher.

1054. That is assuming that prices continued
to rise?—Yes, or even if they remained at present
rates, or if they did not fall very much.

1055. Has there been a great rise of prices
generally, of agricultural produce in the Madras
Presidency?—An enormous rise.

1056. Will you explain then how it is that in
passing from the yearly settlement to the 30
years' settlement there is not a great increase of
revenue, if there has been that great increase of
prices?—It is in consequence of the commutation
of the grain values of the land, into money,
having been made on the average prices of a very
long series of years, consequently the high prices
during the last 10 or 15 years are quite swamped
by the low prices of the, perhaps, 50 years
before.

1057. Do you mean that for arriving at an
estimate of the prices for the 30 years' settlement
they do not take the average of a few years, but
a long average?—An average of 60 or 70 years,
usually as long a series as they could obtain. It
has varied in different settlements, but owing to

the sacrifice of revenue necessarily resulting from such a system, it has recently been laid down by the Government, that, whenever possible, the 20 years previous to the date of the settlement is to be the series upon which the average price is to be taken; and consequently, in future settlements, the assessment will be much fairer to the Government.

1058. And that 20 years, for some little time past, would embrace the period before the rise of prices, would it not?—About five years of that period, at present, as prices were not high until 1855. I think about 1850 or 1851 the rise in prices commenced. Between 1840 and 1850 the average price of the second sort rice, which is the staple grain, was 155 rupees per garree, that is equal to about 17s. the British quarter. Then, the average price from 1855 to 1865 was very much higher, more than double, namely, 321 rupees, and the present price is 383 rupees; so that prices have considerably more than doubled during the last 20 years.

1059. Then, notwithstanding, that as regards the present settlement for 30 years, the Government have taken no advantage of it?—Only a small advantage, only to the extent to which the high prices of recent years have affected the average price at which the commutation price of each settlement was fixed. Of course, now as the commutation rate is to be fixed upon a range of prices of only 20 years, the rate will be much higher, and the advantage taken will be so much the greater.

1060. Can you explain how it was that the attention of the Government was not called to the circumstance of the rise of prices at the beginning of the 30 years' settlement, in order to make a more equal assessment?—A great discretion was left to the settlement officer in the matter of the settlement, and he was enjoined always to make it very moderate. The experience of the Government had shown that all reductions of assessment had usually resulted in a large increase of revenue owing to increased cultivation, and, consequently, they were very chary of admitting or sanctioning any settlement that would have resulted in any increase of the existing rates.

1061. Were great complaints made in Madras as to the extreme oppressiveness of the old system?—In old days, no doubt there were such complaints, between 1840 and 1850; but virtually the rise in prices has remedied that state of affairs.

1062. Mr. *Heron*.] The increase in prices would not be double in the ports, would it?—In Madras itself the average price, per garree, of second sort rice, from 1814 to 1855, was 190 rupees, and from 1855 to 1865 it was 327 rupees.

1063. *Chairman*.] Can you state what was the reputed proportion of the Government revenue to the supposed net profits, previously to the permanent settlement under the ryotwarree system?—It used to be considered equal to a third of the gross produce, but it varied very much in different districts; theoretically the idea, was $33\frac{1}{3}$ per cent. of the gross produce.

1064. Your idea is that the reputed oppressiveness of the land revenue in Madras has been corrected by the rise in prices?—Yes, entirely; even money assessments are certainly lower now than they were when prices were only half what they are at present.

1065. Do you mean lower per acre?—The money rate per acre is considerably lower now 0.59.

than when produce was half the present price, so that the landowner is so far in a better position.

1066. Then in the prosecution of the 30 years' settlement you do not anticipate any further reduction of the land revenue?—Certainly not.

1067. Do you hope for much increase as you proceed?—Not very much, I think, from increased rates.

1068. You only look to increase from the taking up of land for cultivation?—Yes, principally to that. The Government would be loath to raise the existing rates very much; they might raise them slightly in some districts, but I think we shall always look principally to the extension of cultivation for our increase of revenue.

1069. Can you state what is the estimated amount of land under cultivation, and the amount of land culturable, but not under cultivation, under the ryotwarree settlement in the Madras Presidency?—In 1855 there were, speaking roughly, 10,000,000 acres under cultivation; in 1860-61 the area had risen to 14,000,000 acres, in 1865 to 16,000,000 acres, and in 1869-70, the last year for which we have received returns, to 17,000,000 acres. These figures refer to the ryotwarree portions of 17 districts. Of two districts we have no returns of cultivation, as they have never been surveyed.

1070. Can you tell us how much more cultivable land within those districts is still untaken up?—This can be obtained from the Returns of the Board of Revenue; but I believe I should be within the mark if I placed it at 25 per cent. on the present area of cultivation.

1071. Can you give us any general account of the land revenue in the ryotwarree districts?—I have not got it separately, but I can give you roughly what it would reach. The permanently settled revenue from estates you may put down at half-a-million; and I think the inam quit-rent at something less than a quarter. Deduct three-quarters of a million from the gross, and the balance would be the ryotwarree revenue. The gross revenue in 1855 was about three and a-half millions sterling; in 1860, 4,000,000*l.*; in 1855 4,250,000*l.*, and in 1869-70, nearly 4,500,000*l.* Taking three-quarters of a million from those sums would give you the amount obtained from ryotwarree settlements.

1072. But the increase is almost exclusively due to taking up new land, and bringing it into cultivation?—Yes.

1073. With regard to the zemindary or village holdings, are they very extensive in Madras?—No, there are a few large estates, but only half-a-million is paid by such estates out of our land revenue of four and a-half millions sterling.

1074. But in area are they not very large?—Yes, some are very extensive; for the largest estate, the zemindary of Vizianagram, the assessment to the Government, I think, is about 50,000*l.*

1075. Can you give the total extent of the land held in that way?—Several estates have not been surveyed; but, possibly, I may find an estimate of what the gross area has been. I believe one-fourth of the Presidency would be a fair rough estimate.

1076. In regard to these estimates is the settlement made with the villages, and the assessment put upon each village, or upon the entire holding of the individual, whether there are several villages, or only one?—The original system on which the permanent settlement was

1871.

made

Mr.
R.A. Dalryell.
31 March
1871.

made of these estates varied very much. In some districts careful estimates were made of the assets, and a certain allowance was made for the zemindar, and the assessments fixed permanently in one sum on the estate. Then, in other cases, where the old chieftains of the country were in possession, they paid, and continue now to pay, a sort of tribute, fixed with reference to what they paid before, and not with reference to what they collect.

1077. In these cases did the Government take any returns of occupants under the proprietor?—They guarded their interests to a certain extent in the enactments that were passed at the time, during the earlier years of the present century.

1078. Recognising proprietary rights in the sub-holders?—Well, it is difficult to say that; the regulations are rather contradictory, and finally, a regulation was passed in 1822 which declared that these regulations did not define, limit, or infringe upon the rights of either party; leaving it, therefore, to the courts to decide in all cases.

1079. In the Revenue Department the Government has no cognisance of anything behind the proprietor, from whom they receive the revenue permanently?—A recent Act makes the collector the judge in certain matters between the zemindar and his tenant.

1080. Not as the revenue officer?—As being the most convenient officer to settle the matter, it is left to him.

1081. But that in no way affects the revenue of the Government?—It does not affect the revenue in any way; merely the position of the tenant towards the zemindar is determined in such suits.

1082. The Government has no claim therefore in respect of any land brought into cultivation within the villages so permanently assessed?—No.

1083. Therefore, the limit of the Government is absolutely defined in all these zemindary estates?—Yes.

1084. Can you tell us briefly what is the total extent of the country held in that way?—I think about one-third, speaking roughly, including the rent-free tenures as well as the zemindary estates; from that one-third of the country you can expect no increase of revenue.

1085. With regard to those who are inam holders, or persons paying less than the regular revenue, do any of them engage to perform any service instead?—The Commission just brought to a close has commuted these services for a small increase of quit-rent, so that all services of that kind, military services and such like, are done away with, but the village service still continues. Village service inams have not been interfered with.

1086. And they still perform the services?—Yes, and the inams are merely recorded.

1087. The Government has now no claim for service itself upon any of the landowners?—Only for village service they have such a claim upon the accountant, the head man of the village, the village watchman, and on the man who looks after the water works, and occasionally, in some villages, on other persons for revenue or police service.

1088. Have any steps been taken in Madras to ascertain whether land has escaped being assessed to the revenue?—The inam commission has gone carefully into all exemptions from revenue.

1089. All claims for exemptions, too, were inquired into?—Yes, and settled.

1090. So that there is nothing more to be expected from land of that kind?—No, the operations of the Commission resulted in about half-a-million tenures, I think, assessed at about a million of money, being settled. The old quit-rent upon them amounted to about 100,000 £, and that sum has been about doubled by the Commission by the operation of settlement, the commutation of service, and so on.

1091. The Government have added about 100,000 £ in those cases?—Yes, and they have given permanency of title to all these landholders, so that it has been a satisfactory arrangement, to both parties. Briefly, lands bearing a nominal assessment of about a million sterling, and held on uncertain titles on the payment of only one-tenth of that sum, now pay about two-tenths, and are held on good titles.

1092. Is there any extent of territory in Madras now, which may be called waste land, beyond the limits of the settlement capable of being cultivated and assessed, what may be called hill and jungle?—We consider that all land in Madras is within the limits of some village. I could not give you the quantity of hill and jungle lands. Much has never been surveyed.

1093. We may take it that all the upland and hills are considered as the common lands of some village for the purpose of pasture?—Yes, speaking generally.

1094. And therefore there is no land now used for natural pasture which the Government can take and grant out?—The Government consider that they have a right to all waste lands if required by them; the only right that the villagers have, beyond a common right of pasturage, is a first right to cultivate. If the occupants of a village refuse to take the land for cultivation, and another person is willing to take it, although he may not be an occupant of the village, he is entitled to do so.

1095. If there is any land now in a state of primitive pasture and any person comes forward and desires to cultivate it and tenders a certain assessment, the Government has power to grant it if the villagers do not agree to take it up for the same assessment?—Yes, but this rule applies to the ryotwarce parts of the country only.

1096. Do the zemindars extend their rights to much of the uncultivated land?—Yes, large tracts of forests, hills, and so on, are in the hands of zemindars.

1097. Mr. Cave.] Do you include in those waste lands within the limits of the villages, the Neilgherry Hills, for instance?—Yes, no doubt there are certain villages on the hills which may be taken to include every part of them; you may say generally that every acre of land is in the limits of some village, although I dare say it would be occasionally difficult to identify large jungles with particular villages.

1098. You state that prices have risen very much, have wages of labour risen also?—The greater portion of the labour of the country is paid in grain wages, nearly all the agricultural labour is paid in that way, so that really the bulk of the wages of the country are not affected by prices; but the wages that are paid in money, I think, have not increased in quite the same ratio as prices. About four years ago it was ascertained by the Board of Revenue that all agricultural labourers were still paid in grain, and that their grain wages had not risen materially.

of late years; as to the other classes of labourers paid in coin, it was ascertained that their wages had risen considerably, and that the increase had kept pace with the enhanced price of food. Compared with former rates, wages were said to be in some cases double what they formerly were, but the general proportion of increase was 50 per cent., and only in a few cases had the increase been as small as 25 per cent.

1099. Is there not another element in the Madras Presidency which may be considered to raise the wages of labour, that is to say, emigration?—Yes, that has done so to some extent no doubt, and also the execution of large public works and the construction of railways.

1100. Has emigration to the West Indies and the Mauritius materially raised the rate of wages?—No, it has not been considerable enough to influence the price of labour; but no doubt the large public works and the great expenditure of money on such works and on railways during the last 10 years have been an element in raising the rate of wages.

1101. There has also been emigration, I think, to Pondicherry?—There has been a good deal of emigration to French colonies through Pondicherry.

1102. Would you consider it fair that the proprietors of lands should now surrender to the Government part of this very large increase of prices?—Well, it would be fair, but I am not sure that it would be politic to require it, I would rather take from them what the Government may need by indirect means.

1103. What has caused this rise in prices?—Partly of course the depreciation of the precious metals by the Australian gold discoveries, for a large quantity of gold finds its way to India; then the development of trade and the construction of railways and roads have also had a great deal to do with it, and the general progress of the people and the improvement of their social position have also tended to the same end.

1104. Would you consider that the construction of railways and roads has been the chief cause or not?—I should say rather the depreciation of metals. It is however a difficult question to determine, and I should not like to express a decided opinion on it.

1105. In so far as those works constructed by Government have been the cause, the Government ought to reap some benefit, ought it not?—They should reap some benefit no doubt.

1106. But you think it would not be politic to interfere, in the fact you could not interfere with the settlements already in existence?—You could not interfere with the existing ones, but even in making the new settlements which we are now making, I think it would be impolitic to raise the money rates much beyond what they are now; I would rather obtain what we require from the people by other means.

1107. Is there any rule preventing the Government from imposing a special cess to meet any special expenditure?—No, that is reserved in all the settlements. There is a cess for roads, and it is now under discussion to have a general cess for local purposes of all kinds. I think the Bill has been passed, or is about to be passed by the Local Council at Madras.

1108. Then the Government has a perfect right to put on a special cess for special purposes in the middle of a settlement?—Yes, there is no guarantee about that; the guarantee is merely

that the land revenue is to be fixed at certain rates for the period of the new settlement, and these cesses for local purposes have been considered always as separate from the land revenue.

1109. Have railways been considered local purposes?—No; railways and large trunk roads are always considered to be not local, but Imperial works.

1110. And works of irrigation?—Large works of irrigation are also imperial; small works of irrigation would, perhaps, be considered local, but it is difficult to draw a hard and fast line of distinction.

1111. Are there any railways in Madras made by the Government now?—None as yet.

1112. Sir C. Wingfield.] The permanent settlement was ordered to be introduced into the Madras territory very shortly after the conclusion of the permanent settlement by Lord Cornwallis?—Yes.

1113. I see that it had extended to about one-third of the Madras territory before it was stopped?—I dare say it had, but I cannot state positively.

1114. And the idea then ran so strongly in favour of a permanent settlement, and a permanent settlement with zemindars, that I think the orders were that, even should there be no zemindars, the lands were to be sold by auction to any one who would buy them?—In a considerable part of the presidency that course was followed with the idea of creating a rich landed proprietary body.

1115. It was very much done round Madras?—In the Madras or Chingleput, and Salem districts, and in parts of others.

1116. But the majority of those men who bought these lands, I think, failed?—A great number of them failed, and the lands were resumed and re-settled on the ryotwary system.

1117. At that time it was perfectly well known from the previous reports of the Madras officers, that proprietary communities on the model of those in the North West prevailed in all these districts?—I think it has been ascertained by recent inquiries, I am not sure, that it was known at that time.

1118. Mr. Place reported the fact at the close of the last century, did he not?—There were reports by Mr. Place, and I believe he opposed the permanent settlement.

1119. And protests were made that you were selling the rights of the indigenous proprietors of the soil?—Yes, I think the correspondence of that period shows that some correspondence of the kind took place, but the Government of the day decided that the Government had the proprietary right in the land.

1120. At that time the Government, I think, enunciated the doctrine that the only proprietor of land in India was the State?—Yes, by one of the regulations of that day.

1121. The preamble of the Madras Regulation, 31 of 1802, is as follows: "Whereas the ruling power in the provinces now subject to the Government Fort Saint George, in conformity with the ancient usages of this country reserved to itself, and exercised the actual proprietary right of lands of every description"—That is what I refer to.

1122. Chairman.] I suppose if they had written the truth in those days, they would have written that the Government never had the proprietary right

Mr.
R.A. Dalgell.

1871.

Mr.
• R.A. Dalgell.
—
31 March
1871.

right in the soil of India?—It is difficult to say. In places where we succeeded the Mahomedan Government, it is possible that we may have had the proprietary right. The rates that they obtained from people were so heavy that there was no rent at all left, and proprietary right ceased except in the State. In such cases the proprietary-right might have been vested in our early Governments in the same way.

1123. There is no evidence that they ever altered the common law of India, is there, which gave to the people of India the proprietary right?—Some of the Mahomedan lawyers have, I believe, laid it down that the land belongs to the State.

1124. Sir C. Wingfield.] But the power that the State possesses to fix its own demand on the land, practically puts it within its power at any moment to destroy all property in land by taking all the rent?—Yes.

1125. And the possession of private property in India, therefore, depends on the moderation of Government?—Yes; to that extent.

1126. And the Mahomedan governments who took the entire rents did practically destroy private property?—Yes; and therefore it is possible that, in those parts of the country which have been for a long time under the Mahomedan government, the property in land had lapsed from the people to the State, because they took the rent and everything else.

1127. Chairman.] Is it not the case that, though the extortions of revenue by the Mahomedans were unlimited, yet they never interfered with the proprietary rights in the land, which remained as they were before, and had all the proprietary incidents of inheritance, of mortgage, and of dealings between man and man belonging to proprietors?—I should think it would be difficult now to state positively; but in certain places where the Mahomedans had established middlemen, and required these men to pay a large sum as revenue, the proprietary rights of the villagers were not properly regarded. The right to all the lands of the village was, perhaps, held by a certain number of families; but the renter of the Mahomedan government would not regard those rights at all, but would give the land to the man who would give him the largest revenue.

1128. Is there any evidence that the Mahomedans, by any act or declaration of theirs, ever destroyed the ordinary incidents of proprietary rights of the previous occupants?—There is no proclamation or anything of that kind to my knowledge.

1129. There is no record of any single State Act which repudiated the proprietary rights of the persons that they found occupying the land?—No.

1130. And, as a matter of fact, did not those proprietary rights go on uninterrupted, though subject to these extortions?—They would have gone on uninterrupted, if they had been worth maintaining.

1131. Did not the lands pass by inheritance, and were they not subject to all the incidents of proprietary rights as between man and man?—Yes.

1132. Subject to particular acts of extortion, and oppression, and violence?—Yes.

1133. In the same way they seized women, if they wished; but you would not say that humanity had been absolutely destroyed under the Mahomedan rule?—No; but in certain cases

proprietary right of land might have been destroyed by such extortions.

1134. Sir C. Wingfield.] The Mahomedan government never repudiated the principle of private property in land, but their exactions and their oppressions frequently had the effect of destroying private property in land, by taking the whole rental as revenue?—Yes.

1135. Chairman.] The Mahomedans constantly destroyed private rights of all kinds by their iniquitous extortions?—Yes.

1136. Mr. Grant Duff.] You expect a steady increase in the Madras revenue, do you not?—I have every reason to think that the land revenue will continue to progress.

1137. Will that increase be slow?—It will be slow; in fact, I do not suppose it can be expected to be so rapid as it has been during the past 15 years.

1138. Have you any reason to expect that the cost of collection will diminish in Madras?—The per-centage of the cost of collection will diminish, no doubt, as the revenue increases; it has, in fact, diminished this very year; it has gone down to 9 per cent. in consequence of a larger revenue than that of the previous year having been collected at the same cost.

1139. Sir C. Wingfield.] In the southern part of Madras you found the proprietary communities existing in a very perfect state?—In Tanjore, which had not been under the Mahomedans at all, they existed in a complete form.

1140. In fact, they were identical with the constitution of the village communities in Upper India?—I believe so.

1141. And they prevailed, in a more or less perfect state, in proportion as the different portions of the provinces had been for a longer or a shorter period under Mahomedan rule?—That has always been my view.

1142. Chairman.] Is there any portion in the Madras Presidency that is at all abnormal in its condition at the present time, that is to say, in which the lands are not under ordinary settlements in any way?—Some portions of the unoccupied land have never been settled.

1143. I mean districts occupied by particular tribes, or under particular conditions?—No, there are no parts of the country of that character. The districts of the Western coast are in a different position from those of the rest of the Presidency, no doubt because the people there live as separate proprietors in farms, and not in village communities at all. In Malabar the people are a different class altogether from those of the east and south; you have an upper class of land-owners, and a class of work-people and cultivators under them.

1144. The limits of their property are all marked by the estate, and not by the village?—Yes.

1145. Sir C. Wingfield.] In Malabar and Zanara the people live in detached houses and homesteads, like the little proprietors in France?—Yes.

1146. In the early part of this century, I think about the year 1812, it was resolved after the permanent settlement was discontinued, to make a village settlement in Madras?—In certain parts of Madras village leases were tried for a few years.

1147. That system broke down?—Yes.

1148. Then the opinions of Sir Thomas Munro became prevalent, and it was resolved to carry out the system he had introduced into the ceded and

and conquered provinces, which you have called the ryotwaree system?—Yes.

1149. Sir Thomas Munro has been represented as having denied private property in land; but that is simply because in those ceded and conquered provinces that had been longest under the rule of the Mahomedans private property had been seriously impaired?—Yes; that may be so, but his ryotwary settlements certainly did not deny private property in land.

1150. He settled the occupant, but he denied the hereditary right of property?—Yes, he did not go far enough back, perhaps, in all cases, but he viewed the person he settled with as the proprietor.

1151. But he explains that himself, by saying that it was incompatible with the rapacious demands of the State, which is just what we were saying?—He may have done so.

1152. That system which was adopted after the failure of the village settlement, has remained in force to this day in Madras, that is to say, dealing with the individual occupant?—Yes.

1153. Whether he were previously the proprietor of the land or the tenant of the land?—That was not inquired into at the time; the man found in occupation was as a rule dealt with as the owner.

1154. In those days there was too much land for the men, and not too many occupants for the land, and the State was very glad to get any man who would engage for the vacant land?—Yes.

1155. The only difference between that system in Madras and the system in Bombay, as I understand, is not in regard to the people that you deal with, but you have not carried out that elaborate system of survey that they have?—Our revenue survey is a very elaborate one.

1156. You have only just begun it, have you not?—It has been in operation now for 15 years.

1157. It is very slow in its progress?—It is very slow in its progress in consequence of the minuteness of the details to which it goes.

1158. I understand that in the district settled in Madras, under the ryotwaree system, the State exercises no interference through its revenue officers between the man who engages with the Government for the revenue, and any person that he may sub-let the land to?—None whatever.

1159. But in the permanently settled estates you have passed a law to regulate the relations between the proprietor and the old cultivator?—To a certain extent, those relations are affected by a recent Act.

1160. When the permanent settlement was introduced into Madras you only copied the Bengal regulations; the early Madras Regulations were mere transcripts from the Bengal ones?—I believe so.

1161. And they left the question of the rights of those holding under the zemindars very vague indeed?—Yes.

1162. And a constant altercation went on, some functionaries leaning to the side of the cultivators, some to the side of the landlord, till ultimately, about six years ago, you passed a law settling the relations once for all between the proprietor, the zemindar, and the village occupants under him?—Yes.

1163. And that you consider to have been a fair compromise of contending claims?—Yes. If some proprietor's tenants have been given an absolute right of occupancy so long as they pay certain rates of rent, the proprietor himself has been given a specified interest in the waste and unoccupied lands of his estate, and neither party is any longer at the mercy of the official to whom it might fall to interpret the old conflicting laws on the subject.

1164. In using the term ryots, it is a very deceptive term, because it is applied in one part of India to designate a totally different class from another; you mean by a ryot every man who, under a ryotwaree settlement, engages with the State?—Yes; but a zemindar's tenant is also termed a ryot.

1165. That ryot may be a rich banker or may have 2,000 acres of land, or he may have only two acres of land?—Yes; I have a statement here of the numbers under each class. Of ryots paying upwards of 100 £. we had only 420 in 1861-62; they were reduced to 384 in 1866-67. Then, of ryots paying from 50 £. to 100 £., we had 1,627 in 1861-62, and they were reduced to 1,550 in 1866-67.

STATEMENT furnished by the Witness.

	Number in 1861-62.	Number in 1866-67.
1. Ryots holding single leases and paying 5 £. and under.	1,747,398	1,785,005
2. Ryots holding single leases and paying from 5 £. to 25 £.	108,939	112,075
3. Ryots holding single leases and paying over 25 £.	7,088	7,011
4. Ryots holding joint leases of various amounts.	262,009	360,784
TOTAL - - -	2,126,035	2,265,485

Mr. J. B. Smith.
Sir David Wedderburn.
Sir Charles Wingfield.

THE RIGHT HONOURABLE ACTON SMEE AYRTON, IN THE CHAIR.

Mr. JOHN HENRY MORRIS, called in; and Examined.

Mr. J. H.
Morris.
18 April
1871.

1166. *Chairman.*] WILL you be good enough to state what offices you have held in India?—I was Settlement Officer in the Punjab, Magistrate and Collector of Allahabad, Settlement Commissioner of the Central Provinces, and I am Chief Commissioner of the Central Provinces now.

1167. How many years altogether have you been in India?—Twenty-three years.

1168. Will you be good enough to state when the Central Provinces were established as a separate district?—They were placed under a Chief Commissioner in 1861.

1169. Previous to that time, what had been the condition of the territory forming the Central Provinces?—Previous to 1861, the Northern Province, called the Saugor and Nerbudda territories, was held under the North West Provinces. It had been originally ceded by the Mahrattas in 1818, and subsequently held under the North Western Provinces; and the Nagpore Province was held by the Mahrattas up to 1854, when on the death of the rajah it was annexed under the orders of Lord Dalhousie, and kept under a separate Commissioner till 1861, when they were all formed together into a Chief Commissionership.

1170. Previously to 1861 the Nagpore Provinces were under the direct administration of the Government of India?—Yes, and administered by a Commissioner.

1171. Those two districts combined constitute the whole of the Central Provinces?—With the exception of Sumbhulpore, which was annexed, I think, in 1862, from Bengal (it was formerly under Bengal) and the district of Nimar was held separately under the Government of India, under a political officer.

1172. When was that acquired?—I am not sure of the date, but I think it was acquired subsequently to the Saugor and Nerbudda territories.

1173. Will you be good enough to state what arrangements have been made with regard to the several districts of the Central Provinces, for the purpose of assessing the land revenue, taking them in any convenient order that you please?—

Will it be sufficient if I commence from the formation of the Central Provinces, or should I go back to the North West Provinces?

1174. Will you tell us as much as is necessary to enable us to understand what was the state of things before you made your settlement?—When the Saugor-Nerbudda territories were acquired by the North West Provinces, short term settlements were made on what were called farming leases, varying from three to five years, and ultimately a 20 years' settlement was made.

1175. Were those farming leases made with an individual for the village, or with the village in gross?—They were made with the individual. Formerly, under the Mahrattas, the villages were farmed out, sometimes to the old proprietors, or persons who had founded the villages, and sometimes to the men who were best able to pay the revenue; and on our acquiring them these farmers, or holders, received a lease of the whole village from the Government, and it was considered a farming lease; the proprietary right being declared to vest in Government, and not in the farmer; the farmer was considered only the lessee of the revenue to Government.

1176. Were the cultivators and occupants of the lands within the village regarded as owners, or in what way were they regarded?—They were considered as the tenants of the lessee; but their status depended a good deal on what their condition had been formerly. If the cultivators had been very strong formerly, then they were almost in the condition of proprietors; but if the farmer had founded, or long held the village, and had settled the cultivators in it, and regularly realised rent from them, then the position of the occupants was little better than that of tenants, whilst the farmer might be regarded as the landlord; but he nominally was only the Government lessee, and he contracted for the Government revenue for a certain number of years, and made his collections from the actual occupiers.

1177. Did the Government prescribe any rules between the lessee and the occupant, or did they not interfere between them?—At first they did not interfere at all.

1178. When

1178. When did they begin to interfere between the lessee and the occupant?—A 20 years' settlement was made in 1834, or 1836, and during the period of that settlement the North West Government began to make inquiries on grievances being brought forward by the cultivators, or tenants, and certain rules were laid down by the North West Board of Revenue to be followed in investigating these complaints, but nothing really effectual was done until the re-settlement of the Provinces, which came on in 1856.

1179. What was done then?—Then a code of rules was drawn up by the North West Government, stating the principles on which the settlement was to be made.

1180. Will you state, shortly, the purport of those rules?—This is merely with reference to the Saugor-Nerbudda territories. The first rule laid down was, that the Government would no longer be regarded as the proprietor; that any right that was considered to vest in Government was given up, and the proprietary right was to be conferred on those who could prove the best title. If the lesser, the person who had the lease from Government, could prove an old hereditary title, that his ancestors had founded the estate, or that he had received it in very bad order and had re-established it, or had caused much land to be brought under cultivation in it, or had spent large sums of money in its improvement, and had exercised considerable power over the tenants, then he was declared the absolute proprietor of the village; if he could not prove that, but still could prove that he had done a good deal for the village, and if, concomitantly with him, there were occupants who had held as long as he had held, and who had not been much interfered with by him, and who had improved their land and spent money in its improvement, and had held a position generally superior to that of ordinary cultivators, then these occupiers were declared proprietors of their several holdings; and the rest of the village, that is to say, the land held by tenants-at-will, and the uncultivated portion, was made over to the lessee, provided, as I said before, that he could prove that he had done something for the village; that he had brought it into order, and so on. But if he could not prove an old hereditary title, or that he had done much for the village, and if there were a number of cultivators in the village who had held before he got the village, or had held in a measure independently of him, or had done much for the village, or if it could be proved that the lessee had given up the village for arrears of revenue, then he was not considered to have a title to the proprietary right, but each of these cultivators was declared proprietor of his holding, and the rest of the land held by tenants-at-will, and the common land of the village, was made over to the whole of these old cultivators, who were formed into a village community.

1181. That being the state of things, were you employed to make a further settlement?—Those were the orders laid down by the North West Government; these orders were in a measure carried out up to 1857, and the measurements also were being carried on when the mutiny broke out; but not very much was done until 1861, when the provinces were formed into a chief commissionership. Then the matter was regularly taken up, and these cases were gone
0.59.

into by the settlement officers, the cases were decided and rights conferred.

1182. On the creation of the Central Provinces no new orders were issued?—No; simply these orders were all collected together, and published in the form of a settlement code, and we were directed to carry them out.

1183. Can you state what has been done towards the carrying out of this new settlement; has it been entirely completed in the Saugor-Nerbudda territories?—Yes; entirely completed.

1184. What has been the effect of that upon the disposition of the land; have you divested the Government of all proprietary right and possession now in those provinces?—Yes, almost entirely; there are few states remaining in which proprietary rights vest in Government, from there being no one who is considered entitled to the right.

1185. Have you, under that system, dealt with all the unoccupied land in the Saugor-Nerbudda territories?—Yes, under that rule and under another rule, by which orders were laid down by the Chief Commissioner declaring that as a general rule the whole of the waste land which had formerly been considered as nominally attached to a village was not to be given over in proprietary right to those people; that unless they could prove more than a nominal possession of these waste lands, they were to receive only as much waste land as was considered sufficient to enable them to carry on the village; a maximum being fixed of 200 per cent. of the cultivation, and all the rest was considered as waste land belonging to Government, which the Government reserves to itself, and grants out, and sells under the waste-land rules, and brings it under charge. All that is so much land to the good when Government likes to dispose of it.

1186. Can you tell us approximately how much land of that character remains available to be granted out as waste land?—There are now Government waste lands to the amount of about 15,000 square miles in the Central Provinces; I cannot tell you the amount in the Saugor-Nerbudda territories separately.

1187. A large portion of that is in the Saugor-Nerbudda territories, is it not?—A considerable portion; I should say that from about one-fifth to one-sixth of the total area is Government waste, and five-sixths is cultivated land, and land held by the proprietors of the cultivated land.

1188. Can you state to the Committee what has been the effect of this last re-settlement on the land revenue; has it increased or diminished the land revenue?—Without referring to figures I could not tell you how much it has increased in the Saugor-Nerbudda territory; certainly it has increased it, and for the whole of the Central Provinces it has increased it about 12 per cent., but the increase in the Saugor-Nerbudda territories has been chiefly confined to four districts. Two districts, Saugur and Damoh, were notoriously over-assessed under the former settlement, and entirely broke down, and the people left the country, and there was much distress, and a considerable reduction had to be granted in those districts, so that the large enhancement which was imposed on two or three of the richest districts in the province has been brought down very much by the reduction which had to be granted in those other districts.

II 4 +

1189. For

Mr. J. H.
Morris.

18 April
1871.

Mr. J. H.
Morris.
18 April
1871.

1189. For what period has the re-settlement been made; is it in perpetuity?—No, for the greater portion of the Saugur-Nurbudda territory, it is for 30 years.

1190. Is that a fixed settlement for all the five-sixths in the hands of occupants and proprietors, or is there any possibility of increase during the thirty years of that portion of the land revenue?—No possibility of increase, during the currency of the settlement, except from lapses of rent, free land.

1191. That would be a recognition rather of grants that were found to exist at the occupation of the country?—Yes; there are two kinds of grants; there are perpetuity grants which are mostly religious grants in favour of temples, and endowments, and the others are grants for services, and such things, life grants. The religious grants are mostly exempted from revenue in perpetuity; the service grants are only exempted for the life of the occupant, or sometimes for two lives.

1192. And were all these grants carefully examined?—At the settlement they were; that was one of the operations of the settlement, to go carefully into the rent-free tenures, and to decide which were to be released, and which were to be resumed.

1193. Can you state the amount of grants that were recognised for exemption for ten years?—The amount for the Central Provinces altogether released is about a twelfth of the revenue.

1194. Then those lands which have limited grants will come under charge, you think, altogether in about 25 years?—Yes.

1195. Then the only increase of land revenue that can arise in the Saugur-Nurbudda territories, will be from the taking up of the waste lands, and the lapse of the grants?—Yes; unless you include anything that might accrue from the management of the forests, which is also connected with that.

1196. Is that forest question a large one?—I mean that these waste lands are now held and managed by the district officers, and there is a considerable revenue which is already realised from them, about 30,000 *l.* a year; they were withdrawn from the village areas, and were considered as Government waste lands.

1197. Are grants made by the Government of the right of cutting timber in the forests?—Yes; part of them are excluded as Government forests; and as to the rest a considerable revenue is realised from letting out the land for grazing purposes, and also from annually leasing out the right to collect miscellaneous forest produce, which brings in altogether more than 30,000 *l.* a year; and we are introducing a new system which may, I think, result in a considerable increase of revenue from that source.

1198. What is the state of the Nimar district; is it in a different condition from the Saugur-Nurbudda districts?—The conditions are pretty much the same, but the former settlement was rather different; there was a 20 years' settlement made there, I think, about 10 years ago, and that settlement still has to run, so that the re-assessment of the Nimar district was not so complete as that of the Saugur-Nurbudda territories, and the question of the tenures was more gone into than the actual Government revenue re-assessed.

1199. Is it then to be re-assessed at a future period?—The Government have ordered that the

revenue, as now revised at the re-settlement, is to hold good until the expiration of the 20 years' settlement, which has been extended over part of the Nagpore Provinces. The 30 years does not extend over the whole of the Central Provinces; part is for 20 years.

1200. In other respects is the Nimar settlement just the same as the others?—Yes; the only difference was that the revision of the revenue was not so complete as in the others.

1201. Will you state what has been done with the Nagpore Province?—When we took the country from the Rajah in 1854, we found also a system of leases from Government existing there.

1202. What was called farming the revenue?—Yes; up to 1861 these leases were granted for short periods of three years.

1203. Were they granted separately for each village, or sometimes for many villages, in one farming lease?—Not unfrequently several villages were held by one man, but still there was a separate engagement for each village; I am talking of the ordinary tenures, because there were people who hold lumps of villages, but that was on a different tenure altogether.

1204. What was done by the Government of India on acquiring the province?—The Government of India determined that the same rules which had been applied to the Saugur-Nurbudda territories, were also to apply to the Nagpore Province; that is to say, the proprietary right was to be thoroughly gone into, and investigated, and conferred on whoever could prove the best title under the rules which I have mentioned; and some other general rules were given, but the leading principles were the same.

1205. What progress has been made in carrying out that settlement?—It has been entirely completed.

1206. How long ago was it completed?—With regard to the last district, I think Government have not yet sanctioned the settlement; it was reported just as I was leaving, about eight months ago.

1207. You have said that about the same proportion of land was recognised in that province as belonging to some person or other, as in the other province?—Yes, 200 per cent. on the cultivation was the maximum, and all over that to which the holder could not prove an hereditary title, or complete and continuous possession, was reserved as the Government waste.

1208. That has resulted in about one-sixth being reserved to the Government?—Yes.

1209. Are these Government reserves generally wooded land, or land capable of cultivation, or hill districts that cannot be cultivated?—I should say perhaps a seventh or eighth of it consists of large forests, which have been reserved specially under the forest rules, and are Government reserved forests now.

1210. And they form part of that 40,000 *l.* a year which you have mentioned?—Yes; that is, between 7,000 *l.* and 8,000 *l.* a year is realised from the reserved forests, and some 31,500 *l.* from the Gort wastes; and I should say that a good portion of the Gort waste consists of rich cultivable land.

1211. Then we may take it that there is a limit to any increase of revenue, except as this land comes under re-settlement?—Yes; no very large increase of revenue can be looked for until the next revision of settlement; though, as I said

said before, I hope to realise a considerable sum by the introduction of a new system of administering these Gort wastes.

1212. When will the re-settlement begin; about how many years hence?—It will commence about 1885, about 16 years hence. But there is one point which I should just explain. For a portion of the Nagpore Province Government decided, and also as to one or two districts of the Saugor-Nerbudda territories, that the settlement should only be for 20 years. It was considered that the province was in a transition state, and that the effect of the railways and other improvements could not be told just at present, and that a 30 years' settlement was too long; and it was therefore decided that all the districts not then settled, that is to say, four or five years ago, should be settled for 20 years instead of 30. About a fourth of the province is settled for 20 years only.

1213. A considerable portion of the land revenue will be re-assessed at the end of 15 years therefore?—Yes, about a fourth of it.

1214. Is there much property granted out in rent-free tenure in the Nagpore territories?—No, not more I think than in the other; it is about the same. I should say for the whole province it is about a twelfth.

1215. There will be no increase except by the re-settlement, or the bringing into cultivation and assessment of the waste lands?—And the lapse of these rent-free tenures which have been granted for life.

1216. Is there much disposition now to take up the waste lands in the Central Provinces?—There was at first rather a disposition; several large landholders came forward, and bought considerable portions; but the result has not been satisfactory.

1217. When you say "bought," what do you mean?—They bought it under the waste land rules. Government fixed a certain price, which was two and a half rupees an acre, for certain districts, and one and a half for other districts, which was considered the minimum. It was put up at that to auction, and if any one bid more than the man who wanted it, and he did not outbid them, they got it; if otherwise, he got it.

1218. What did they buy?—The proprietary right in the land.

1219. Free from taxation for ever?—Yes, that was the waste land rule, viz., that it should be free for ever from payment of any land tax.

1220. Mr. *Fawcett*.] They bought the freehold?—Yes, the positive freehold.

1221. *Chairman*.] People have freehold land in this country, but still they pay taxes for it?—Nor do I apprehend that the rule I refer to above would exempt them from any other than the land tax.

1222. Is there an express stipulation in the deeds that they shall never be subject to any taxation?—I think you will find in the rules promulgated by Sir Charles Wood that they were to be liable to no payment of any land revenue at all, or, in other words, that the land tax was redeemed in perpetuity; but I know of no stipulation that they shall never be subject to any taxation of any kind.

1223. Are those rules still in force?—I do not know that Government have actually rescinded them; for the Central Provinces I proposed to Government that they should be in abeyance, as I found that they were not working

0.59.

very satisfactorily, and they are in abeyance; no order had come from the Government when I left as to what should be done.

1224. Mr. *B. Denison*.] Do they pay road cess?—Yes, they pay road cess. But I am talking of the actual Government land revenue, as we know it in India; I am talking of the Government waste land rules for the whole of Northern India.

1225. *Chairman*.] Do you know whether those rules were made under an Act of the Legislative Council?—I could not say that.

1226. Was the question ever raised in India whether the Governor General possessed the power of doing anything of the kind?—No, I do not recollect hearing that discussed.

1227. I mean whether the Government in India, with or without the sanction of the Secretary of State, possessed the power of binding the Legislature not to levy a tax upon the land?—The rules that I am referring to were not rules of the Government of India, but orders of the Secretary of State; I do not recollect the subject having been discussed.

1228. Has much land been sold under those rules in the Central Provinces?—Yes, a considerable amount has been sold; luckily we have got some portion of it back again; the people failed to pay up their instalments, and we have got good large lumps back again; I remember some good large tracts, however, that have gone.

1229. What is the land assessment upon cultivable land generally in the Central Provinces?—The average rate for the whole of the Central Provinces, I think, is about 1s. an acre; but then that includes a great deal of very poor land; part of it is uphill country, worth little or nothing; and I should say, deducting land which is hardly more than nominally cultivated, that the average rate on fairly cultivated land in the Central Provinces would be from 1s. 6d. to 2s. an acre.

1230. Do you mean black soil land, when you speak of fairly cultivated land?—Yes; and such land as there is in the Central Provinces.

1231. When you speak of that assessment of land actually under cultivation, is it not the practice in the Central Provinces to exhaust the soil by repeated crops, and then to let the land lie fallow?—Yes, it is partly so; and it is the practice in the Central Provinces to exhaust it, and still go on cultivating it. In the Central Provinces, in what is known as the Nerbudda Valley, you see land that looks first rate, and yet it very seldom gives more than five or sixfold of the seed on an average.

1232. Repeatedly cropped without manuring?—Yes; and the black soil is not very favourable for irrigation, it is apt to clog and get muddy, and the seed rots in it.

1233. Then there is a considerable portion of the cultivated land lying fallow always?—There is a considerable portion of it; in my statement is included all fallow land in the cultivated area.

1234. Does the tenant pay his land revenue for the year, both on the land under actual crop, and on the fallow?—Yes.

1235. Sir *C. Wingfield*.] There is a heading in your statement, "Cultivation including fallow," is there not?—Yes. There are two kinds of fallow; there is the fallow that is merely thrown out in rotation, and there is land that is regularly thrown out of cultivation for a number of years. Much of the land in India is

1—

very

Mr. J. H.
Morris.

18 April
1871.

Mr. J. H.
Morris.
—
18 April
1871.

very poor, and will not bear crops for above two or three years, and then has to lie by altogether for several years. That would come under the heading of "Lately thrown out of Cultivation;" that would not be fallow land.

1236. *Chairman.*] Can you tell me what proportion the price of the land that was sold in the manner that you have stated, bore to the revenue, charged for one year upon similar land; how many years multiple it was?—In the rich districts, for instance, Hoshungabad and Nursingpore, through which the Great Indian Peninsula Railway runs, it is sold for very large sums; that has been sold, I should say, for from eight years up to 15 years' purchase, and even higher than that.

1237. It would seem also to have been sold lower?—In the hill districts, which is where the land is generally bought, because it is bought for pasturage purposes, it is not unfrequently sold at little above the minimum price fixed by Government at from 3s. to 5s. an acre.

1238. But what would have been the rate of assessment put upon that land, supposing it had been land in ordinary occupation at the time of the settlement?—With regard to the land which I am talking of, which fetched little more than the minimum price fixed by Government, I think you could hardly have put any assessment at all on that. The people already have more than they could cultivate, and it would be useless to them; they could do nothing with it, and there is no one there to take it up; so that Government would in reality, for a great number of years, until the provinces have a much denser population than now, have got nothing from the land.

1239. Except for forest or grazing purposes?—Yes, which Government now realises in the form of the forest revenue from that. What Government now realises in the form of forest revenue, I do not think would be on an average above 2d. or 3d. an acre.

1240. But what would be the motive for giving 3s. an acre for that land?—Because they got the proprietary right in it; then, too, they had a right of pasturing their cattle on it; many of them held large herds of cattle, and a good deal of that was purchased by Europeans who had an idea that the value of land would increase in the Central Provinces much more than it has done.

1241. It was for speculative purposes that they purchased it?—Yes; they have gone to out-of-the-way places and purchased land, and paid these small prices; but where land has lain in the midst of cultivated tracts, the villages have come forward and paid from 10 to 15 years' purchase for it, and higher still.

1242. But would they not in the same way have paid a land revenue equal to the interest of their money if they had been allowed to take it up at that rate?—Yes; they lost it because they could not prove a sufficiently good title to have it made over to them in proprietary right; but still, as it was near to their villages, and they wished to prevent other people from getting it, they were prepared to come forward and buy it at a good price.

1243. *Mr. Fawcett.*] The freehold of that has been bought?—Yes, all on the same principle.

1244. *Chairman.*] It amounts to this then, that the Government was selling the revenue of

the country at from eight to 15 years' purchase?—Yes.

1245. That, however, is not going on now, I understand?—I cannot be certain whether the Government have rescinded the rules; but I proposed myself, in the Central Provinces, that they should be in abeyance, and they were in abeyance when I left.

1246. Are there any outlying districts in the Central Provinces which do not come within the ordinary territories, and which are specially administered; for instance, wild districts?—Yes, there are 15 feudatoryships, we may call them; tracts held by semi-independent chiefs who have been given certain political powers, and who pay some nominal, and some a considerable amount of tribute to Government; but still nothing like what would be the Government revenue.

1247. You do not go behind those chiefs, but they manage their territories themselves?—They manage their territories; they have certain criminal and civil powers given them; they can imprison, and they can even pass sentence of death, subject to the confirmation of the Chief Commissioner; but their revenue power is unlimited, and we do not interfere with it so long as they pay their tribute, and no great complaint is made against them. If they are complained against, an inquiry is made, and they are warned not to offend again.

1248. Is there any considerable extent of mineral property supposed to exist under the surface, in the Central Provinces?—There is a considerable amount of coal in various portions of the province.

1249. Does the Government claim for itself all the minerals?—Yes; the Government has reserved to itself all the minerals; and it is an express stipulation in these waste land rules, and one that is thoroughly understood, that the proprietary right conferred in these waste lands does not confer a right to the minerals.

1250. In regard to the general settlement of the country, is it considered that the Government reserves to itself all rights in minerals?—Yes.

1251. Is it at present deriving any revenue from mineral rights?—There is very little at present, but I think there is likely to be a considerable revenue from the coal discoveries in the Chanda district, and various other districts. I think the future of the country with reference to minerals is very promising indeed.

1252. With regard to the townlands, are all those settled on the same principle as the agricultural lands, or does the Government make any special assessment for land occupied by houses in towns and villages?—Government has not made any special assessment, and in the Central Provinces the proprietors who hold the lease of the land in which the town is situated are not generally in the habit of realising any ground rent; but in other parts of India, in the North West Provinces, they do so; but at the same time the Government realises from non-agriculturalists a kind of house tax, a kind of trade tax, which might perhaps be considered a recognition of the Government right. Still it is not at all a form of land revenue; it is a local tax, peculiar to the Central Provinces, called "Pandhari," not a land tax in any way.

1253. That is a kind of license tax?—Yes.

1254. That is not assessed on the value of the house,

house, but on the status of the trade?—That is so; but they look on it as a kind of house tax on non-agriculturalists.

1257. There is no land revenue on sites of houses or outilages?—All gardens, and so on, are assessed, and that comes under the land revenue; all land cultivated is assessed; but waste land and land on which buildings are, is not assessed.

1258. *Sir C. Wingfield.* You recollect, no doubt, that by Lord Canning's rules about the sale of waste lands, the lands were sold at a fixed price per acre?—I thought that the minimum was fixed.

1259. Lord Canning allowed the land to be sold to anyone who chose to buy it at a fixed price per acre; but before those rules had been long in operation, Sir Charles Wood rescinded them, and ordered it to be sold by auction; but as to the waste land that you speak of as having been sold, was that sold by auction?—Yes, all by auction. Lord Canning's rules were never applied to the Central Provinces, so far as I know; they were rescinded long before I went there. For the Central Provinces the same rate was fixed, namely, 5s. an acre; but it was considered that the Hill districts were so poor that they never would realise the 5s.; and in those days the permanent settlement was looked on with favour, and therefore the price was reduced from 5s. to 3s. for certain districts.

1258. You consider the assessment in the Central Provinces light?—I do not consider it too light at all; and I think I am prepared to show that it is not too light, because, although the rate may be very light, still the enhancement has been something enormous. In many estates in the Central Provinces we have doubled and trebled the revenue; but the reason why the rate continues so low, and the enhancement over the whole province does not exceed 12½ per cent. is, that the whole of the Central Provinces formerly were not lightly assessed, portions of them, the Saugor and Dumoh districts, were very much over-assessed; other districts were highly assessed, and only certain portions were lightly assessed. My experience is that you cannot double, or treble, or quadruple a man's taxation all at once; that if a man has been accustomed to live on a certain income for a certain number of years, you cannot halve that all at once; his marriage expenses and so on are regulated according to his income, and although he may be a man who ought not to be receiving more than a certain income a year, and may be getting double what his neighbour does, you cannot go and reduce him at once a half, and bring him down to his neighbour, or you bring him to ruin; and therefore the result was, that although we imposed a very large enhancement in particular cases, we were not able to bring the average beyond the point which I have stated. But there is not the slightest doubt, I think, that in the next settlement there will be a very large enhancement of the revenue in the Central Provinces. Another reason is this: that when the settlement was made, the effect of opening up railways and other communications in the Central Provinces was not known and felt, it was uncertain what the effect of opening them up would be on prices; and even now I am not certain that the prices in the Central Provinces can be considered as permanent at all; the railways affect only certain districts through which

they pass, or near which they pass, and eventually districts much further off will send their grain to the railway. Therefore I think that we are justified in not reckoning on the continuance of the high prices which we now realise.

1259. But I mean that, comparing the assessment as it falls on the cultivated land in the Central Provinces with the rate per acre in the North Western Provinces and Oude, it appears light?—It is very light, looking at it in that way, I am quite willing to admit; but then, first of all, at least half or two-thirds of the land in the Central Provinces is very poor indeed, the cultivation being next to nominal; and as to a great portion of what looks very good, our settlement officers went carefully into the question, and found that it did not realise in an ordinary year more than five or sixfold; you cannot realise a high revenue from that.

1260. *Chairman.* That arises from the want of proper cultivation, does it not?—Yes; our cultivators in the Central Provinces cannot be compared with those of Oude or the North West Provinces.

1261. Can you tell the Committee what is the yield of the soil which now produces sixfold, when it is really well cultivated?—There is one of the settlement officer's reports, the Hoshungabad Settlement Report, which describes certain experiments, and shows that the yield went up to 25 and 30-fold; certainly I think the produce might be trebled, and quadrupled, if the land were properly manured, and so on.

1262. *Sir C. Wingfield.* But in many districts of the Central Provinces the population is very sparse is it not?—Yes; even in the very richest district of the Central Provinces, viz., Nagpore, the number of inhabitants to the square mile, taking large cities and everything into calculation, is only 172. Now, in the North Western Provinces you go up to 400 or 500 to a square mile; in the Mundla district it is 43 to the square mile.

1263. Is the railway completed from Jubbulpore to Nagpore?—No; there is no railway projected there.

1264. *Mr. Bourke.* As regards the rules that you have spoken of, under what rules did you carry out the settlement with which you have been connected?—For the Saugor and Nerbudda territories, under the rules promulgated by the North West Board of Revenue, and for the Nagpore Province, under the rules promulgated by the Government of India, which were in a great measure confirmatory of those of the North West. They were the North West rules made applicable to the Nagpore Province.

1265. Were those rules framed by the Government of India, or were they framed by the Government at home?—They were framed by the Government of India as far as I know; they probably were reported to the Court of Directors; but I really cannot say.

1266. Now, under the Mahrattas the individuals had no proprietary rights in the land at all, had they?—Well, it is the fashion to say that they had no proprietary right. My idea is that they had nearly as strong a right under the Mahrattas as any other form of native government. The Mahrattas, as rulers, looked very closely after the administration of the revenue, and consequently under them the rights of landholders and all other occupiers of land may have been

Mr. J. H. Morris.

18 April 1871

Mr. J. H.
Morris.

18 April
1871.

been very much over-ridden; but still I consider that the right did exist in some form or another.

1267. Then it is not correct to say that the Government of India, under the old rules, always had the proprietary right?—No; nominally the proprietary right vested in Government, and all the Government did was to say, the right shall no longer vest in us nominally; we will give it over to those to whom it really belongs, and who we think have the best title.

1268. Are the proprietary rights in the waste lands sold in the same way as of the other lands which have been settled?—Yes; proprietary right and everything is sold just in the same way, including the revenue right, as regards the Government demand.

1269. Has the produce of the countries through which the railways run very much increased in price since the railways have been made?—Very much in the Nerbudda Valley. But I think, as I was saying just now, that the great rise in price cannot be considered permanent. I think that as the country further off comes under the influence of the railway, more grain will come to the railways, and the price will be lowered at the railway itself; still there is a very great increase.

1270. Has the question ever been raised of taxing these districts locally, in consequence of the rise in the price of produce in the district through which the railway passes?—It has not been raised exactly in that form: but I submitted a proposal for a railway to a very out of the way part of the country in the Central Provinces about a year ago, and in making that proposal I suggested to the Government that the guaranteed interest should be provided for by a local tax, to be imposed on the district which would be directly and immediately benefited by the construction of the railway.

1271. Supposing that was carried out; would that be looked upon at all as a breach of faith between the Government and the people with whom you have made the settlement?—I have heard it stated that it would be, but I do not think that it would be if you could show that these people directly benefited by the introduction of a railway which did not exist, and was not taken into calculation when the settlement was made with them.

1272. Was there any reservation made at the time of the general settlement at all as to immunity from other taxation, or special taxation, on the land?—Not that I know of; the reservation was, as regards the land revenue, that the land revenue should be paid for a certain number of years. I do not know what the people may understand, but there was no reservation that they should not be taxed in a way which could be considered as not land revenue. For instance, we in the Central Provinces get two per cent. road cess instead of one, as at the former settlement, and we get two per cent. educational cess instead of one; and I think in exactly the same way, if you could prove that there was any direct and immediate benefit to these people from any work undertaken by Government, Government might fairly look to a return from them.

1273. You do not think that there would be anything unjust in imposing a tax for the purpose of paying the interest of a loan for such objects?—I do not think so; I proposed that this should be done with respect to that railway to which I have referred; I do not know what orders

Government have passed on it, but I proposed that in that instance that should be the way in which a portion of the interest should be paid till the railway paid for itself.

1274. Mr. B. Denison.] You have stated that if the cultivation improved in the Central Provinces in many parts, the produce of the land would be very largely increased; the land revenue settlement was, I presume, based upon the actual produce at the time the settlement was made?—It was based upon the actual produce, on what we considered the land capable of producing at the time the settlement was made.

1275. On what it actually did produce?—Yes.

1276. It was not made with reference to any probability of improvement by improved cultivation?—It was considered that to get improved cultivation you would have to spend a considerable amount of capital, and that the people were to get the benefit of that capital during the term of the settlement.

1277. The settlement was in fact made on the basis of the actual produce?—Yes.

1278. Would the enhancement of the produce arising from better cultivation more than represent the fair return on the capital necessary to produce that better cultivation?—Yes, and in certain parts of India the return would be large, and the original outlay repaid in the course of a few years. But in the Central Provinces it would be a slow process; because, in addition to the necessity of expending capital, the population is so very sparse that you would have to bring in more cultivators to do much good.

1279. Then your prospective increase of revenue on a re-settlement is to be looked for from what?—It is to be looked for more from rise in prices, and from extension of cultivation, I think, than from any very great or sudden increase in the produce of the land, except in one or two ways. I think if you could introduce large irrigation works, or anything of that kind, then you might look for a very large extension of the produce; but I think that as regards such extension as lies within the means of ordinary landholders, the expenditure of the capital to produce that would not be more than repaid by any extra produce during the term of a long term settlement.

1280. On a re-settlement when the present settlement expires, would it be fair to raise your assessment with reference to the then produce arising from good cultivation, and the outlay of capital?—Yes; because I think that what they would have obtained during these long term settlements would have repaid them.

1281. Then that shows that the return for this outlay is very much more than the mere interest on the capital?—It is more certainly. I thought you meant that the return during the term of the settlement would be very much more than the interest and capital (that is original outlay) combined.

1282. Do you consider it just towards the cultivator, when the re-settlement takes place, that you should raise your revenue, because he has improved the value of his land, by his labour, and by his capital?—If the increase in the produce is more than repays the value of his labour, and the value of his capital, then I think it is fair to impose a moderate enhancement.

1283. Then of course there is not any inducement for him to lay out capital when the Govern-

ment, is to have a share in the return?—But there would be an inducement if he could reap the entire benefit for 20, to 30 years without paying for it, which is the reason why we make a long term settlement, and on the expiration of the settlement, why a fair share in the return was claimed by Government.

1284. *Mr. Beach.*] You stated, I think, that the inferior land in the Central Provinces was generally very badly cultivated; is the more fertile portion of the land better cultivated generally?—It is better cultivated, but still the best cultivated land in the Central Provinces is poorly cultivated, as compared with good land in other parts of India.

1285. Do you find that in the case of longer leases, such as 30 years, it is better cultivated than under a 20 years' lease, for instance?—I do not think that the difference between a 20 and a 30 years' lease would be much in that respect; but I think that the people would be prepared to improve their land more under a long term settlement, such as 20 years, than under a five years' settlement. There is a system of irrigation in the Central Provinces by embanking their fields; it costs money to do this, and under the short term settlements they had not done it, but no sooner was the long term settlement made than a great many of them embanked their fields.

1286. Where the land revenue has been ceded altogether, do you find that that land is better cultivated?—Land of that kind, in the Central Provinces, has been too lately ceded, and is, generally speaking, such poor land that really, I think, there has been little or nothing done to it hitherto. It is only within the last few years that they have ever had it.

1287. Do you think that it would be proper for the Government to undertake works of irrigation?—Certainly, I think so; but I do not think that in the Central Provinces anything but a large and comprehensive work would be much good. There is a work proposed, but the last estimate brings it up to above a million, and that is the only work that I can see likely to repay the capital. That would give a return of about 7 per cent. I do not think that others of a smaller character would repay more than 3 or 4 per cent.

1288. You stated that a road cess, and an educational cess, were paid; would an additional cess for works of irrigation be considered unjust?—No, certainly not; it would increase the produce of the land so much that, I think, they could pay it out of the increased productive power of the land. In fact, in this large scheme of ours, that is how we propose to repay the interest on the capital which the Government would advance, by an enhanced cess, under the name of a water rate, which would vary with the different crops grown on the land which was irrigated.

1289. Would that have a good influence also on the inferior portions of the soil?—Yes; very often it would not do so much for the rich portions of the soil as for the inferior; much of the inferior would, with water applied to it, give a good crop, which now gives next to nothing.

1290. It is not from the intrinsic nature of the soil, but from the want of water that it is poor?—Yes, in some cases; in others it is from the intrinsic nature of the soil.

1291. *Sir J. Elphinstone.*] With regard to

the land lying fallow (by that I mean dry land), has there been any means taken by Government to ascertain what is the best process of bringing it into a state of fertility, and a proper rotation of crops?—Experiments have been made by Government officers, but I do not know that there has been any scheme by Government at all for doing much at present, except that we have been trying, in the Central Provinces, a small scheme, which I introduced with the sanction of Government, for trying to increase the productive power of the land, with reference to the growth of cotton. We have been introducing there a small irrigation scheme to try the effect of irrigation and manure combined, with regard to cotton. Hitherto we had found that the two had not been employed together sufficiently, and the combined effect had not been thoroughly tried; and I got up a small project before I left India to try this scheme to which I allude; but I am sorry to say that it has been reported to me, that the floods were so great this year that they washed away a part of the embankment, and the scheme in consequence partly failed. The Cotton Commissioner and his assistants do also something in that way.

1292. There is no department of analytic chemistry to ascertain the nature of the soils, and the manure required to bring them into a good state of production?—No. In the Bombay Presidency there is a department which ascertains the quality of the soil at the time of the settlement.

1293. It does not extend to an analytic department?—No.

1294. I speak from my own knowledge of Ceylon, where all the soils have been analysed with the greatest effect; you are aware also that there are certain model farms in Kandiah, and near Madras; are you of opinion that those model farms are a benefit to the country?—Yes, a great benefit; I do not think we can look to any immediate result; I think it will take a long time before we can get these people to take up our improvements, or even to think that they are improvements.

1295. But admitting that they will not take them up so rapidly, probably, as they would in this country, is it not a matter of very great importance that in each district, or in many districts, there should be established a model farm, not for the purpose of cultivating exotic productions, but for the improved cultivation of the native productions?—Yes, certainly; at the same time I think that a model farm introduced into each district would cost a great deal of money, and the effect would not be immediate, so that the outlay would be considerable at first, without any ostensible return to show for it.

1296. Are you aware that the result of the model farm at Madras has been to establish in many places the cultivation of the gram, as a green crop, with the greatest possible advantage?—Yes.

1297. And also that a simple multiplying wheel which has been established there, has been adopted in very many cases in the Madras Presidency, which raises the water tenfold more than the ordinary wheel?—Yes, I have heard of that; and there is no doubt that ultimately the effects would be very great, and a great material benefit would result; but I think it would be a work of time, and I think that the attention of the Government and the Government officers should

Mr. J. H. Morris.

18 April
1871.

Mr. J. H.
 Marria.
 —
 18 April
 1871.

should be towards improving what we find in use amongst the people, the natural products of the country, and not towards introducing exotics; that is what leads people away; they say, we want something that will be of real use to us; for instance, show us a mode of cultivation which, instead of five-fold of wheat, will bring us ten-fold or fifteen-fold.

1298. I refer to the introduction of Carolina rice, and different sorts of Indian corn; I gather from your remarks that you approve of those efforts for improved cultivation?—Yes.

1299. In the course of an irrigation work, or a road, or a railroad, which you proposed to carry into a distant part of the country, would it be possible for the collector or the leading man in the country to come to a local negotiation with the people, by which they would bind themselves to find the interest of the money, or to repay the capital within a certain number of years, at a certain rate; do you think that that could be done by private negotiation in the different districts?—Something might certainly be done, and it would be most desirable to lead the people along with one in matters of this kind. I do not know how it might be in more intelligent parts of India; I do not think that in the Central Provinces anything that the collectors might do in regard to the realisation of money from them would be looked upon as anything else than a Government order. Even in the more intelligent parts of India I think it would not be easy to get people to agree to it by any mutual arrangement. At the same time I think the Government could easily convince them that they were bound to repay them when they brought them any material improvement.

1300. Prices have risen very much, have they not, since the mutiny?—Yes: in the Central Provinces it is not so much since the mutiny, as since communications have been more opened up, and the country has been more looked after; it is more since 1861 and 1862.

1301. But is there not a tendency all over the country; even in those parts where there is not a railway, to a rise in wages and in the price of commodities?—There is such a tendency, but I should hardly like to say that the effect of the railways and so on does not extend to them; it is difficult to say how far they do extend.

1302. I find, from a paper which I have here of the average cost of rations per man per month in the Presidency of Madras, that in some of the districts which are at a remote distance from railways, the increase has been the greatest?—Then probably there would be some local causes which will explain that circumstance.

1303. The average price of a soldier's rations at Masulipatam and Vizagapatam, which no railway touches, in 1857 was Rs. 8. 4. 8., and in 1869 it was Rs. 13. 11. 5.?—I think that in whatever part of the Central Provinces there has been a great rise in prices, I could generally explain the cause to be, either the opening out of communications, or something of that kind. With regard to Masulipatam, that is where the Godavery Delta irrigation scheme is; or the grain may be exported to other parts of the country where it was not before; but my local knowledge does not extend there.

1304. Mr. Fawcett.] You have alluded to the sale of waste lands which has gone on in the Central Provinces, and in other parts of India; in what way is the money that those sales realise

appropriated?—Under the orders of Sir Charles Wood, I think, it is funded.

1305. But in the accounts of every year that I have looked into, the sale of waste land is put down as a portion of the revenue; it is either expressly stated as one of the items, or it is put down amongst the miscellaneous receipts; are you quite certain that the proceeds of these sales have not been appropriated to revenue?—I cannot say. I only know the order of Government that the proceeds of the sales were to be funded, but whether that order has been carried out I cannot say.

1306. Do you know anything of the system affecting the land revenue system of India, known as the sale of the khas mehalas?—I think that the khas mehalas are the estates in which the proprietary rights have lapsed to Government through some cause or other, through arrears of revenue, or from various reasons, and the Government has become the proprietor of the land.

1307. Mr. B. Denison.] What does khas mehal mean?—I think it means simply an estate of which Government is the proprietor; and in the sale of these Government has sold it by auction to whoever would pay the highest price for it. I do not know whether this sale carries the permanent settlement with it, or only a settlement for a term of years.

1308. Mr. Fawcett.] There has been a very considerable sale of these khas mehalas, has there not?—I cannot say, as there are no khas mehalas in the Central Provinces. There have been a few estates in which the proprietary right was not considered to vest in any individual, because nobody could make good his title. There were also some cases in which the proprietor had become a rebel, and the right had been confiscated. These became Government estates and were put up to auction.

1309. According to your definition of these khas mehalas and waste lands, if the proceeds of these sales are put down to revenue, and not funded, you would say that it is an improper appropriation of money, would you not?—I should say it was, certainly; as to those Government waste lands sold under the rules of Sir Charles Wood, but I do not know that the khas mehalas are so sold.

1310. I understand you to define a khas mehal as being an estate of which the Government is proprietor; if they sell those estates, and appropriate the proceeds as revenue, are they not appropriating that as revenue which ought to be treated as capital?—There is the proprietary right in the land, which Government may hold in the same manner as any private individual, and there is the right to realise the revenue, which appertains only to the State. If the Government sells only its proprietary right, I think Government may do what it likes with the money; but if it sells the right to realise the revenue, I think that should be funded according to the rules.

1311. Mr. Grant Duff.] There are no khas mehalas, I think, in the Central Provinces?—No khas mehalas, under that name.

1312. Mr. Fawcett.] As far as I understand you, the same thing has taken place on a small scale in your provinces; the Government has sold the proprietary rights over certain estates?—Certainly it has sold its proprietary right in these waste lands, and also it sells its right to the revenue.

1313. It has not sold its proprietary right in any

any other lands except waste lands?—Yes, it has sold it in those cases where the proprietary rights have been confiscated and lapsed to Government.

1314. If it has sold that proprietary right, is not that property which may yield an annual income?—Yes; but it is not the property that the Government holds generally in the country.

1315. But is not the proprietary right in the soil a form of property from which the Government can obtain an annual income?—It is worth something, I suppose.

1316. If it were not worth something, why should anyone buy it?—Just so.

1317. If that is the case, ought not the proceeds of such a sale be devoted as capital, and not as income?—That is a question of general principle which it is for the Government to decide, I think, more than for me.

1318. I want to put it to you as a matter of finance; these proprietary rights, as far as I understand, are worth something; they yield an annual income; if they were not worth anything they could not be sold; they are sold, and when they are sold the Government loses that source of annual income?—The proprietary right is not generally the source of annual income to the Government; it does not take its revenue as proprietor of the land; it realises its revenue as the State.

1319. But I understood you to say that it derived its property from two sources, partly from the revenue, and partly from these rights which you describe as proprietary rights?—But these are rights which have only lapsed to Government, in certain rare instances, from certain causes; the proprietary right in the soil is a private right; these rights lapsed to Government through some reason or other, but that is different from the State right to the revenue.

1320. Still if these private rights which have lapsed had not been sold, they would have been a source of annual income?—They would have been no more a source of annual income to Government than rights in houses, or any other private property, of which Government might become possessed. I do not see that it makes any great difference as regards the mode in which they have been disposed of by Government, provided they were merely private rights.

1321. But the Government, instead of selling these proprietary rights, could have let them?—Yes, the Government, as the proprietor, is entitled to the rent, and therefore, as landlord, must have let them.

1322. They have sold this rent, and they have not capitalised it, but have devoted it to income?—I cannot say whether they have; but, if I understand the waste land rules rightly, it was the revenue that was to be capitalised, not the rent.

1323. If they have done so, you having been concerned in the finance of India, do not you think that would really be using capital as income?—I do not see that it would be using it so any more than if they were selling any other private right that Government might be in possession of. In these very rights in the waste land, Government sells the proprietary right, and also the right to collect the revenue, and it binds itself never to impose any revenue on this land. In the case of estates which have lapsed to

Government, Government merely sells the proprietary right, and does not bind itself in any way not to realise any revenue; it realises the revenue all the same as the State. And my idea is, that where the Government sells its right to realise revenue, then that is funded under Sir Charles Wood's rules; but where it merely sells the proprietary right and still reserves the right to take the revenue, that is differently treated.

1324. You stated that the assessment was light in the Central Provinces as compared with Oude; are we to understand from that that it is not light so far as the cultivators are concerned; that it is not lighter in the Central Provinces as compared with Oude, considering the character of the soil?—The soil is poor and not so richly cultivated, and consequently the produce is less, and therefore the assessment is less, but I think that the cultivators in the Central Provinces are no better off than the cultivators in Oude; relatively to the cultivators, I do not think that the assessment is any lighter in the Central Provinces.

1325. I am right in concluding from your evidence, am I not, that under the settlement, until there is another settlement, the revenue will not considerably increase?—It will not considerably increase till the present settlement lapses, that is from 15 to 25 years hence.

1326. And at that time the increase which you suppose will take place, will be due to a great extent to an increase of prices?—Greatly due to an increase of prices, but still I hope there will be to a very considerable extent an increase of cultivation; and I think if the improvements are carried out there will be an increase in produce.

1327. But so far as it depends on the increase of prices, the Government is not better off, is it, because the expenses of Government increase at the same time?—I do not think that the expenses of Government increase in anything like a proportion to the rise of prices; they have not hitherto done so.

1328. They have increased very considerably, have they not?—They have increased very considerably, but nothing in proportion to the rise of prices.

1329. The general expenses of the Government have increased from 30 to 40 per cent., have they not?—They have increased considerably, but it is more from the introduction of general improvements, and so on, than from raising the salaries or anything of that kind; it is more generally than specially that they have increased.

1330. In reply to an honourable Member you said that if there were a new settlement, the Government would base that settlement not only on the prices of the produce then raised, but also upon the state in which the land was at the actual time, whether it was made productive through the skill and capital of the cultivator or not?—In a measure it would; of course it would depend on the judgment of the settlement officer, if he thought that the productive power of the land had been increased by capital expended by the proprietor, which had not been fully repaid to him, then the settlement officer would make all due allowance for that.

1331. If that is the case, will it not be a great inducement to the cultivator to let the land fall back during the last two or three years?—They do do that, and we provide against that. The annual village papers, which are given in

Mr. J. H. Morris.

18 April 1871.

Mr. J. H.
Morris.

18 April
1871.

year by year for the whole term of the settlement, show us pretty much what the village has yielded every year, and it is more on those returns that the re-assessment would be made than on the returns of the last year or two.

1332. Is not the increase of prices, which you have alluded to, partly due not only to the increased means of communication, but also to the immense importation of silver?—I should say it would be difficult to state what the importation of silver has been.

1333. You have not considered that?—I have not considered it sufficiently to give an opinion.

1334. There is a considerable amount of surplus agricultural produce in the Central Provinces with which you are acquainted, which is exported, is there not?—Yes.

1335. What does that consist of?—Wheat, rice, cotton, and millet.

1336. Staple articles of food?—Yes.

1337. What do the people receive in exchange for those useful commodities which they export; are they paid for in silver, or do they receive other useful commodities?—They are paid partly in silver and partly in other commodities.

1338. What other commodities?—There is a very large trade in piece goods and hardware; a considerable amount of salt is imported into the country, and some sugar. Those are the chief articles of trade.

1339. Could you form any estimate of how much of the exports which are sent out of the Central Provinces are paid for by silver?—No, I could not.

1340. You have stated that the irrigation works which you propose would not be highly remunerative to the Government, according to the estimate?—With the exception of one, a very large one, which has lately been submitted to Government, that will yield an estimated return of $7\frac{1}{2}$ per cent. on a capital of above a million.

1341. What is the name of that?—It is called the Kanhan project.

1342. The interest on that expenditure would be obtained by the irrigation cess?—Yes, by the increased produce of the land, and the water rate paid, the Government would be entitled to a certain share of the extra amount produced.

1343. From your experience are these estimates generally to be relied on?—This may be, I think, for we have done our best to keep it as low as possible; the officer who estimated it for me is a very experienced officer, and was careful to go much lower than anybody had ever gone before, so that I really think if Government are prepared to spend such an amount on the scheme, it is likely to pay. It is a reservoir formed about 20 miles above Nagpore, and the canal will extend through the valleys of the Wurdah and the Weingunga.

1344. Mr. J. B. Smith.] Your assessment was begun about how many years ago?—With the exception of Nimar the assessment commenced in 1863, about eight years ago, that is the 30 years' settlement.

1345. We will suppose that at the end of 20 years, from the commencement of the assessment, the land in a certain portion which we have just come to, is very much increased in value in consequence of roads and irrigation; in what manner would that be assessed; would it be assessed on the same principle as it was at the

beginning?—It would be assessed on the same principle, but the amount would be very much larger, because the amount of produce would be so much larger. The principle that we go on is that the Government is entitled to half the net profit, so that the object of the settlement officer is to find out what the rent of a certain tract of country is, and then having ascertained that, he takes half of the net profit. It would be assessed at a higher rate, according to the increased productive power of the land.

1346. Are there improvements making, and railways making through the lands, or in the neighbourhood of the lands that have been sold, as you state, not liable to taxes, or on the understanding that no taxes shall be paid?—I say not liable to the land revenue.

1347. Even if the value of the produce on those lands has been very much increased in consequence of such improvements, the Government has no right to make any charge?—Not any charge in the form of land revenue; they preclude themselves from doing it by selling the freehold right.

1348. Do you think that under the engagement with the Government, the Government could make a local charge upon them for roads?—Yes; I think they could, provided there was a direct and immediate benefit conferred. If you could prove that there was a road made through their country by which they directly benefited; for instance if there was a tract of country which was previously entirely locked up, and Government made a road by which they could get rid of their surplus crops, they would be able to make them pay for that.

1349. You are aware that that right of Government is denied in Bengal?—I am.

1350. Why do you think it will be acceded to in the Central Provinces?—There might be objections, but I think it is just, and that the people could be persuaded what it was that the Government had given up.

1351. If it would be just in the one case, would it not be just in the other?—Yes, and I see no reason why they should not, in Bengal, pay a road cess as much as any other part of India.

1352. Have any rates been made on those lands of which the Government have sold the proprietary right in the Central Provinces?—They pay the road cess in addition.

1353. But has it been levied in any case?—The road cess is not levied only where the amount of the land is very small; but where the amount of the land is such that the computed value would be of a certain amount of money, it is paid as road cess.

1354. But is it paid on that land?—Yes, it is exactly the same as rent-free tenures; they do not pay the Government revenue, but they pay the road cess and the education cess, and in the same way with regard to the feudatories, they pay the road cess.

1355. Did I rightly understand you to say, that sales of that character are still made by the Government?—They were made until last year; but last year I wrote to the Government, and suggested that the rules should be in abeyance, and they were in abeyance when I left; but the order of the Government had not been received when I left, and I cannot say what has been done since.

1356. Mr. Lyttelton.] We have not heard anything

anything of the method of collection in the Central Provinces; is it similar to the rest of India?—Similar to that in the Punjab and the North West Provinces; the landlords pay the revenue into the nearest Government treasury; they collect their rents from their cultivators, and pay it in in a lump sum.

1357. The settlement is invariably with the landlord?—Yes, ours is a landlord or village settlement, as contradistinguished from the occupiers' or field settlement of Bombay and Madras.

1358. It is not made with village communities?—Where the village communities are considered the proprietors, it is made with them; but they have a representative who pays it into the Government treasury.

1359. Can you tell us what the expense of collection is relatively to the total amount received?—The gross receipts for the last year given were 591,490*l.*, and the charges of collection 71,530*l.*, for the whole of the Central Provinces.

1360. Is it your opinion that the charges of collection cannot be diminished?—I do not think they could be much; they are not high at all.

1361. Mr. Beckett Denison.] Revenue survey and settlement charges are given as 26,000*l.*, making a total of 97,000*l.*?—The settlement for 1869–70 was hardly anything. The professional survey is separate, but that is merely temporary, it would only last two or three years more at most. When I speak of cost of collection there is half of the revenue officers' salaries and so on debited to that.

1362. Mr. Lyttelton.] How are arrears of revenue recovered in the Central Provinces?—They are recovered first of all by processes being served, and if they do not pay up then, by distraint of personal property; if that is not sufficient to realise it, by the imprisonment of the defaulter, and by the sale of the estate ultimately; but distraint of the personal property is generally found quite sufficient.

1363. Does that happen often?—Very seldom. the balances in the Central Provinces are very trifling, and vary from about a quarter to a third per cent. in the year.

1364. I suppose we may take that as showing conclusively that the settlement is very moderate?—Certainly.

1365. You do not find that the proprietors are so attached to their proprietary rights in the land, that they were willing to pay an extremely heavy tax for them?—No, they will not. Hitherto the proprietary right was considered to vest in Government, and perhaps many of them are apt to sell away their property without knowing what they are doing, and after two or three years they are very anxious to get it back again.

1366. Are transfers of land frequent then?—Not frequent by any means, but we have had two or three famines in the Central Provinces, and the very poor proprietors have sold their rights.

1367. There is no difficulty or expense attendant on the transfer of land?—No; very little; the realisation of the revenue is very easy indeed in the Central Provinces.

1368. Mr. Eastwick.] I think you said that Government were justified in imposing a cess for roads, and for education, on the cultivators after 0.59.

the settlement had been made for 20 or 30 years?—Yes; provided there was some direct and immediate benefit to them not shared in by the other districts.

1369. And who is to be the judge of that direct benefit?—The Government itself, and of course the people would be able to represent their views in the matter; they would represent them in conjunction with the Government officer, and if they could show that the benefit to them would not be so direct or immediate, as what it was supposed to be, their views would be listened to.

1370. But in the case of the cultivators representing that they did not derive any benefit from a road or railroad, and in fact declining to pay, what would be done; would they levy the money by distraint?—Yes; but to do that I think the Government would have to pass an act specially empowering the head of the Government, the Chief Commissioner, or the Lieutenant Governor, to realise a certain rate for such-and-such a purpose.

1371. But they would overrule the representation or the remonstrance?—Yes, if they thought it groundless, but not otherwise, and I think that in cases of that kind the people would be certain of justice at the hands of their own local officer.

1372. Have you ever heard of an instance of remonstrance against the cess?—No, because it is quite a new principle that we are attempting to introduce. I have myself been proposing it to Government for this Ryepore Railway.

1373. In the case of this great scheme, the Kanhan scheme, is it proposed to levy a cess there?—Yes; it is proposed to realise the canal revenue in the form of a water rate, which is assessed on the land which benefits from the water. An Act would be passed empowering the local government to realise such-and-such a rate; but then in a case of that kind, if the people refused to take the water, Government would not take the rate from them. It was proposed in India that they should be actually forced in the matter, and that if they did not take the water they should still have to pay; but I am hardly prepared to go that length.

1374. There have been difficulties of that character in Orissa, and some other places, have there not?—Yes; but I think that those who take the water would be seen to get such an enormous benefit that the others would only be too glad to take it.

1375. There are very extensive schemes for railroads, are there not, to connect Nagpore with Hingunghat and the Godavery, and also to run out in the direction of the Mahanuddy?—Yes; the one in the direction of Hingunghat and the Godavery is more for a mineral railway than otherwise.

1376. If these schemes were carried out they would much develop the resources of the country, would they not?—The Ryepore Railway would certainly. The Chanda Railway would do a great deal of good to cotton.

1377. In that case would you be able to raise a tribute from the feudatories at all?—I propose it in the case of the Ryepore Railway, because some of the feudatories would directly and immediately benefit.

1378. I do not think that you have stated on what principle the amount of tribute was resettled with the feudatories?—The tribute of each feudatory was settled separately, according

Mr. J. H.
Munnis.
—
18 April
1871.

to his past condition, and his status, and the terms on which he had hitherto held from Government.

1379. You could not at all say what percentage it was of his revenue?—No, it differed immensely. I have a table here which would show it in the case of each one.

1380. Will you mention one or two as examples?—There are 15 feudatories. There is Buxtar, he pays a twelfth of his supposed revenue; he lives in an exceedingly wild part of the country, and Government has interfered with him very little indeed; he is an old established feudatory, and the Government have satisfied themselves with a small tribute from him. Then there is Sonopore, he pays 500 L. out of a gross revenue of 1,800 L. So that you see it varies a great deal.

1381. In point of fact, it is a light tax upon them?—It is in many instances a mere quit-rent, and in almost all cases it is very much lighter than the land-tax. I laid down the principle to the settlement officers, which was that where it was not a merely nominal quit-rent, it should vary from a fourth to two-thirds of the Government revenue; if the Government revenue would have been 100 L., that the assessment on the individual would be from 25 L. to 75 L., according to his former status.

1382. Whereas we take half of the net profits from our own people, we take very much less in the case of the tributaries?—Yes.

1383. In point of fact are these feudatory estates better cultivated than those of our own people?—No. I should say in the Central Provinces, as a rule, they are not so well cultivated; they are very poor and backward; but that is as much arising from the nature and condition of the country as from anything else.

1384. What I wanted to get at is an argument to see whether, supposing a man was a freehold proprietor altogether, it would be likely that he would cultivate his estates very much better than one paying Government revenue; it goes a little in that direction, does it not, because if a man is very lightly assessed you would expect him to cultivate better than a man very heavily assessed?—I think so; but I think with regard to the native population in India, that they rather require the spur of a fair taxation very often to make them bring the land into fair cultivation, or they are apt to content themselves with just living.

1385. In the case of a proprietor of a village, who is the representative, is it the petale?—That is the Bombay term used for a man who is the Government collector of the revenue; the proprietary right in the Bombay Presidency, if I understand rightly, vests in the occupiers, and they have over them a person who realises the revenue, and pays it to Government. With us it is not so; the village community, or the holders of the land, are the proprietors, and if they like they can choose one amongst themselves to represent them, and this is sanctioned by the Government, and he is considered as the village representative. In many cases instead of being elected by the community, he holds the position hereditarily.

1386. Does he get any fee?—He generally gets a fee of 5 per cent. on the Government revenue paid by the proprietary body. In the Punjab I think the village expenses used to be separately provided for; but certainly with us he pays everything out of his per-centage.

1387. Do you know if any margin is left?—A considerable one, because it is a post very much sought after; the new tenants all come to him, and he has a number of other fees which he gets on marriages and other things of that kind, as the head of the village.

1388. Do you think that we may look to a considerable increase of revenue from the development of the mineral resources by the Government?—I would not say a very considerable increase, but I think that the mineral resources of the Central Provinces may be very largely developed; I think that in the next settlement we are likely to get a large increase in the land revenue, when this settlement lapses and the new one is made. The next settlement should be from 25 to 50 per cent. increase, I think, if things go on as they are.

1389. Has anything been done by Government to develop the mineral resources of the Central Provinces?—Yes, they have sunk one or two shafts: there are certain officers appointed, who are now actively employed in searching for coal, and the Government is now considering the question of the railway to Chanda.

1390. The Government have given over the working of the mines where the railway is actually running, to the railway company, have they not?—The working of the coal mines has not been given to the railway company in the Central Provinces. In the Nerbudda Valley there is the Nerbudda Coal and Iron Company, who have the working of that.

1391. Have they the right of selling part of the coal, besides using it for their own purpose?—The Nerbudda Company may do what they like with it; I do not think that they have given over any coal to the railway company.

1392. *Chairman.*] Government have a theory that they ought not to grant coal to a railway company, have they not?—Yes; that it would be rather a monopoly.

1393. *Mr. Eastwick.*] Will you look into that point, whether the Government have given the right of working the coal to the railway company?—They have certainly given it to the Nerbudda Company, but they are separate from the railway company.

1394. Has the Government model cotton farms?—Yes, it has.

1395. Has it got one at Hingunghat?—Yes; it has been removed now from that to the place where I said we were making the cotton experiments.

1396. Within close access to the railway?—Within 10 miles, I think.

1397. If it could be close upon the railway that would be a great advantage, I suppose?—Yes, but 10 miles is quite sufficiently close. The object of a farm would be very much more, I think, to teach the people what improvements they might effect, than for the purpose of taking away the produce.

1398. Has it been found that the people have really improved their cultivation in cotton from the experiments at that model farm?—They certainly are quite open to improving, and they have improved considerably from what has been done by the exertions of the Cotton Commissioner.

1399. These provinces are great cotton exporting provinces, are they not?—Yes, the southern portions of the Central Provinces are.

1400. *Mr. B. Denison.*] With regard to the expenses

expenses of collection in the Central Provinces, have the establishments in the Central Provinces been formed on the model of the Punjab and the other provinces, or are they something peculiar to the Central Provinces?—They have been formed on the model of the Punjab, I think, as nearly as possible, except that they are on a smaller scale even than the Punjab, and less expensive; it is more on the form of the Punjab than of the North West Provinces.

1401. Will you say whether, in estimating the expenses of the collection of revenue, and the salaries of deputy commissioners and their subordinates, are estimated at one-half, or in what proportion?—I believe it is at one-half, half to the Revenue, and half to the Judicial Department; that applies to the Commissioner, the Deputy Commissioner, and their assistants, and, I believe, also to some native officials; but I am not quite sure about that.

1402. I think the tendency of your evidence before the Committee has been to impress upon us that what is taken from the proprietors of the soil as land revenue, is in the nature of revenue, and not as a final tax, final for all purposes?—Certainly that is what I mean; that it is merely land revenue as land revenue; but the Government have the option open to them, I think, of imposing other taxes, if they think fit, provided a direct and immediate benefit can be shown in return for which these taxes are to be paid.

1403. Then should you conclude from your experience of the Central Provinces that the temper of the people in the other districts where the land revenue settlement is now of long standing, would be the same as in the Central Provinces with regard to extra taxes?—I think in the North Western Provinces the people have no doubt come to look on the extra cesses as being as fixed and immutable as the land revenue. They have not perhaps been given to understand that the Government did reserve to itself certain rights to fix these taxes, but the people have come to consider that the road and the educational cesses rate are as fixed as the Government revenue.

1404. Do you know whether either in the Central Provinces or in any other parts of India, objection and remonstrance has been made by the holders of rent-free tenures to these cesses, the road cess and the educational cess?—I do not recollect any particular case of remonstrance, but there was something in the North Western Provinces about it. At Allahabad something came up about it; I do not recollect, however, whether the Government take the road and educational cesses from the rent-free tenures in the North West Provinces.

1405. You have said more than once, have you not, that in the event of any great local improvement, such as a road or a canal being imposed, the advantage of which could be made clear to the occupiers of the adjoining lands, there would be no objection on their part to contribute a cess towards the erection and maintenance of them?—They might object, but I do not think it would be a valid objection, but one that might be overruled. If they could show that the benefit was not so direct or immediate as the Government assumed it to be, and that the Government were incorrect in their data, then I think they would have good grounds for resisting the tax; but if the only objection was that the Government assessment had been finally

fixed at the time of the settlement, I do not think that ground of objection would be a good one.

1406. For instance, in the case of a canal, you do not see any objection to calling upon neighbouring proprietors to contribute to the expenses though they may not want to have the water?—Yes, I do. I do not go the length of saying that, in such a case, you can make a man pay, because I do not see what the direct benefit would be to him. In the case of a road, he would have the benefit, whether he wished it or not; but in the case of irrigation, he would not get any benefit from the water unless he took it.

1407. But are you aware that, in other parts, some canal officers have insisted upon charging water rent to proprietors who have refused to take the water?—Yes, that has been proposed, and it has been argued that the objection of the few should not militate against the good of the many, but I think it is, perhaps, pushing it to an extreme. In fact, I may say that, by taking the other course, the people themselves would see their neighbours benefiting so much from the water that they would soon get it for themselves.

1408. But supposing your principles were carried out, you do not apprehend any political danger?—I do not in the Central Provinces, certainly; but at the same time I wish it to be observed, that the measure would be a tentative measure; and in proposing this plan for the Rycpore Railway, I meant that the Government should leave it to me to see how far we could realise this, and that if we found that there was difficulty in realising this, then we should get the revenue from other sources.

1409. Do not you think that the temper of the people in the Central Provinces may be, in a great measure, owing to the newness of the administration, as it were, and their inaptitude to call in question Government measures?—Partly so, perhaps. I think that we might say on the other side, that the temper of the people in other parts of India may, perhaps, have been induced by the Government not having sufficiently asserted their rights, and the people having assumed that they had certain rights and privileges which in reality they ought not to possess.

1410. But it would not be incorrect, would it, to say, that the population of the Central Provinces are a more simple and unsophisticated population than that of other parts of India?—They are a more simple and a quieter race than they are in the North West and the Punjab.

1411. Was there a Government income tax imposed in the Central Provinces?—Yes.

1412. Mr. Grant Duff.] I understand that you have not given particular attention to the general policy of the Government of India throughout India, with regard to the waste lands?—I have not given particular attention to its effect. I have considered the principle, but I do not know what the effect may have been on the different provinces, that is to say, how much land has been sold, or what has been done with it, or what has been done with the proceeds.

1413. Mr. J. B. Smith.] You have stated that with regard to the late discoveries of coal at Chunda, it is proposed to have a railway to carry it to the Great Peninsula Railway?—Yes.

Mr. J. H. Morris.

18 April 1871.

Mr. J. H.
Morris.

18 April
1871.

1414. Do you know what distance that is?—It is 49 miles.

1415. Is it not more from Chunda?—There has been a discovery since at a place called Wurdah.

1416. But at Chunda could not an excavation be made from the river up to the main?—Ten or twelve miles below Chunda the coal is found close to the river.

1417. Would it not be desirable instead of making a railway for the purpose to send the coal by the river?—There are barriers in that river which you could hardly surmount.

1418. Then this railway from the collieries is to be made to the Peninsular Railway?—To Wurdah station.

1419. If the barriers are below you might bring it up the river to the railway, might you not?—I do not think there is sufficient water.

1420. Has there been any estimate of the cost of making that river navigable all the year round?—Yes; the whole subject of the navigation of the Godavery, from the mouth up to Wurdah has been considered, and the entire cost would be 2,300,000 £.

1421. When was that estimate made?—About six or eight months ago, just as I was leaving India, and I minuted on it to Government, and made a report on the subject.

1422. I am speaking of that portion of the river from Chunda to the Wurdah; do you know what the estimate is of the expense of rendering that portion of the river navigable?—It will be found stated in my minute, I think.

1423. *Chairman.* Do you consider that the Central Provinces have an exceptionally small quantity of culturable land as compared with other parts of India?—No, I think that they have a very large amount of culturable land.

1424. I mean land capable of tillage?—Yes, culturable land, capable of tillage. I think the want of the Central Provinces is not the absence of land, but of cultivators to cultivate it; it is a very sparse population.

1425. Do you consider that there is as much land capable of tillage culture in the Central Provinces as there is in the North Western Provinces?—I think that in the North West the per-centage of the culturable land to the cultivation is much smaller than it is with us. Our culturable land is more than equal in amount to our cultivated.

1426. You mean that your culturable land, which is not cultivated, is more than the amount which is cultivated?—Yes.

1427. Are we to understand that the two-thirds which you spoke of as being let out to villages, of what you called uncultivated land, was land capable of culture?—The 200 per cent. is land capable of cultivation, waste land for grazing, and everything, that includes all. The people themselves were in a measure allowed to select what land they liked, provided it lay contiguous to their own land, and they generally selected the best.

1428. Do you attribute the present comparatively depressed state of the Central Provinces to the want of population?—Yes, that is one of the chief causes.

1429. I observe that the contrast is very striking with the North Western Provinces. In the North Western Provinces they have an area of 83,000 square miles, and the land revenue is 4,000,000 £; whereas the Central Provinces

have an area of 114,000 square miles, and the land revenue is only 600,000 £. How much of the 83,000 square miles is cultivated?—The last annual report of the North Western Provinces ought to give that, and that would show it at once.

1430. The population of the North Western Provinces is 30,000,000, as compared with 9,000,000 for the Central Provinces?—Yes.

1431. But although that is the proportion of the population, yet it would appear that the revenue in the North Western Provinces is far greater in proportion than the population?—Yes; but I think, as a general rule, the quality of the soil in the Central Provinces is very much below that of the North West Provinces.

1432. Will you explain what is the cause of the difference, and this extraordinary depression of the Central Provinces as compared with the North Western Provinces?—First, I think the sparseness of the population; secondly, that the inherent quality of the soil is inferior; and thirdly, that the nature of the cultivation, in consequence of the idle, and lazy, and improvident habits of the people, is very inferior.

1433. As regards foreign markets, they are nearer to them than the North Western Provinces?—Yes, they are nearer to Bombay.

1434. *Mr. Eastwick.* There are immense jungles, are there not, down at Bustar particularly?—Yes; the whole country is jungle. You can imagine what it must be, when I mention the fact that in the upper Godavery district, in which this place Bustar is, the number of the population to the square mile is only 22.

1435. *Chairman.* Then according to the calculation we have just made, there is a great future for the Central Provinces if the population increases, and the land could be cultivated properly?—Yes, those are the two great wants; and the proper cultivation of the land by the introduction, if we possibly can manage it, of means of irrigation.

1436. I forget whether you stated the proportionate part of the Central Provinces that was in the hands of chiefs?—I have not that exactly; but I should think a sixth or a seventh of it; at least 10 per cent.

1437. From that the Government will get no benefit?—The Government would only get the indirect benefit of being able to raise their tribute; but that would never be anything like what that proportion would indicate.

1438. Do you consider that they have the right to raise it on those lands?—Yes; we have just raised the tribute, and it was made under the express stipulation that it might be resettled at the end of 20 years; the object of revising was not so much to increase the revenue, as to prove to the chiefs that the revenue was revisable. I proposed, for instance, in introducing this Ry-pore Railway, that the chiefs should be made to contribute.

1439. *Sir D. Wedderburn.* I find in the map published by the India Office in 1869 that these feudatory states, Bustar and the others, are marked as native territories, and in the map which hangs in this room, which is of the same date, they are marked as British territories; and the same thing with regard to the Berars; are they held under the British Government directly?—The Berars really belong to the Nizam, but they are directly managed by European agency under the Resident at Hyderabad; and we have introduced our

own system there; whereas in regard to these feudatories they are only, I may say, indirectly administered by us. We content ourselves with the tribute, and allow them to administer them themselves.

1440. Then Berar is an integral portion of the Central Provinces?—No, it is part of Hyderabad, not of the Central Provinces.

1441. It is marked in one map as British territory, and in the other it is marked as part of the Nizam's territory?—Yes; but it is directly administered by Government officers under the Resident.

1442. Is it not the case that a large portion of the Central Provinces is inhabited by aboriginal races, Gonds and others, which are very inferior races?—Yes, very nearly 2,000,000 out of the 9,000,000 of the inhabitants are Gonds and aborigines, men who cultivate the land with the axe, you may say, instead of the plough; they cut down the jungle and set fire to it and sow the seed in the ashes, and make what they can of it.

1443. Are these the men who have contrived to lower the fertility of the black soil to the extent which you have described?—No; ordinary Hindoo cultivators who have gone on cropping and cropping, getting what they can out of the soil, and doing nothing for it.

1444. That is exceptional, is it not, among Hindoos?—Many of these Hindoo cultivators are inferior castes. In the Nerbudda Valley you will find they have by marriage intermingled with the aborigines, and now they are a kind of mongrel race, between Rajpoots and Gonds.

1445. Mr. Fawcett.] You describe the settlement in the Central Provinces as a landlord settlement in contradistinction with that of Madras: the Government made the settlement with the landlords and not the cultivators?—Yes.

1446. Do these landlords deal liberally with the cultivators?—Yes, fairly so; but at the same time the Government has protected the rights of the cultivators in the Central Provinces.

1447. So as to prevent the landlords levying an excessive rent from them?—Yes. The cultivators in the Central Provinces have been divided into certain classes. This question of the rights of the cultivators was gone into and investigated at the time of the settlement as carefully as the rights of the proprietors. We have three different classes of cultivators. First, there are cultivators whose rights are very strong, but not sufficiently strong to entitle them to be declared proprietors of their holding; they were considered cultivators with rights of occupancy, that is, not liable to ouster, and with the rent fixed for the term of settlement; and this fixing of the rent was decided on by the settlement officer in conjunction with the landlord. Then there is a second class of cultivators whose rights were not found to be so strong as that of this first class; they were declared to have rights of occupancy under a certain Revenue Act in India, but to have their rent liable to enhancement under certain conditions which have to be proved in the courts, and then the enhancement takes place or not according to the decision of the courts. And then in addition to them there are the ordinary tenants-at-will, tenants from year to year, who are liable to ouster or enhancement, on receiving notice from the landlord.

1448. Is a considerable portion of the cultivated land occupied by tenants-at-will?—There are 158,075 cultivators holding at fixed rates; 0.59.

140,220 cultivators with rights of occupancy at variable rates; and 474,656 tenants-at-will. That is to say, two-fifths of the whole of the cultivators have rights of occupancy.

1449. In one case, however, they are only variable rates?—As long as they pay the rent the cultivators of the second class are not liable to ouster, and they are not liable to enhancement of revenue except on certain conditions.

1450. Three-fifths of the tenancies in the Central Provinces may be regarded as exhibiting an extremely unsatisfactory state of land tenure, tenants-at-will not protected by the Government at all?—Two-fifths are very strongly protected.

1451. But with regard to these three-fifths of the tenants, the mere fact that the Government levies a light land revenue, does not give the slightest security that these tenants-at-will have not to pay an extortionate rent; the Government cannot protect them from that, can it?—The Government may not perhaps be able to protect them, but Government has not in any way lowered their status, or placed them in any other position with reference to their landlords than that they have always held, and if the landlord takes a greater rent than his neighbour they only have to go to his neighbour, who is only too glad to get them.

1452. But it is to be distinctly understood that the land assessment being light, does not, with regard to the majority of the tenants, give them any security against their landlords?—No; but these tenants-at-will are only men who have held for a few years; they have not held under any condition that entitled them to any right; it is only where they are proved to have been introduced by the landlord, to have held from him from year to year, and to have exercised no rights or privileges, that the Government have declared that they have none; but where they have exercised rights of any kind the Government have confirmed them in them. The principle Government has gone on is not to create rights in their favour, more especially as this could only be done at the expense of the landlords, but where they have found rights to exist it has declared them permanent and recognised them. The mere fact of two-thirds of the tenants being tenants-at-will only proves that a large proportion of the cultivators formerly exercised no rights of any kind.

1453. Do not you attribute a portion of the unsatisfactory cultivation which you say exists in the Central Provinces, to the fact that the larger part of the tenancies are simply tenancies-at-will?—No; I do not think so. I think that, they are generally in very fair circumstances, and I find that on the average, the tenants-at-will do not pay higher rates than cultivators with rights of occupancy paying at fixed rates. The average rate per acre at which a tenant-at-will pays is 13 annas and 6 pies, and the average rate at which the ryot holding at a fixed rate pays is 13 annas 11 pies. I should explain that the land in the possession of the ryots paying at a fixed rate is probably of a somewhat better quality than that held by the tenants-at-will; but still the above fact clearly shows that the tenants-at-will are not very much ground down. The fact is that there is such a want of tenants, and such a superabundance of land in the Central Provinces, that the tenants can command almost any price they like.

Mr. J. H. Morris.

18 April 1871.

Colonel Sir ARTHUR P. PHAYRE, K.C.S.I., called in ; and Examined.

Col. Sir A.P.
Phayre,
K.C.S.I.
—
18 April
1871.

1451. (*Chairman.*) Will you be good enough to state what offices you have held in India?—I was Deputy Commissioner in Aracan first, part of British Burmah; afterwards I was Commissioner in Pegu, another part of British Burmah; and latterly I was Chief Commissioner of the whole Province of British Burmah.

1455. And you are acquainted with the system of land revenue in British Burmah?—Yes.

1456. Would you be good enough to state when the administration of the land revenue in British Burmah began?—Pegu became part of the British Empire in 1852, and from that time Pegu was settled; before that the two Provinces of Aracan and Tenasserim were under British rule since the year 1826.

1457. When was any settlement made of Aracan?—From the first occupation of it. I would say not a settlement, but there was an annual inquiry and an annual assessment; there was no settlement indeed; there has been no settlement of the land revenue in any part of British Burmah, until about six or seven years ago, for any term of years; I mean that the settlements were always annual up to that time.

1458. What was the position of the land revenue when the Government began to administer Aracan?—The cultivators and proprietors of the soil paid an annual revenue to the Burmese Government of 10 per cent. of the gross produce.

1459. Was that paid in kind?—It was paid in kind invariably for grain land; that was not the case on land on which other produce was grown; but grain land, which was more extensive than any other kind of land, invariably paid in produce.

1460. And for the rest of the land the revenue was collected in money?—Not always, but in many respects it was.

1461. When was a change made in that system?—What I have just spoken of was under the native government, but as soon as the country came under the British Government, an arrangement was at once made for money payment in lieu of a per-centage of the gross produce being given. That commenced in Aracan and Tenasserim from the year 1826, and in Pegu from 1852.

1462. Was that money payment at the same rate as the proportion in kind, one-tenth, or was it otherwise?—It was not the same. As soon as the British Government came in, in consequence of its being made easier to the cultivator by a money payment, the proportion taken by the Government, or assumed to be the Government share, was doubled. Under the native government it was 10 per cent., but the individual had to convey the proceeds to a Government granary, or to some other place; sometimes to a Government officer's house. That was no longer required of him; and then 20 per cent. of the gross proceeds was assumed, and that was commuted for a money payment of the supposed value of the 20 per cent.

1463. Was the same proportion established with reference to other agricultural produce, namely, 20 per cent.?—No direct inquiry was made as to the value of the other produce, but it

was arranged with the people of each village tract that the highest rate taken for their rice land in each village tract should be the ruling rate for all other produce in such village tract.

1464. How was the rate established between that particular produce and other produce?—There was no attempt to make any detailed inquiry on the subject. The people of the village agreed that that would be a good rate to assume, and they were content to pay it on that ground.

1465. Was this arrangement made with the actual cultivator, or with any intermediate person?—With the actual cultivator.

1466. All through the country?—Yes.

1467. Then there are no intermediate managers, or village holders, or other officials, between the Government and the people?—There are not. There is a Government official in each village tract, but he deals directly with each holder and cultivator.

1468. He is a mere agent for the collection of the revenue?—Yes; excepting as he represents the Government generally.

1469. Does he assess this 20 per cent.?—Under the British Government he does not; that was done by an officer specially appointed for the purpose.

1470. Then when the value of 20 per cent. in cash was fixed in the first instance, was that value continued from year to year, or has it been changed at intervals?—It has been changed; it has been increased occasionally, but that has only happened, I think, once or twice during my time.

1471. That is since the acquisition of the provinces by the British Government?—Yes.

1472. That would make the settlement or the arrangement in point of fact last for an interval of how many years?—The longest settlement that has been made in any part of British Burmah is ten years; indeed everywhere the people objected very strongly to settlements; they said they preferred an annual arrangement, but they were induced, by the persuasion of Government officers, I may say, to accept settlements in some cases for five years, in others they would not take above three years.

1473. But when the assessment or settlement has been annual, how often, at what intervals, has it been changed?—I have never known it changed at less intervals than 10 years or 12 years.

1474. Can you state what extent of territory in the Burmese Provinces is now under settlement as compared with land not under settlement?—I should think about one-third probably of the whole cultivated land was under settlement for a certain period, but not all for the same period. As I have stated it was difficult to induce the people to accept settlements.

1475. And the rest is from year to year, liable to be resettled at any time?—Yes; liable to be resettled at any time.

1476. Can you state how much of the whole territory consists of land which is occupied and cultivated so as to be chargeable with revenue?—There are only about 3,000 square miles that are under cultivation.

1477. What is the whole amount?—The whole is about 94,000 square miles.

1478. What

1478. What is the rest of the land composed of; of what character is it?—Jungle, forest-trees, grass: and about one-half of the whole mountains covered with forests.

1479. Is any of that land capable of being tilled and cultivated?—A great portion of it except the hill portion.

1480. Can you state what quantity of land remains in Burmah that could be tilled that is not now liable to assessment?—Probably 30,000 to 40,000 square miles.

1481. That would all be liable to assessment the moment it was cultivated?—Not immediately, because all forest jungle land is allowed to be cultivated on the arrangement that for a certain number of years it is to be exempt from revenue, and then to come gradually under assessment.

1482. What I want to ask you is, whether the revenue is charged only upon the land that is actually under cultivation, or whether the occupants claim the right of any of the uncultivated land?—The villagers claim certain uncultivated lands round their villages for pasture and so on, but they do not pay revenue on that land.

1483. The revenue, in fact, covers the pasture land as well as the tillage land?—It does.

1484. Then the quantity of land which they hold is very limited?—Comparatively very limited.

1485. I suppose that the large areas which you have spoken of are not in fact comprised within the villages with which the settlement has been made?—They are not.

1486. What does the Government derive from these uncultivated lands at present?—They do not derive any revenue from the uncultivated lands. It is at the disposal of Government to make grants, which they do; and besides that, great numbers of people come in as immigrants from independent Burmah, and are allowed to take up lands by the head people of the villages on the terms which have already been stated, and those persons do not pay for those lands until they have raised a crop from them.

1487. But there are no licenses issued for pasture and otherwise in the large unsettled districts?—No licenses are issued; persons may pasture their cattle without any permission at all.

1488. Can you state what has been the progress of the land revenue under the system which you have been describing?—I can state it generally without giving the particular figures. For the last 15 to 16 years the land revenue has increased at the rate of about 5,000 l. a year.

1489. What do you anticipate will be the future increase?—I anticipate that it will be at that rate for a great many years to come. Large numbers of people are flocking in both from the Burmese territory and from the Siamese territory, and they can easily take up lands, and they most readily do so on the terms offered. They take them in small patches, seldom exceeding eight to ten acres, and they are the best kind of cultivators that we have.

1490. Are the holdings generally large in Burmah or small?—They are small for grain lands, seldom exceeding 10 acres; and for garden lands very much less, probably not more than three or four acres on the average.

1491. Is the revenue generally paid well within the year?—It is paid very promptly; 0.69.

there are very few defaulters indeed; I scarcely remember a Burmese defaulter.

1492. The Government claims the power, I suppose, of turning out the occupant, or selling the land in case the revenue is not paid?—The Government do claim that right, but I have never known more than one or two instances, I think, of land being sold for non-payment of revenue.

1493. Are these occupants who pay the revenue considered the owners of the land for all purposes?—Every immigrant who comes into the country and occupies land under the Government, and pays his revenue, is treated at once as the owner of it.

1494. He is at liberty to sell and deal with his land as he pleases?—If he can.

1495. Mr. Lyttelton.] What objection have the people to a long settlement?—It is very difficult to know exactly what the real objection is, but I think the general idea was that if they pledged themselves to pay a certain sum for a certain number of years and became unfortunate, they might be thrown into prison for the arrears, and they thought it better to merely pay their way by the year. But every possible effort was made to show them that if they were unfortunate, lost their cattle and so on, and could not cultivate their land they would not be required to pay the amount.

1496. Was the rate higher in the case of the longer settlement?—No, it was not, the rates per acre on the land remained the same in either case.

1497. The objection in reality was an unreasonable one?—Yes.

1498. Mr. J. B. Smith.] Supposing that the Government executes public works, have they any right to assess the people for those?—Yes; I think they have for the benefit of the whole.

1499. Has any experiment of that kind been made: have they ever been called upon to contribute?—Within the last six or seven years, for the first time in Burmah, a cess has been laid for public roads, for education, and for rural police.

1500. And has it been cheerfully paid?—It has been cheerfully paid; I never heard any objection to it.

1501. The people appreciate the benefits to be derived from it?—Undoubtedly they do.

1502. Mr. Eustwick.] Where do these immigrants come from that come into the Burmese Provinces?—From the Burmese territory and from the Siamese territory.

1503. Not from India?—Very few, comparatively: people from India come as workpeople in the seaport towns, but very few of those ever settle down in the country: after remaining for three or four years, and making a certain sum, they go back to their own country: still there are a few straggling settlers, but, as a general rule, very few indeed.

1504. The soil is good, I suppose?—Very good soil.

1505. There are great facilities for irrigation; I suppose?—Irrigation is very little required in British Burmah; the object of the public works, in fact, as regards agriculture is to keep out floods by damming the rivers; the rainfall is very large and the rivers rise very high: irrigation is only known as an exotic work in a few corners of the province.

1506. Then, in fact, all you want is population?—Yes.

1507. And

Col. Sir A.P.
Phayre,
K.C.S.I.
18 April
1871.

Col. Sir A. P.
Phayre.
K.C.S.I.
18 April
1871.

1507. And may I ask whether Government has ever thought, or anyone has ever thought, of introducing Chinese there?—It has been thought of, and I was at one time in communication with Mr. Jay in China, regarding Chinese who were expected to have been taken as prisoners during the time of the rebellion there, but the Government of India did not approve of Government themselves entering into the work of bringing immigrants into the country, and it was left to private enterprise to accomplish it, if necessary.

1508. And I suppose nothing has been done since?—Nothing.

1509. But with regard to your own opinion, supposing that it could be arranged by private enterprise or in any other way to bring about a great immigration of Chinese, do not you think that it would be a very profitable thing for the Government?—I must say that I have altered my opinion since those days when I was perhaps too anxious to push on the province, and I do not think it right for Government to introduce immigrants themselves. I think the best way is to remove all obstacles and to offer every advantage to them for coming, and to leave them, as the immigrants come now from Burmah and Siam, to their own efforts and to the efforts of those who wish to profit by their labour.

1510. But you think that the country offers very great advantages to immigrants?—Decidedly; they are pouring in now in large numbers.

1511. It is an unhealthy country, is it not?—By no means; it is much healthier than Bengal generally; I will not say than the North West Provinces or the Punjaub, but it is a very healthy climate.

1512. One has heard of the Aracan fever?—The climate of Aracan is, I admit, an unhealthy climate. I was thinking that you meant Pegu and Tenasserim.

1513. Does the Government derive any revenue from the forests in Burmah?—Government derives now a considerable revenue from the forests, because they are kept entirely in Government hands; that is to say no one is allowed to fell a tree except with the permission of the Forest Department, and the trees are either sold beforehand or else are felled by the Government on their own account; so that the department not only pays its own expenses, but it has an income probably of some 40,000 £. or 50,000 £. a year.

1514. Do you see any likelihood of increasing that revenue from the forests; I suppose they are teak forests?—They are teak forests. I think there is every probability of its being increased, because the forests are every day becoming better taken care of, and the watching is more economical, and the whole working more profitable than it used to be.

1515. Are the forests on the hills of any value?—All the teak forests are on hills; not very high; the best are on hills probably from 1,200 to 1,500 or 2,000 feet high.

1516. Are there good communications, or is there a great want of communications?—There is a great want of communications.

1517. And, probably, with communications there would be a greater inducement to immigrants to come into the country, and also a greater development of the agricultural resources?—No doubt there would be; not that the immigrants think much of the communica-

tions, I think; but it would be more profitable to them in bringing their produce to market.

1518. Is there any mineral property in the country?—Very little indeed; there are a few petroleum wells, very small, and a few deposits of coal have been found here and there, but not sufficient to be of any economic value.

1519. Then the Government must look to the agricultural produce and the forests?—Yes, undoubtedly.

1520. Mr. B. Denison.] Is there a local export duty on timber from the Burmese Provinces first into British territory, and then into foreign territory?—The teak timber that comes from the Burmese territory has an export duty levied upon it by the foreign Burmese authorities; I think it is, probably, 10 per cent.

1521. I meant at the port of Rangoon and other places which are British ports, is there an export duty on timber?—No, there is none, it is quite free.

1522. With reference to timber coming from higher up the country, how is it?—With regard to the timber that is floated down the rivers into the British territory, that from the Burmese territory pays 10 per cent. to the Burmese authorities, none to the British authorities. Then in the Tenasserim Provinces the timber, which comes from the Siamese territory, and partly from some independent states, does not pay to the British Government any duty on passing the frontier, but it pays what may be called an excise duty within the territory, which amounts to probably about 10 per cent. of the value.

1523. Pays it to whom?—That it pays to the British Government.

1524. An honourable Member reminds me that wood floated down the great rivers does pay a transit duty to the British Government, does it not?—Not that on the Irawaddy, but that on the Salween river does; what is floated down on the Salween does not pay on the frontier, but it pays what may be called an excise duty in the province, levied after it comes into the province.

1525. Do you know, approximately, what the annual amount of that duty is?—It is close on a lac of rupees.

1526. Do you know whether it is credited under the head of forest receipts, or under custom or excise receipts?—It is under the head of forest receipts, but there is a sub-heading, showing that is levied as a timber duty, and does not consist of profits derived from the Government forests.

1527. Is the tariff of the customs duties levied at the ports of the Burmese territory the same as the Calcutta tariff?—Precisely the same.

1528. Do you regard the general question of taxation in Burmah as an open question in the future, that is to say, that it has not been finally settled with regard to the land revenue?—There is nothing finally settled as to the land revenue in Burmah; it is quite an open question.

1529. The principle on which the final settlement is to be made is an open question?—Quite so.

1530. Mr. Grant Duff.] You are satisfied that the people are not over assessed?—Certainly, they are not over assessed.

1531. And is the land revenue rising steadily?—It is rising steadily.

1532. So that 50 years hence it may be doubled?—Certainly.

1533. Without being oppressive?—Yes, without

out being oppressive; that is to say, it would be doubled from the extension of cultivation; I do not mean that it would be doubled by increasing the rates per acre.

1534. But in the natural order of things you think that it would about double itself in the next 50 years?—Yes, I think so; it has been going on very steadily, and there seems to be no check.

1535. *Chairman.*] What do you suppose is the present rate of increase on the average for the last two or three years; because you have spoken of an increase at the rate of 5,000 *l.* a year?—When I said 5,000 *l.* a year, I meant the ratio. I did not mean with reference to the total, which the revenue would be with the 5,000 *l.* added at the end of 10 or 12 years, but the ratio, with regard to the increase that occurred on the total, as it was 10 or 12 years ago.

1536. What do you expect will be the actual addition to the land revenue from year to year?—I would suppose that the land revenue might possibly double itself in 50 years.

1537. Would that increase arise from the increase of cultivation, or from the increase in prices, and the consequent rate of assessment?—From both, but more particularly from the increase of cultivation.

1538. That is, supposing no special means were taken to increase the population, but it took its natural course?—Quite so.

1539. The costs of collection in Burmah are stated to be 97,000 *l.*; but it is also further explained that that is made up of two items, "Deputy Commissioners' Salaries, Establishment, and Contingent Charges," 41,000 *l.*, and there is the "Commission on Collection of Land-tax," 47,000 *l.*; what is the meaning of those two items?—I apprehend that the 47,000 *l.* refers to the commission given to the heads of villages who receive 10 per cent. on the collections.

1540. That is paid by the Government, not by the villagers?—That is paid by the Government, and deducted from the amount collected; and the other is the salary of the Deputy Commissioner and the other officers of the Revenue Department.

1541. Do they perform any other functions for those salaries, or is that only a portion of their salary?—That is only a portion of their salary.

1542. And the rest of the salary is debited to the other class of duties that they perform?—Yes.

1543. *Mr. Cave.*] Did you say that the Chinese had begun to come in of their own accord as immigrants into Burmah?—They have begun to come in, but not as agricultural settlers; the Chinese are principally artisans in the towns and so on, but they come in entirely of their own accord; they come as merchants and artisans, and so on, but not as agriculturists.

1544. Do they remain?—They remain.

1545. Do Chinese women come in as well as men?—Very few women.

1546. Do the Chinese intermarry with the Col. Sir A.P. Burmese?—Yes. *Phayre,*

K.C.S.I.

18 April
1871.

1547. Those people respecting whom you were in communication with Mr. Lay were people taken in the rebellion, were they not?—They were.

1548. They were executed, were they not afterwards?—I believe many thousands of them were.

1549. Are the Chinese easily managed in Burmah; are they an orderly set?—They are; I have not found any difficulty in that respect. In Rangoon there are about 5,000 or 6,000 of them; in another town, Moulmein, there are about 10,000; they do not give trouble.

1550. I suppose that their taking to trade in the way that they do there, and in other places, drives the natives more to agriculture than before?—It does.

1551. So that in that way it increases the agricultural population?—It does.

1552. *Chairman.*] You stated that generally the settlement was made with the occupants, but are there any chiefs in Burmah, or persons regarded as large holders, with special tenures?—None at all; there are a few old families who held office under the old government, and perhaps may have accumulated a little more land, perhaps to the extent of 40 or 50 acres, but I never met with any one who owned more than 50 or 60 acres.

1553. There is nothing between the Government and the mass of the people, who are face to face with them?—Quite so.

1554. *Mr. B. Denison.*] There is no direct means of communication over land between Burmah and Aracan, is there?—There is, but it is a difficult route across mountains.

1555. What is the distance?—To the seashore and by the road across the hills, it is about 110 miles.

1556. Is it a safe road and a practicable road; safe, I mean, from wild animals?—Wild animals are to be met with; still many people go that way.

1557. Did you yourself, in making your progress through the provinces, generally use a steamer?—To go up the Irawaddy River, I did.

1558. And to get round to Aracan?—I generally went by sea.

1559. That is the usual way of communication, is it?—Yes.

1560. What is the time it takes to go from Burmah to Aracan by sea?—Three days.

1561. *Sir D. Wedderburn.*] Do they speak distinct languages in Aracan and Burmah?—The language is essentially the same, but there is a difference of dialect; it is the same race also.

1562. *Chairman.*] Can you state the number of people with whom the settlement is made as occupiers or owners of land, that is to say, the number of persons directly holding from the Government?—The approximate number of persons paying land revenue direct to Government is 370,967.

Friday, 21st April 1871.

MEMBERS PRESENT :

Sir Charles Wingfield.

THE RIGHT HONOURABLE ACTON SMEE AYRTON, IN THE CHAIR.

Sir ROBERT MONTGOMERY, K.C.B., G.C.S.I., recalled; and further Examined.

Sir R.
Montgomery,
K.C.B.,
G.C.S.I.

21 April
1871.

1563. *Chairman.*] WHEN you were last examined, you mentioned that you were conversant also with the land revenue administration of the North Western Provinces?—Yes.

1564. Will you be good enough to tell us what districts now constitute the North Western Provinces?—The North Western Provinces are composed of districts ceded from Oude and conquered from the Mahrattas between 1801 and 1805. Subsequently the Kumaon and Dehra Dhoon districts were ceded by Nepal in 1815, and in 1817 Bundelcund was conquered from Scindia, and added to those districts for the purpose of a more convenient administration, four districts of the permanently-settled province of Bengal were added to the North West Provinces.

1565. What districts were those three?—Benares, Jounpore, Mirzapore, and Ghazeepore; they were for administrative convenience transferred to the north-west; these altogether now form the North Western Provinces.

1566. You did not give us the names of the districts first acquired in the earliest acquisition by the North Western Provinces?—From Oude were transferred Goruckpore, Azimgurh, Allahabad, Cawnpore, Futtypore, Furruckabad, and the Rohileund territory; and conquered from the Mahrattas was the Agra and the Delhi territory. I think that generally comprises the districts then acquired.

1567. Will you be good enough to state very shortly what was the land revenue system that was in force in the different districts, with a view to explaining the changes introduced by the present system?—At that time the Government of the day took as much revenue as they could get, nominally allowing about 15 per cent. of the net assets to the proprietor; that in general terms, I think, was the system. It varied, perhaps, but that generally was the system of the native governments, to take as much as they could, less about 15 per cent.

1568. Do you mean 15 per cent. of what an

occupying tenant would pay to a landlord, or 15 per cent. only of the profits of the cultivator?—Of the supposed rent that the cultivator would pay to the landlord.

1569. Was that systematically levied, or was it merely carried in every district to the extreme limit of exaction?—Generally speaking the country was farmed out, I think, to different farmers of the revenue. The greater part was farmed out, and they had to pay in a rough calculation the total collection, less 15 per cent. That was a rough way, I should say, of expressing it.

1570. Were the farmers large farmers?—Sometimes farmers of a large tract of country; perhaps one, or two, or three districts.

1571. But never less than one village?—Never less than one village.

1572. Was that an annual assessment?—Yes.

1573. I presume there were remissions, if there were scarcity?—That depended upon the pleasure of the Government. I presume there were if they could not get the revenue.

1574. What changes were made by the British Government as it acquired these several districts?—When we first got possession of the country it was entirely new to us; we had no experience of any similar tract of country in India; and officers were sent from Bengal, which was our old province, to carry out the administration of the country. These officers were very ignorant of the state of things existing in the North Western Provinces. The tenures were altogether different; the state of the country was different; it required much more capital to break up the land there than it did in Bengal, because it was a very arid country compared with Bengal, and the water was a great depth, and they have not the same favourable periodical rains that they have in Bengal; and the officers were ignorant apparently of the existence of the large proprietary communities in the North Western Provinces; they did not exist in Bengal, or if they

they had existed there they were in a much less perfect state there than they were in the North Western Provinces. When our officers received from the native governments the list comprising the different estates in the North Western Provinces they found one or two names entered upon the list as the proprietors of the estates, and our officers supposed that they were really the sole proprietors. The custom in Bengal was that when an arrear of revenue took place the estate was put up for sale if the revenue was not paid in by a certain date. They carried out the same system in the north-west; they ordered that if by a certain date the revenue was not paid, the estate was to be sold. The people were altogether ignorant of sales; they had never heard of land being sold for arrears of revenue; they were unacquainted with the system altogether, and in many cases it was proved subsequently that the notices never reached the different estates. Owing to collusion amongst the native officers of the Government, the notices in many cases did not go out; and the consequence was that when the day for payment arrived, the estate was put up for sale and knocked down generally to some creature of the court who, in a fictitious name, bought it in for himself; he dare not insert his own name in the register, but he fictitiously bought it in. The result of this was that a very large portion, perhaps a fourth of the estates during the first 12 or 14 years of our occupation, changed hands; that is to say, that auction purchasers took the place of the old village communities. The communities were extremely exasperated, the first notice they generally had of the sales was the auction purchaser coming to take possession. It resulted often in the murder of the auction purchaser or the murder of the agent, whom he deputed, and the burning of his houses and whatever property he might have. The Government at this time were in ignorance of what they had done: they were not aware that their system had brought this to pass; but it gradually began to dawn upon them that a great injustice had been committed, and a special regulation was framed in 1821 giving powers to a commission to examine into all the sales that had taken place; and where it was proved that any fraud had been used, or that any notice had not reached the people, or that they were in complete ignorance of what had taken place, the commission was ordered to restore the estate.

1575. *Mr. J. B. Smith.*] The person to whom the estate was restored paid back again the money, I suppose?—Yes. This commission, which was framed with the best intentions, did not work on the whole as satisfactorily as could be expected; the distances the people had to go were great, and the expenses considerable; but I may say that the result was that about half the estates which had been sold were restored to the village proprietors, the auction purchasers, of course, getting back the sum they had paid, and, perhaps, in some cases, interest, but I am not quite sure about that. The Government then gradually became alive to the fact that they were really working in the dark; that they did not know, or had not a full acquaintance with the state of landed property generally, and commissioners were sent by the Government of India to visit each district.

1576. *Chairman.*] Before you go further, can

you tell us at all what was the price that was obtained on those auction sales; how many years' purchase?—Very often little more than the balance due on the estate; it was sold for a mere trifle.

1577. That would be some portion of the year's revenue?—Yes, some portion of the year's revenue; very little more.

1578. At that time, with the heavy assessment which you have mentioned, had proprietary rights any marketable value in the district?—I should think not; it was not the custom to sell.

1579. Will you please go on to describe what the Government Commission did?—A commission was appointed, and a commission visited every district, and reported to the Government that things were in a very backward state generally, and that a good deal of injustice had been done, owing to the sales that had taken place; and they collected a great deal of information regarding the proprietary rights, and the custom of the people generally; and a regulation was framed in 1822, the author of which was Mr. Holt Mackenzie, a very great authority, who himself had not much practical experience of the actual details of revenue work, but who had studied the whole system; he prepared a draft of an admirable regulation (Regulation 7 of 1822), which was to be the basis of all future settlements. Briefly, I may say that this regulation laid down that the boundary of every village was to be marked off. The rights of all proprietors, the rights of all cultivators claiming any special rights to be determined, the nature of the soil, the rent, and everything was to be gone into, and, in fact, the regulation went to the opposite extreme of what had been done before. The defect of the regulation was this, that it imposed on limited agency unlimited duties. The investigations ordered were so minute that, at the end of 10 years from 1822, very few estates had been settled, and, at the rate that they were going on, it was considered that it would take 60 or 100 years to complete the settlement of the North Western Provinces.

1580. With the staff that was then employed?—The staff was small, and the investigations were very numerous. The regulation required, amongst other things, that every right for the past 60 years should be inquired into, so that there was an amount of work thrown upon the revenue officers, which it was quite impossible for them to carry out.

1581. It was an inquiry into land tenure, as well as into revenue settlement?—Yes. Lord William Bentinck, in 1833, finding that the settlement was progressing so very slowly, assembled a conclave of officers at Allahabad, and a new law was issued, called Regulation 9 of 1833. In it, while keeping in view all that Regulation 7 of 1822 had laid down, the future arrangement was simplified very much by laying down the rule, that possession only was to be looked to by the revenue officers; that they were not to go into old rights at all, but possession was to be the basis of the settlement, leaving all who had any further claims to go to a civil court.

1582. That is to say, the possessor was to represent the owner for the purposes of the settlement?—Yes, for the purposes of the settlement, leaving

Sir R.
Montgomery,

G.C.S.I.

21 April
1870.

Sir R. leaving all who had further claims to go to the
Montgomery, civil court.

K.C.B., 1583. Claims against the possessor?—Yes,
G.C.S.I. against the possessor, or amongst themselves if
they were fighting about shares; they were to go
to the civil court, the revenue officer having only
21 April to find out who was actually in possession at
1871. that time of the shares or land.

1584. That is to say as between Government and the possessor, the Government treated him as the owner of the property, leaving any person who claimed an adverse right to him to assert it in a court of justice?—Yes; at the same time the Government increased the staff of settlement officers, their object being to carry out nearly simultaneously in every district the settlement of the land revenue; and at that time the junior member of the Board of Revenue was Mr. Robert Mertins Bird, a man of great grasp, great energy, and great experience; and in 10 years he carried out, I may say, the completion of the settlement of the North Western Provinces; that is to say, he retired from the service at the end of 1842, and before he went he considered that he had completed the settlement. There were certain details to be carried out afterwards, and certain arrangements to be made which, fortunately for the North Western Provinces, fell into the hands of Mr. Thomason, another very distinguished officer, who subsequently became lieutenant governor of the provinces.

1585. You have not stated for what period this settlement was to last?—The settlement was for 20 years; and the record, I may say, was one that any Government might be proud of, it was very complete in every statistical detail. The villages were mapped, the proprietors' rights were recorded, and any special rights that cultivators might have, were all entered; and the indirect benefit, if I may so say, was this, that a body of Government officers were raised up thoroughly acquainted with the whole tenures of the country, the best preparation for judicial work; and they also learnt this further, that to be successful with administration in India, it is necessary that the officers should live amongst the people, as a settlement officer is obliged to do for months and months every year, so as to sympathise with them, and to enter into all their feelings.

1586. Will you also state what was the general effect of that settlement as regards the assessment of the revenue as compared with the amounts that were previously paid?—I think I have a return here to show that. The first return which I have is 1811-12; that settlement yielded 2,722,487*l*.

1587. Would that represent the assessment under the system of the native rule?—Well, 1811-12 was several years subsequently. I daresay, under the native rule, it must have approximated to that. I do not think it was more than it was under the native rule; the probability is that it was rather less, because our Government did not take so much, I think, as the native ruler. But the first return that we have is for 1811-12, and that was what I have mentioned. From that period quinquennial settlements were ordered. From 1812-13 to 1816-17 it was 3,042,610*l*.

1588. Do you suppose that that was on the same area?—I think it must have been on an in-

creased area, because Kumaon and the Phoon districts were added, so that it was rather an enlarged area.

1589. Was there much cultivated land in those districts which were then acquired?—No, comparatively not much. From 1817-18 to 1821-22 the revenue was 3,313,052*l*. There was a considerable increase, but Bundelcund came in. In 1826-27 it was 3,333,280*l*; that is much the same. In 1831-32 it was 3,249,981*l*; there is a decrease. In 1836-37 it was 3,303,166*l*; there again there is a small increase. In 1841-42 it was 3,142,235*l*; and when Mr. Bird's settlement was completed, namely in 1846-47, it was 3,547,132*l*; there is a considerable increase there; about half a million.

1590. Was there any increase of area at that time?—Not at that time. But although the increase was only half a million after the very close investigation that had taken place, an immense change was made in the assessments of the different estates. It was found that under the old local governments some estates were very highly assessed; that is to say, industrious cultivating communities paid a much higher assessment than others who were not so industrious, and who, perhaps, had some interest at Court, or in some way or other managed to get off; and in this settlement of Mr. Bird's the whole was re-distributed much more equally, and there was an increase of something approaching half a million of money.

1591. But without some further explanation from you, it would seem that the rate of assessment would have been as heavy after the settlement of Mr. Bird as it was originally under the native governments?—You must remember that an immense quantity of ground was brought into cultivation during the previous 30 years, and a great many rent-free tenures fell in, and all that tended to swell the rental.

1592. As a general proposition, may we assume that the North West Provinces had been very much ravaged and unsettled immediately before the British Government acquired them, and that they enjoyed 30 years of profound peace and tranquillity subsequently?—That is the case.

1593. Would that to a large extent account for the increased power of paying the assessment, whilst the rate was not diminished?—I do not know that the rate was higher, but the quantity under cultivation was so much greater that the Government of course got a much larger revenue.

1594. I am endeavouring to elicit the result of the settlement as regards the proprietary interests; what was the value of the proprietary interest left after taking the revenue under Mr. Bird's settlement?—Under Mr. Bird's settlement the amount the Government took was two-thirds of the net assets.

1595. Therefore it would be 66 per cent., leaving 33 per cent. to the occupant or the owner?—Yes, to the owner.

1596. Was that accepted by the people at that time as a reasonable settlement?—It was generally accepted as a reasonable settlement; and the best proof of that is that the communities and country generally have prospered very much under it.

1597. In examining into the state of the tenure, what was the general result as regards the

the ownership and occupation; was it found that many people claimed to be owners who were mere tenants from year to year, or were they occupants generally claiming to be also owners without having any landlord: were the occupants generally found to claim to be owners so as not to have any intermediate landlord between themselves and the Government, or was it ascertained, in the examination of the land tenures, that there were many persons who were intermediate landlords?—Generally speaking, the mass of the villages are held by proprietary communities, who cultivate a certain portion of the village, and the rest is cultivated by cultivators without right of property.

1598. Who are tenants from year to year under the proprietary body of the village?—Yes.

1599. But apart from that, were there many other persons recognised as owners of the property cultivating through their tenants from year to year?—In every village there were a few persons who had some special rights who were termed cultivators, but either perhaps from relationship to the proprietor, though not proprietors themselves, or from being Brahmins, or from performing religious duties, or for some favour shown to them, held uninterruptedly their lands at fixed rates; but they were not numerous, although in almost every village a few were to be found.

1600. What was done in this settlement with the uncultivated lands, that is to say, the untilled lands, the natural pasture and the unoccupied land?—The untilled land culturable was left to the proprietors to break up during the period of settlement of 20 years.

1601. But were they to pay any additional assessment if they broke it up, or was it profit to them?—Entirely profit to them, the Government contemplating that at the end of the 20 years' term they would again be able to renew the assessment of the village, and if necessary to take an increase.

1602. What was done with the untillable land, that is to say the natural pasture?—It remained at the disposal of the villagers, Government took nothing.

1603. That they had the liberty of using in common for pasturage, or according to their particular rights?—During the periodical rains grass grows on those extensive barren plains, and they are used for pasturage; cattle roam about and pick up grass, but they are not culturable.

1604. But is any land revenue derived from that?—No, not in the north-west.

1605. Can you state what the result of the investigation was as to the proportion of land capable of tillage, and the natural pasture or useless land?—Yes; the cultivated area was 51 per cent.

1606. Are you speaking now of the present state of the North Western Provinces?—Yes; by the latest returns, 51 per cent. was the cultivated area, 15 per cent. culturable, 9 per cent. rent free, on which no assessment has been placed, and 23 per cent. barren waste. In the North Western Provinces there are very large plains, covered with a kind of white efflorescence of soda, which we have never yet been able to bring into cultivation; if anything could be devised to bring the land so covered into cultivation.

a large revenue might be expected, but at present they have not succeeded in that.

1607. Does the per centage of rent-free lands represent the lands that were held under grants of the specific character which were defined in the regulation, and recognised as grants free from land tax?—Yes.

1608. Perhaps it would be convenient if you were to go on now to state, from the period at which we stopped, what has been done with reference to the districts that have been acquired since Mr. Bird's settlement took place; I think you were going on to describe a revision of Mr. Bird's settlement?—What I was going to say with reference to that was: one of the great advantages of raising up this body of officers thoroughly acquainted with the whole revenue system was, that when Lord Dalhousie annexed the Punjaub he selected the officers for that country from the North Western Provinces, and they did not fall into the same errors and mistakes as were originally made in the north-west.

1609. What took place when the revenue administration came under Mr. Thomason?—After Mr. Bird left, Mr. Thomason took up the Government control, and completed any details that had been left unfinished by Mr. Bird; and he also prepared numerous compendious treatises, laying down rules for the future guidance of revenue officers in every possible case that could come forward.

1610. Will you state what has been done with reference to the provinces that have been acquired since the period you mentioned of Mr. Bird's settlement being completed?—The additions have not been great. They have been settled on the same principles.

1611. Were the provinces that were taken from Bengal settled under the Bengal system?—They remained as they were, and no change was made in them, the land revenue being settled in perpetuity. Mr. Bird's settlement was concluded in 1846-47 for 20 years, and the leases began to fall in about 1862 or 1863, and since then the whole north-west has again been undergoing a revision of settlements, on the same principles on which they were originally formed, but with this difference, that the proportion that the Government now take, instead of being two-thirds is only one-half. It was found, on the whole, that the two-thirds was rather more than they could perhaps very easily pay, and the Government, after great consideration, decided that it would be quite sufficient to take half the assets; they thought that the proprietary communities would flourish more; that on the whole they would be much easier and more prosperous, and they willingly agreed to take only 50 per cent. and 5 per cent. for expenses.

1612. What was the effect of the re-settlement on the amount of the land revenue?—It is not yet completed.

1613. As far as it has gone, what has been the general result?—Generally speaking there has been an increase; in some districts a very large increase; I may mention, for instance, Goruckpore. Goruckpore was a tract of country that was not highly cultivated when we received it, and in Mr. Bird's settlement it was found that if the Government had chosen they might in many cases have quadrupled, and more than quadrupled, the old assessment; that is in the

1871.

year 1846-47; but it was not considered politic to enhance the assessment too rapidly, and therefore, in Mr. Bird's settlement, although a large increase was taken from Goruckpore, the assessment was very light per acre compared with assessments in other parts of the country. Now that we are again revising the assessment, I learn we have got an increase of about 80,000*l.* from the Goruckpore district.

1614. What was the total formerly of the Goruckpore district?—In 1864, A.D., the district was found so large that it was converted into two districts, viz., Goruckpore and Bustee. It was about 240,000,000*l.*, and they have got about 80,000*l.* increase from that Goruckpore district, and even that by acreage is much less than any other part of the North Western Provinces; so that it is to be hoped that in a future revision there will be another very large increase. There is one thing that I should mention, which is very important with regard to the present settlement: by orders from Her Majesty's Government, it has been determined that in all villages in the North Western Provinces where the area of the estates under cultivation amounts to 80 per cent. of the total cultivable area, they are to be settled in perpetuity; there is one proviso that no permanent settlement is to be made in any estate to which canal irrigation may be extended within the next 20 years, and the existing assets of which would thereby be increased in the proportion of 20 per cent. We have no record as yet how far this has been carried out, because no reports have come from India, but I doubt not myself but that under these orders many assessments will become perpetual in the north-west, because the estates in a great many cases have been cultivated up to almost the extreme point.

1615. Has that actually been put in operation yet; have any grants been made in perpetuity?—It has been put in operation, but we do not know to what extent it has gone.

1616. Mr. J. B. Smith.] In what part is it put in operation?—In ten districts a revision of the settlement is in progress. I mean the second revision; the settlements are at this present moment undergoing revision.

1617. *Chairman.*] Has any act of the Legislative Council been passed to give effect to the directions of the Government at home?—No, the orders of the Secretary of State suffice.

1618. But is it supposed now in India that the orders of the Secretary of State can limit the legislative power of the Government of India?—The order, at any rate, is not called in question by the Government of India. The orders to which I refer reached in Lord Lawrence's time, and he himself, I think, was rather in favour of the plan of having a permanent settlement where estates had been cultivated up to a certain point, and he very readily carried out the orders of the Secretary of State.

1619. This is a declaration that the legislative power in India shall not levy any tax upon the land, is it not?—I do not think that that would touch the question of the land revenue.

1620. You consider that this then is without prejudice to the legislative power of the Government to levy any tax it thinks fit on land?—The order for a permanent settlement is supposed of course to be a great relief to the people, instead of having a revision of settlement every 20

or 30 years, they should have it permanent; it was supposed that the Government themselves were giving up a great deal.

1621. What I was endeavouring to ask was, whether there being now two authorities in India, one the Executive Government and the other the Legislative Government, the Executive Government in India is still considered to have the power of restraining and preventing the legislative power in India by its own acts, and not in the Legislative Council?—That is a question that perhaps is not very clearly defined yet. It has never arisen, that I am aware.

1622. Has any provision in this new arrangement been made for the right of the Legislative Council, at all events to levy special rates?—The assessment is a matter that would not come before the Legislative Council; the Executive Government would decide, and whatever arrangement they thought necessary with regard to the land revenue, it would not come before the Legislative Council; they, as an executive government, would carry it out.

1623. But is any explanation made to the people in any way that that is done without prejudice to the powers of the Legislative Council?—I do not think so.

1624. Are you aware that in the Bombay code there is an express declaration that whatever is done under that is without prejudice to the power of Government in its legislative capacity to levy any additional taxes it thinks right?—No; I am not aware of that.

1625. At present there are those two conflicting claims, the Executive Government claiming to declare that the land shall not be subject to any charge, except a specific charge which they fix, and the Legislative Council claiming the right to impose taxes upon the land for any purpose which it thinks fit; is not that so?—It is not the case in the North Western Provinces, which we are now speaking of.

1626. Has not the Legislative Council power to legislate for the North Western Provinces?—Yes, but it is usual to complete the executive operation, and then to confirm the contract made by an Act of the Legislature.

1627. Do you consider that it has no power to levy a tax for the purpose of making roads or any other purpose?—I think they could.

1628. You consider that if it is a tax levied for any specific purpose other than the general revenues of India, it could do so?—It could certainly impose any specific tax for the local management of the country, such as roads and bridges and so on, and schools.

1629. With regard to the unsettled territory, is there not a considerable area in the North Western Provinces that is at present unsettled, and that is of great value?—All the land is included in estates. Whatever cultivable land is included in those estates remains for the benefit of the proprietors till the conclusion of the period of settlement. I am not aware of any large tracts of country of that character, except perhaps under the hills, called the Terai, and also under the hills in the Goruckpore district. There are large extents of forest, and those I think have been separated off, and some of them given to grantees on certain conditions. I am not sure to what extent that has gone.

1630. Are there any special steps being taken now to encourage the cultivation of lands that are

are not at present cultivated?—No, no special steps further than canal irrigation.

1631. But are you aware that some time since rules were made for selling the uncultivated lands in India?—Yes, I have heard of them.

1632. Do you know what has been done under those rules in the North Western Provinces?—Very little has been sold there. I saw a return of last year, and the quantity sold only amounts to 1,200 L., and the year before, I think, it amounted to 2,000 L.

1633. Is there any cultivation of tea or other produce on the hill sides?—In the Kumaon and Dehra Dhoon Province there is a great deal of tea cultivation; the Government have got two tea gardens and independent persons have got gardens; and I think that they have been on the whole fairly successful. The Government undertook their plantations more to introduce the tea into the country than for any other reason. In the Punjab, where they did the same thing, as soon as they had introduced it they sold their tea estates, and I suppose they will do the same in Kumaon now.

1634. Would those estates be subject to land assessment or would they be exempt?—They would bear the land assessment, whatever land assessment was put upon them, the same assessment as was put upon any other produce. They would not assess the estates higher because tea was grown on them.

1635. Do you attribute much of the rise of the value of the assessment to the increased money value of produce?—Certainly.

1636. As well as to the increased cultivation?—Yes; the money value of produce is rising very much; the estates are becoming every year much more valuable.

1637. Can you give us any idea, in a general way, how much would be due to the increased rise of prices, and how much to the increase of cultivation in the last re-settlement?—It would be quite a surmise; but I should think certainly 25 per cent.

1638. Assuming the whole rise to represent 100, then what proportion of that 100 would be due to the increased rise of prices, and what proportion to the increased cultivation?—Perhaps about half to cultivation and half to increase of prices. That is a mere surmise, but I should think that would be about it.

1639. You have parted with a portion of the North Western Provinces to the Punjab?—Yes; the Delhi territory.

1640. What would be the value of that portion?—About 360,000 L.

1641. What I am anxious to get from you is, what would be the real money value of the increase in the assessment on the last settlement?—You must bear in mind that the assessment has not yet been completed.

1642. As far as it has gone, that would be the increase?—I have no return to show the total assessment of the districts now under revision, but there is a return showing that in five districts completed the increase has been 110,000 L.

1643. But upon what figures is that increase?—I have not got the figures; in four others 80,000 L. is anticipated; I have not got the details of the districts.

1644. But observe this, taking a general view you have stated that the rate of assessment has been reduced from two-thirds to a half?—Yes.

0.59.

1645. You have also informed us that the previous gross return was 3,600,000 L.?—Yes, about that.

1646. Then you will observe that upwards of 300,000 L. has been withdrawn from the North Western Provinces?—Yes.

1647. And the present assessment is 4,000,000 L.?—Yes.

1648. Therefore the total, if you add that which has been withdrawn, would amount to 4,300,000 L., as compared with 3,600,000 L.; that would be an increase of 700,000 L.?—Yes. It is necessary to explain that the assessments noted up to the end of 1846-47 alluded only to those made by Mr. Bird, who only settled four and a half out of eight divisions. The following will show the correct statement:—

	£.
Revenue settlements concluded by Mr. Bird 1846-47	3,317,000
Add, Benares, permanently settled districts - -	400,000
Add, Shaasi division, three districts lately annexed -	221,000
Add, Kumaon Hill Districts (non-regulation) - -	198,000
Add, Amere, lately annexed - - - -	37,000
	<hr/> 4,166,000
Deduct Delhi division, transferred to Punjab in 1858	365,000
	<hr/> Balance - - - £.
	4,101,000
Assessment of 1858-59, as in Parliamentary Return	4,089,889
Difference - - - £.	<hr/> 12,111

The increase of revenue by present revision, though collected, is not credited to land revenue till sanctioned by the Government.

1649. Then on the other hand there has been a diminution of ratio from two-thirds to a half, and that would show therefore that the actual increase of value in the assessment (not speaking now of the increased amount) is a million and a half?—A great deal of ground has been brought into cultivation.

1650. But the increase in value would amount to a million and a half a year?—Yes, I should think it would.

1651. Do you think, having regard to this increase of value, that it is desirable to fix the assessment in perpetuity?—No, I do not think so; I think it is a great loss to the Government.

1652. If the rise in prices should go on, and the other 20 per cent. of cultivation, which was the margin left, should be taken up, in the next 20 years, the result would be a loss of a million a year to the revenue without altering the rate of charge?—I could not say, but I think it is a great error in the Government to fix the assessment in perpetuity. A lease of 30 years is quite sufficient; and if we fix the assessment for ever, with our expenses going on increasing, we shall be compelled to make up our deficit by putting on novel and unpopular taxes.

1653. Sir C. Wingfield.] You omitted, I think, in describing the settlement of the North Western Provinces under Mr. Bird, to refer to a question which was the subject of very great contention at that time, and that was the treatment of the great landed proprietors known as talookdars in the North Western Provinces. You say that the Government dealt with the party in possession as regards the assessment of the land, leaving disappointed claimants to sue in the civil court. That of course was a simple matter enough when there were only two parties

claiming

claiming the land, one party in possession, and one party not; but where, as in the case of a superior and an inferior proprietor, there were two interests actually in possession at the same time of the same land, then by the Regulation 7 of 1822, the collector was empowered to decide which of these two parties the Government should admit to engagements; is not that so?—Yes.

1654. Then this great question arose, as to who had the best title to engage with the Government, the talookdar or superior, or the village occupants?—Yes.

1655. There were two great parties among our officials at that time; one maintained the rights of the superior interest, and the other those of the village occupants?—Yes.

1656. The result, I think, was, that the superiors were very generally excluded?—That is the case; and I may say that if I did not mention that before, it was because these talookdars formed a minority in the country, and I was describing generally what was the state of things at the time the provinces were ceded.

1657. In many districts these talookdars owned a great portion of the land, did they not?—They did.

1658. Many of their estates were very extensive?—They were.

1659. At that time I think a reaction had set in against the permanent settlement of Bengal with zemindars, and that feeling was extended towards great proprietors in general?—I think so.

1660. And the result was that many officials were prejudiced against these great proprietors?—I think so.

1661. And considerable injustice was done to many?—I think so.

1662. The idea then was, that a talookdar was little more than the channel through whom the Government revenue was paid, and that the real proprietors were to be found among the village occupants?—In reply to that I would say, generally, yes; but there were two classes of talookdars; one class had a much more permanent interest in the land than the other.

1663. I agree entirely in what you mean, which is, is it not, that those talookdars who really were the representatives of ancient proprietary families, suffered because many of their class were creatures of misgovernment, and, in fact, were originally nothing but farmers, or collectors of the land revenue for tracts of the country.

1664. But with regard to those ancient hereditary talookdars, who were chiefs of clans, and others, they suffered?—Yes.

1665. And in many cases their undoubted proprietary rights in the villages were set aside, were they not?—I should say that was the case.

1666. And that the rights of village occupants, who may have had, perhaps, in remote times, a proprietary origin, but whose proprietary rights, however, had become extinguished by time, were resuscitated, and they were replaced in possession?—They were.

1667. You recollect that Mr. Boulderson, a member of the Board of Revenue, strongly denounced the proceedings of the settlement officers in regard to these great proprietors?—Yes.

1668. He made use of this expression: "The process actually followed has been the simple one of setting aside the talookdar as one who could have no proprietary right; to regard him as the usurper of others' rights, and at once to depose him; hundreds of estates have been transferred from the holders of them for centuries to their tenants." That may be a little too strong, but there is a basis of truth in it, is there not?—There is, certainly.

1669. These excluded talookdars were, of course, at liberty to bring suits in the civil court to set aside the decisions of the settlement officers?—They were.

1670. But, practically, they entered upon these suits at great disadvantage, did they not, because the orders of the settlement officers, admitting the occupants to engage, were carried out at once, and, therefore, these men entered upon litigation stripped of half their properties?—That was the case; but in several instances they succeeded in getting back their rights.

1671. They did; but I think that in the great majority they failed to do so?—Yes.

1672. You, I dare say, recollect instances where many great proprietors lost the great bulk of their estates?—Yes, I know instances where these talookdars lost the great bulk of their property, and became a kind of pensioners. The Government set them aside; an assessment was made with the village communities, and they got a per-centage.

1673. They got, if I recollect right, 18 rupees out of every 33 rupees of the proprietary profits set aside by the Government?—Yes.

1674. But that was only to last during the period of the settlement?—Yes, and to be reconsidered at the end of the time.

1675. And I think the orders of the Court of Directors were, that 10 per cent. should be given afterwards?—I am not sure the exact sum that was laid down, but it was to be reconsidered afterwards, and to be reduced.

1676. And when you went to Oude, you were impressed with a sense of the injustice that had been done to the talookdars of the North Western Provinces, and you determined not to see the same injustice done to them in Oude?—I was much impressed with that; and there was a very strong proof that the Government of India, in having set aside the talookdars, had fallen into great error, because when the mutiny took place, and our officers were obliged to withdraw, they went for protection to the houses of these very talookdars whom we had set aside, and, during the time they were there, they saw the village communities coming and tendering their allegiance to their talookdar, and saying, "You are our owner, you are our master, and we range ourselves under your standard." That is a very strong proof that they did not value the arrangements which had been made by our Government, but preferred being under their own talookdars.

1677. You think that in the settlement of the North Western Provinces there was too violent a disruption of these associations, which had bound the feudal chief with the tenantry?—I think so. I think there was a general levelling of rights; the great desire, I think, seemed to be the greatest happiness of the greatest number.

1678. I think shortly after we acquired the ceded

ceded and conquered provinces which comprise the bulk of the North Western Provinces, the Government intended to make a permanent settlement?—They did.

1679. And in fact they passed a regulation ordering the permanent settlement to be carried out in those Provinces?—They issued that order which I omitted to have mentioned before. Lord Wellesley was Governor General; he was very anxious that the permanent settlement should be made the same as in Bengal, and he issued a proclamation that the settlement would be permanent; but of course it would require to be sanctioned by the Court of Directors. The old Court of Directors, when they heard of this proclamation wrote out in the strongest terms deprecating the settlement being made permanent, and stating that a great mistake had been made in Bengal; that the country was not nearly in the full state of cultivation, or prepared for a permanent settlement, and that on no account was a permanent settlement to be sanctioned without their concurrence.

1680. The measure was finally negatived in a Despatch by the Board of Control in 1817, was it not?—Yes, by Regulation 9 of 1812.

1681. Then at the time of the settlement of the North Western Provinces, besides fixing the proprietary rights, a record was drawn up of cultivators; that is to say, of the cultivators under the proprietors possessing rights of occupancy and of those without rights of occupancy?—Yes, there was.

1682. And the distinction, I think, was laid down, and the rule was, that men who had been in occupation for 12 years or something about that period were recorded as possessing rights of occupancy, and the others were recorded as being tenants-at-will?—Yes, that was the case; an arbitrary line was drawn; all who had been 12 years in possession were recorded as having rights of occupancy, and those who had not been so long in possession were put down as ordinary cultivators.

1683. Do not you think that that was a distinction which was entirely an arbitrary one introduced by ourselves?—I think it was quite arbitrary.

1684. The natives never drew that distinction at all?—Never.

1685. The only distinction they ever drew between the different classes of cultivators not claiming proprietary rights was between those who were resident in the village, and had been long resident in the village, and those who were non-resident, but came from adjoining villages to cultivate?—That was the general distinction.

1686. But in the treatment of the two classes they made no difference whatever?—I think not.

1687. The fact is that at that time the want was of cultivators; a cultivator was too valuable a person to be ill used?—Yes.

1688. It is only since the population has increased and land become very scarce that any contention between cultivators and peasant proprietors has grown up?—Generally, I should say so.

1689. In the district of Goruckpore you mentioned a great increase of the land revenue. It is a curious circumstance that this is the district that has given a very great increase, and in this

district there are 20 miles of a small canal, and there are not 100 miles of metal road; so that all this increase has simply been owing to the circumstance that there was an immense amount of waste land which has been brought under cultivation?—That is the case; and beautiful soil and water close to the surface generally.

1690. Mr. *Fawcett*.] Natural water?—Yes.

1691. Sir *C. Wingfield*.] I gather from a reply which you gave to the Chairman that you are opposed to the principle of a permanent settlement; that is to say, to the Government tying up its hands and precluding itself from all future increase of the value of the land revenue?—I feel sure myself that it is a great error.

1692. Especially at a time when we are spending, or may spend, some 200,000,000 £. in railways, canals, and in other works which must enormously develop the productive power of the land?—I quite agree in thinking that it is a great error.

1693. Mr. *Beach*.] In the case where land is free from land tax it would be considered almost a breach of covenant on the part of the Government to impose anything except a mere cess for local purposes, would it not?—It would be quite a breach of faith; it could not be done; Government would never think of doing it.

1694. It is only about 9 per cent., I think you stated, of the land which is rent free?—Yes.

1695. Is the term of 30 years a satisfactory one generally to the cultivators?—I think it is quite satisfactory; the people are well satisfied with a 30 years' lease.

1696. In case of any smaller term I presume there would generally be a bar to improvement from the expectation of a fresh revision taking place?—It would be so to a certain extent, certainly; the longer lease would, I think, enable them to improve their land and derive the benefit from it.

1697. Do you think that where the 30 years' leases have been granted, there is a general disposition to improve the land?—Certainly.

1698. What is the general size of the small tenancies to which you have referred?—I think about four acres in the North Western Provinces; that is about the amount of each cultivator's holding.

1699. Where the amount was received for the redemption of the land revenue or for waste land sold, it went to the financial purposes of the year, did it not?—I think in the North Western Provinces hardly any land has been sold.

1700. A little waste land, you said, had been sold?—Yes; but I do not know what was done with the money. It was a very small sum, and I have no record of what was done with the money.

1701. Sir *D. Wedderburn*.] I suppose that, owing to the security afforded by our Government, there has been a very complete change in the relations between the great talookdars and the cultivators, from the increase of population and the consequent competition for holdings?—Yes, I think so.

1702. Then would not that render it necessary for the Government in its general policy to take a more favourable view of the case of the ryots where differences arose between the two classes, because

Sir *R. Montgomery*,

1871.

because every year the position of the ryots with respect to the talookdars became less favourable?—In what way, may I ask?

1703. That instead of being bribed almost to come from one part of the country to another, they have now to subject themselves to far less favourable conditions in order to obtain a farm or a holding, and therefore they are somewhat like the Irish tenants, in a much less favourable condition than they were when the country was less settled and less prosperous?—I do not know that has gone to any great extent yet; it may be more the case hereafter, but at present there is still a margin left.

1704. Mr. *Fawcett*.] I understood you that about 10 per cent. of the whole land in the North West now is subject to this permanent settlement?—I did not say that.

1705. What portion has been subject to it?—We have no return yet of the new operation.

1706. Can you give any estimate?—No; we have no return of any kind from India showing to what extent the leave to introduce the permanent settlement has yet gone.

1707. Is more land each year in the North West being brought under the permanent settlement; is the practice of bringing land under the permanent settlement still going on from year to year?—So far as the orders issued by the Secretary of State, that when 80 per cent. of the culturable land is cultivated, there shall be a permanent settlement, it certainly is going on.

1708. And that order is still in existence?—Yes.

1709. Such a record as I have asked for could be obtained, I suppose?—It is not in the India Office here.

1710. Could it be got from India?—Yes.

1711. When was that order issued?—In 1862.

1712. Who was then Secretary of State for India?—Sir Charles Wood.

1713. Am I to understand then that an order issued from the India Office like that is not subject in any way to the control of the Legislative Council?—In no way.

1714. The Legislative Council is the only assembly in which the people of India are at all represented, is it not?—The only one.

1715. Therefore, with regard to an important order like that affecting the revenue of India, you may generally say that the people of India have no voice?—They have no voice.

1716. You estimate the loss of revenue in a few years, from this permanent settlement, to be over a million?—No.

1717. I mean that the possible increase might be over a million?—We have no data to form an opinion, but judging from Goruckpore might be a quarter of a million.

1718. As far as I understand you, you condemn, in the most unequivocal way, the permanent settlement?—Yes.

1719. You would agree, in fact, with all the condemnation expressed of it by the President of the Board of Control in 1817?—I have not read the order issued then, but I certainly should agree in thinking that it is a mistake.

1720. Then, speaking generally, we are repeating in the North West the blunder committed

by Lord Cornwallis in 1793?—There is this difference: that when Lord Cornwallis made his perpetual settlement in Bengal we were perfectly ignorant of the state of the country, of the state of the cultivation, of the state of the rights of the proprietors, cultivators, and so on. Now we have a full knowledge of everything connected with the details of the estates, and we have laid down the rule that only under certain conditions shall a permanent settlement be made; and cultivation is in a more advanced state.

1721. Then I understand you that Lord Cornwallis blundered, and may be excused for his blunder, because he had no experience to guide him; but that the India Office in 1862 blundered, having the experience of 60 years to guide them?—I never permitted myself to say that the India Office blundered; but as a private individual, I think it was an error. There are a great many authorities, amongst others, Lord Lawrence, who is a great authority, who are in favour of this permanent settlement, and opinions are much divided about it. My own individual opinion is, that it is a mistake; but on the other hand, a great many men, who are excellent judges, consider that it is a politic thing.

1722. According to your own experience it was a blunder?—I have already given my opinion.

1723. Do the cultivators, who are affected by the permanent settlement, pay the revenue direct to the Government, or does the Government obtain it from any intermediate persons?—There has been no permanent settlement yet completed in the North West, except the Benares districts, although leave has been given that under certain conditions there may be a permanent settlement.

1724. Then this order which permits that a permanent settlement may be introduced applies to the whole of India?—Yes, in the Presidency of Fort William.

1725. One of your objections, of course, to the permanent settlement, is that from your experience of India, you observe that a rapid and continual rise of prices is going on, and that being the case, the Government revenue gradually becomes less valuable?—Yes.

1726. And the greater the rise in price the more disastrous is the permanent settlement?—Yes.

1727. In Bengal, owing to the great rise in value of land, and in the increase of prices, we only now get, do we not, about one-fourth of the revenue which we might have got from the land if it had not been permanently settled?—I believe that has been the estimate; but I think that there is no very certain basis to go on. There is no doubt, however, that we do not get anything like what we would have got under other circumstances.

1728. You have said that one result of that permanent settlement would be, that we should gradually lose the land revenue, and should have in place of that land revenue to levy taxes onerous and vexatious to the people of India?—I think so.

1729. Have any such taxes as those been lately levied in the North Western Provinces in consequence of the financial exigencies of the Government?—I think in the North Western Provinces the landholders have not yet been touched.

reached further than the new settlement now being made. Supposing the net assets of an estate to be 1,000 rupees, the value of the land revenue will be 500 rupees. Half per cent. is put on for the road fund, which is five rupees; half per cent. for the school fund, which is five rupees; one-eighth per cent. for the postal department, which is one rupee four annas; and three seven-eighths for municipal purposes, that is, to police, town improvements, and sanitary purposes. Altogether 550 rupees are taken, and that is taken from the landholder, but nothing beyond that.

1730. I was not referring so particularly to taxes falling on land, but I understood you that the financial exigencies of the Government were gradually becoming such, that besides raising a revenue from land, they would have to raise novel and vexatious taxes; could you enumerate any such taxes?—It is now under contemplation to raise them, but nothing is yet decided.

1731. Could you mention any such taxes now in contemplation?—I think they talk of a license tax; they talk of a tax on marriages, and they talk of a wheel tax.

1732. That wheel tax is to tax a carriage in proportion to the number of its wheels, I suppose?—Yes.

1733. And those taxes are necessitated, you think, to a considerable extent, by the sacrifice of revenue in consequence of the permanent settlement?—No; the permanent settlement not yet having come into operation, and we not knowing to what extent it may come into operation, these taxes have nothing to do with the permanent settlement, but the Government are requiring certain extra things done now, and they consider that the inhabitants should be rated to make up the deficiency.

1734. Do you think that such taxes as those which you have just mentioned are ill suited to the habits of the people of India, and would be extremely vexatious?—I think that probably a great deal would depend upon how it was done, and whether the natives were taken into consultation or not. If it was done with a high hand, without consulting them in any way, I think it would probably in many ways be very unpopular; but if the natives were taken into consultation, I have no doubt myself that there are several ways in which they might suggest that taxation might be levied, and which would not be so distasteful to them.

1735. But as I understand you with reference to any arrangements affecting revenue, they are not consulted at all now, because an edict is sent out from Westminster or from the India Office?—They are not consulted at all; but the order emanating from the Home Government has been in favour of the people.

1736. A question was asked you by the honourable Member for Hampshire with regard to the proceeds of the sales of waste land; you say that they are small; but could you, next time you give evidence, furnish us with any account showing whether those proceeds of sale have been devoted to revenue or to capital?—I have no doubt that I could ascertain that.

1737. Have the proprietary rights of the Government in these forest lands, the Terai lands under the hills, been sold, or the right to levy the revenue?—The proprietary rights have been

sold in some instances, including the claim of Government revenue on the land.

1738. You will furnish us next time with the manner in which the proceeds of those sales have been appropriated?—It can easily be ascertained.

1739. Mr. J. B. Smith.] Am I correct in supposing that the first settlement in the North Western Provinces was for 20 years?—Yes; Mr. Bird's settlement was for 20 years, or till the new settlement.

1740. But that the present settlement is to be for 30 years?—The orders of the Home Government are to make a perpetual settlement under certain conditions, otherwise the settlement is for 30 years.

1741. Has any arrangement been made to protect the rights of the ryots in cases where it has been decided that the land belonged to the talookdars; that the talookdars shall not charge beyond a certain rent?—Yes; or I might say, more correctly speaking, that with regard to the old proprietary body on the estates, beyond a certain sum, is not to be taken from them during the period of settlement.

1742. Then the ryots will participate in any advance in prices along with the talookdars?—The ryots are of two classes: those who have rights to hold at certain rates would participate, but where the cultivators have no rights beyond a lease of the year, they would not.

1743. And no provision was made for them?—No provision was made for them.

1744. In that respect they are on the same footing as the Bengalees?—Yes.

1745. You have expressed a very decided opinion against a permanent settlement; what is your opinion of the policy of selling land free from all revenue?—My opinion is quite against it; I think it would be better not to do so, because I think we might go on until the whole land was sold, and there would be no revenue. After all, the Government look chiefly to the land for revenue, and if they were to forestall it, and to get the money and spend it, it would be a very disastrous thing eventually. I think that the redemption of the land revenue has been stopped. You are not allowed now to sell the land assessed with revenue, except under special circumstances. I believe they allow sites for houses and gardens, and perhaps tea plantations might come in also to be sold; but the land revenue for estates generally is not to be sold.

1746. In all cases where the land is sold, how do you think the money ought to be appropriated?—It ought to be invested in Government securities, I think.

1747. It ought to go in discharge of the debt, and not be spent as revenue?—Certainly.

1748. Sir T. Bazley.] During the 30 years of peace of the North Western Provinces, has the condition of the people very palpably improved?—Certainly. Their houses are better, their clothing is better, and they are more comfortable in every way.

1749. Is their food pretty abundant?—Yes; and altogether they are greatly improved.

1750. Have they any other resources than those of agriculture?—The mass of the people are agriculturists. I think that out of 30 millions of inhabitants in the North West, 18 millions are agriculturists;

Sir R.
Montgomery,
K.C.B.,
C.C.S.I.
21 April
1871.

Sir R.
Montgomery,
K.C.B.,
G.C.S.I.
21 April
1871.

agriculturists; that would leave 12 millions of non-agriculturists.

1751. In what may the 12 millions generally be employed?—They would be shopkeepers and traders, and labourers and soldiers, and servants of different kinds, and mechanics, and so on.

1752. Are they celebrated for any manufactures of any kind?—Their cloth manufacture was very good until the English cloth undersold them; and even now they prefer their own manufacture, because it is much more durable than English cloth; still English cloth is so very much cheaper, that it has almost ruined the trade in their own manufacture.

1753. Of what material has the cloth been composed that you speak of?—I mean cotton goods.

1754. Do these surplus products of any kind of manufacture go into the neighbouring states as exports?—I do not know that manufactures are exported to a great extent. Brazen vessels are made to a very great extent; they are exported a good deal into foreign territory; and cloth to some extent.

1755. Any sugar?—Yes, agricultural products; sugar and grain, to a very great extent; and cotton.

1756. Do they send much of their agricultural produce out of the North Western Provinces?—Yes, they do; they send it both down the Ganges and down the Jumna, and especially of late years they have done so much more. They are learning the prices at the different places by telegraph, and they watch them as you watch them in this country, and they send the produce wherever they get the best market for it.

1757. Then they are enriching themselves?—Certainly.

1758. Mr. Lyttelton.] I suppose we may assume that the system of the permanent settlement has been recommended by the Home Government for political, more than for economic reasons?—That is one of the causes, I think, for recommending it; but I very much question whether the benefits are not much outweighed by the ill effects, I might say, in the decrease of revenue, because a 30 years' settlement is a very long lease, and the persons who would benefit by that 30 years' settlement are the proprietors who are comparatively a small body, whereas the great mass of the people will have to be taxed hereafter to make up the deficiency of the income; so that I think, on the whole, my opinion is against the permanent settlement.

1759. But, speaking of the proprietors alone, is it found that a system of permanent settlement gives them a stronger interest in the stability of our Government than a system of limited settlement?—I do not think that, practically, that has been found. I do not think that there are any more loyal people than the Sikhs in the Punjab, or I might say than the North Western Provinces; and they have hitherto not had a permanent settlement; they are quite as loyal as the Bengal people, who have had it for 100 years.

1760. With regard to another advantage claimed by the advocates of the permanent settlement, namely, that a permanent settlement prevents the deterioration of the land towards

the close of the term of settlement, is it found that that is the case under a limited settlement?—Not to any extent.

1761. Not with the 20 years' settlement?—No; I think the people have confidence that the Government will only take a fair share of the net assets, and I do not think that they do what you allude to. Besides, if the Government officers found that lands were at all thrown out of the cultivation for the purpose of deceiving the Government, they would be wise enough to see it, and would not give them, the proprietors, the benefit of it.

1762. Why has the term been increased from 20 years to 30 years; was that independent of considerations connected with that deterioration?—The Government considered that it was desirable to give them a longer lease; it saves moreover a great deal of trouble, because at each revision of settlement you have to send surveyors and an army of officers to look over the country and to re-measure the estates; a great deal of expense is entailed upon Government, and a great deal of inconvenience upon the people; and upon the whole it is considered better that it should be a 30 years' settlement; it is a more favourable one for the people.

1763. Is it expected that the longer lease will stimulate agricultural improvement?—I should think so.

1764. To a greater extent than a more limited one?—Yes; I think they take a greater interest in it in the way of expending capital.

1765. Mr. B. Denison.] Referring to the question of the treatment of the talookdars, was there not at the time when the revenue settlement of the North Western Provinces was in its infancy, a political reason at the bottom of that policy; was it not considered by those who were responsible for the administration that it was impolitic to have a large number of powerful talookdars?—No, I am not aware of that.

1766. You believe it to have been simply a mistaken notion of their rights?—I think it was a particular view that the Government took at that time.

1767. With whose administration should you particularly identify that policy of breaking up the talookdars?—Well, I should suppose it may be attributed to Mr. Robert Mertins Bird.

1768. It was not a policy which emanated either from the old Court of Directors, or yet from the Supreme Government?—I think not; but no doubt it was reported both to the Supreme Government and to the Court of Directors, and they must have been aware of it.

1769. You spoke of the talookdars as being absolute proprietors of the soil; was it not the case in many instances, both in the North Western Provinces and in Oude, that they were simply mediums for the collection of the Government revenue?—In some cases in the North West that certainly was the case, but to a much less extent in Oude; in Oude they were more generally old established proprietors who possibly may have got grants of land in former times, and brought it into cultivation themselves, and increased their estates in different ways by purchase; and in many cases under the native government the small proprietors of villages, finding that the talookdar was a powerful man, ranged themselves under his standard for protection.

tion, and probably for generations, as it were, attached themselves to particular talookdars; they considered that they belonged entirely to the talookdars.

1770. On our first occupation of the province of Oude in 1856, the policy of that day was to imitate the policy of the North Western Provinces, and to break up the talookdars, was it not?—Yes, the talookdars were set aside.

1771. After the events of 1857, that is to say, after the Rebellion, did you reverse that policy; did you reinstate the talookdars?—Yes; I was instrumental in reinstating them. Lord Canning was aware, and I think was sensible, of the mistake that had been made, and when he confiscated the whole province it enabled him to make fresh arrangements, and such arrangements as he thought best, and he reinstated the talookdars in the position that they had before we annexed the country.

1772. As regards cesses on rent-free tenures, have you known of any difficulty, or have you had any difficulty, in any of the North Western Provinces, the Punjab or Oude, in obtaining road cess or education cess from rent-free tenures?—I am not aware of any difficulty in that respect.

1773. But the objection, at all events, has not been allowed?—No, I think not.

1774. One of the witnesses who have been before the Committee gave it as his opinion that where a local improvement could be shown to be to the immediate advantage of the proprietors of the soil, they would not object to a special cess for the promotion of such works; have you any opinion on that subject?—Well, it depends upon how it is carried out. If it is carried out in communication and in concert, I may say, with the people, and they had the means of doing it, I think they would very readily enter into it. But, generally speaking, in India we set aside the people altogether; we devise, and say that such a thing is a good thing to be done, and we carry it out without asking them very much about it. I think that if they were consulted and brought more into our counsels, if I may say so, they would be very willing, certainly, if it were anything improving their own property, to enter into it.

1775. At all events, the experiment might fairly be tried?—Certainly.

1776. In the case of a tramway, or a short railway, and so on?—Yes; the agriculturists generally are very poor, but as far as they can go, I think they are becoming very much alive to all these tramways and railways.

1777. Has it come within your knowledge that a water rate must be demanded from proprietors who have not used the canal for which it was demanded?—There was a proposal, I think, that such should be the case; but I do not think it was carried out.

1778. Is agriculture at the present day very much in the same state in Upper India as you knew it 30 or 40 years ago, or do you think that it has improved?—I think it has improved; I think people are more alive to the value of manure than they were. Although it is very much in the same state; I think, on the whole, there is an improvement.

1779. You do not know whether there are any statistics showing the comparative yield of the soil per acre?—No; comparing the past

and present, I am not aware of any such statistics.

1780. Then, in any future settlement, the increase of land revenue that the Government might hope for would come more from cultivable land having been brought under cultivation than from an enhanced yield of the soil?—Yes, but there is no question whatever that prices will rise, and are rising very rapidly; and if prices rise, I think Government would get the advantage, or a certain proportion of the advantage.

1781. But speaking generally, the science of agriculture does stand still?—I think there is an improvement, but still the improvement is not very great, and I think that they would readily take up any improvement where it could be shown that it really was an improvement. I think that we try to introduce many of our English ideas which utterly fail there. The Agricultural Society of Calcutta, and different local agricultural societies, have done a great deal, but the real improvement perhaps is not great, further than that they have introduced better seeds of all kinds. In that way, I think, improvement has taken place, but I very much doubt whether the actual cultivation of the land has greatly advanced, notwithstanding that the Government have desired to improve it, and do all they can to advance and improve it.

1782. Speaking generally, the land in the neighbourhood of a hamlet or a village is more highly cultivated than land at a distance, owing to the proximity of manure, is it not?—Far more; it is much more rich.

1783. *Chairman.*] What do you consider the proportion of the present production of the land to be generally as compared with what it would be if it were well cultivated in India; have you any idea?—I could not give an idea. After all, water is the great thing.

1784. I am speaking of it apart from water; what is the result of any experiments made to ascertain the ratio of the present production as compared with what it would be if the land were well cultivated?—I do not know that, but I know so far, that if a man were to attempt to cultivate the ground we will say, as an English farmer, his expenses would be so great that it would not pay him; but the Indian cultivator, with his simple way of cultivating it, would make ground pay where certainly an English farmer would not.

1785. Is it the practice to repeat crops till the soil is exhausted, and then let the land lie fallow?—I think the Indian cultivators are admirable cultivators; you would be surprised if you could see the sheets of beautiful cultivation.

1786. *Mr. B. Denison.*] Have you any knowledge of estates in India managed entirely by Europeans?—None.

1787. Then you cannot institute any comparison between the cultivation of Europeans and that of Indians?—No; but I know this, that there have been great efforts made by different societies to try and improve the mode of cultivation; and I must say that I have not hitherto seen that they have succeeded; they might succeed by introducing better seeds. I think that where the cultivators fail is, in sowing the same seed year after year. But what is being

Sir R.
Montgomery,

being done largely in India, is this, they are selecting the indigenous seeds of the country, not taking seeds from America, and other places, for they find that does not answer, but selecting the best indigenous seed of the country, and using that for sowing, and they find that that improves the produce very much.

1788. Perhaps you could get for us, if you have not got it here, what the yield per acre of wheat is in India, on the English measurement?—I think I could probably get an approximation to it.

1789. One of your colleagues told the Committee that, according to his experience in the permanently-settled provinces of Bengal, the proprietors were a thoroughly stagnant and unimproving race of men, and did nothing whatever for the improvement of the land; is that your own opinion, and your own experience?—I do not know anything of Bengal.

1790. In the provinces of which you have immediate knowledge, should you say that the proprietors are in any degree an improving people?—I should say they were a very improving people. The proprietors of villages are extremely improving, and quite ready to advance their own interests in every way possible, with regard to improving the land, and ready, in fact, to take up anything that would improve it, if it is proved to them that the land would be improved by it.

1791. Do you consider that the proprietors of the Punjab are in advance of their fellows in Oude and the North Western Provinces?—No, I do not think so; I think that they are all very much alive to their own interests, and that where they get a fair investment and good titles, they will go on improving their land to any extent.

1792. Supposing that they had the command of a larger capital than they have (you have said that they are poor in that respect), do you believe that anything would induce them to lay out money on their land in the shape of manure, for instance?—Yes; and I think they would sink a great many more wells for irrigation were it necessary, and improve the land.

1793. Is such improvements as does take place brought about by the actual cultivators or by the proprietors?—Generally by the proprietor, I think, and occasionally by the cultivator. In that case the cultivator would make some arrangement that he should enjoy the benefit of that improvement for the time. If it was not regularly drawn out in a deed, it would be an understood thing.

1794. I think you have told the Committee that the orders as to the redemption of the permanent land tax still holds good at the option of the local government?—I never said so; if your remark applies to the permanent settlement of the land tax, my reply is that the local government finding estates in the condition in which it was laid down that a permanent settlement might be made, would report it to the Supreme Government, and it would require the confirmation of Her Majesty's Government in this country.

1795. But is your interpretation of the order this, that it is obligatory upon the local government, wherever the cultivation has arrived at that 80 per cent. of the culturable land, to re-

port the estates for a permanent settlement?—Yes, that is the case.

1796. Then as regards the North West Provinces, almost all the land in the Benares Province was permanently settled, was it not?—Yes; this order does not extend to the already permanently settled provinces, but to the temporarily settled provinces; Benares was transferred for administrative purposes to the North West Provinces, but it is permanently settled; there are four districts that were transferred from Bengal, Benares, Jaunpore, Mirzapore, and Ghazepore, and these orders do not apply to them.

1797. Is there at this moment a strong difference of opinion in the Home Council as to the policy of that measure of the permanent settlement?—The orders were issued about eight years ago, and at that time there was a difference of opinion, but I think the majority were in favour of the orders that were issued; and I have no doubt that the authorities in India were consulted at the time, and when all the opinions were heard they determined that it should be permanent. It was done, I imagine, after great consideration, and certainly the idea was to benefit the people.

1798. Then there is no question at the present day of reversing those orders?—I have never heard them brought in question, and indeed it was only lately that I became aware that the orders were as precise as they were as to the permanent settlement.

1799. You have told the Committee that, speaking generally, you are personally entirely opposed to that policy?—Quite so.

1800. And I suppose that in a case like that of the Central Provinces, of newly acquired territory, that policy would be disastrous?—Quite so.

1801. Mr. Lyttelton.] Is not the order a dead letter in the rest of India?—I cannot say; in fact we do not know to what extent it has gone in the North West; in the Punjab it certainly is a dead letter, it has not been carried out there at all.

1802. Mr. B. Denison.] The Home Government, as I gather from you, are not furnished with periodical reports each year, showing the extent to which this settlement is carried out?—They are furnished with periodical reports, but I imagine that no districts have yet been completed and reported to the Supreme Government, and therefore they have not come to the Home Government; and before they can be finally sanctioned as permanent it is necessary that they should have the sanction of Her Majesty's Secretary of State.

1803. At the time that this policy of a permanent settlement was carried out, was there not also an ulterior intention of redeeming the debt of India by selling the lands?—I think there was.

1804. In fact that was the origin of this policy?—I cannot say that it was the origin of the policy, but there certainly was an intention of paying off the debt by redeeming the land tax.

1805. Do you remember a Despatch of the present Lord Derby's, when he was at the India Office, to that effect?—No, I do not remember it; I was not here at the time.

1806. Your

1806. Your own opinion is adverse to the selling of the land?—Certainly.

1807. From political considerations, or from considerations affecting the future of the people of India?—I think from considerations affecting the Government, because if the land tax was redeemed, and it went to any extent, it might become a very serious thing, and the Government could not be carried on.

1808. Do not you think that probably, and almost certainly, if the permanent land tax of India was redeemed by the proprietors, the future Governments, for the purpose of government, would impose taxation?—Certainly, they must do so.

1809. And from that point of view the redemption of the tax would be disastrous to the people of India, would it not?—Yes; I think so.

1810. And fraught with political danger also?—I think so, because the land tax is a tax that they pay as a matter of course; it is according to their own ideas; they have done it from generation to generation, but taxes such as we would put on are novel and distasteful to them, while they make no difficulty about the land tax.

1811. Mr. *Fawcett*.] You would define land tax as rent, would you not, in distinction from any ordinary tax?—Yes.

1812. Mr. *B. Denison*.] You are aware, no doubt, that the public debt of India, with some small per-centage, say, 10 or 15 per cent., is held by Europeans?—A great portion of it.

1813. And if the debt were to any considerable amount redeemed, the burden of the capital of the debt would be transferred from Europeans to the people of India, leaving India to all the chances and mercies of future Governments?—Yes.

1814. Then neither on political nor on economic grounds do you recommend the redemption of the permanent land revenue?—That is so.

1815. Do you know whether that policy has been carried out to any extent of redeeming the land tax?—To no great extent, if at all.

1816. Mr. *Grant Duff*.] This portion of the permanent settlement in the North Western Provinces has been carried out under Sir Charles Wood's Despatch of 1862, has it not?—Yes.

1817. Nothing further has been done in that direction since you have been at the India Office, has there?—Nothing further.

1818. That policy has not been carried further?—It has not.

1819. Mr. *Fawcett*.] But may I ask whether anything can be done to carry out the policy further; the order is in existence and operation; it does not want anything else, does it?—The Secretary of State could reverse the order.

1820. Mr. *Grant Duff*.] My question was whether anything further had been done in that direction; by which I meant whether any further orders had been sent out in that direction?—None to my knowledge since then.

1821. You find no other objection, do you, with the land revenue system in the North Western Provinces, except that one?—No further objection. I think it has been wisely and fairly done.

1822. And you are satisfied that, on the whole, after various unsuccessful experiments we have at last got a land revenue system in the North Western Provinces which is fair to the possessors

of land, and at the same time fair to that large portion of the population which does not possess land?—I think so; fair and very just.

1823. For a considerable number of years, of course, we shall have no increase of land revenue in the North West Provinces, but at the end of the present settlement do you think that we shall have a considerable increase?—A considerable increase if the permanent settlement does not largely come in; we do not quite know how far it may extend; but if the permanent settlement does not come in, there will be a considerable increase.

1824. Mr. *B. Denison*.] I omitted to ask you if you can tell the Committee at how many years' purchase land has been sold in the redemption of the permanent land tax?—I first of all must say that I do not think the land revenue has been redeemed to my knowledge at all in the North West. I think that in certain cases garden sites and houses, and so on, have been redeemed by 20 years' purchase; but I am not aware that the land revenue anywhere has been redeemed in the North West.

1825. *Chairman*.] Your impression is, that where the proprietary rights have been sold they have been sold subject to the land revenue?—Yes.

1826. Mr. *Bourke*.] I have heard, and seen also in print, that under the order of 1862 of Sir Charles Wood, in some parts of India the permanent settlement arrangements contemplated at that time have become a dead letter, and that in other parts of India they are in full force and effect, and that they are now being operated upon to a certain extent very largely: is that the case?—So far as I know in the Punjab, with which I have a considerable acquaintance, there has been as yet no attempt made to have the settlement fixed in perpetuity; but in the North West, which I am now being examined on, I have heard that the local government are quite prepared to carry out the orders of 1862, and are now prepared to report to what extent it has been done.

1827. But as I understood your evidence, you do not approve of that policy?—I myself do not approve of it.

1828. Do you think that it would be expedient to put a stop to that policy where it has been carried out?—Well, if I state my own private opinion, my own opinion is that the order was an error. It was well meant, but I think it was an erroneous policy.

1829. And politically, do you think that there would be any difficulty or danger in putting a stop to that permanent arrangement going further in localities where it has been put in practice?—Where it has been actually put in practice, and the promise has been made, of course that could not be done; but where it is only under consideration, I think there would be no difficulty in doing so.

1830. Mr. *Fawcett*.] Can you tell the Committee exactly how it comes to pass that if this order of Sir Charles Wood has been in operation for nine years, we have no record at the India Office showing to what extent it has been carried out?—Yes, I can; because it could not be done till such time as the revision of the settlement commenced. Now the estates generally did not come under revision before 1864 or 1865, and the settlement of districts takes a long time; they

they require to be measured, and rights have to be gone into, and the last thing of all is the fixing the assessment. It takes several years to complete a tract of country, and these recent orders are of course extremely important. It is required that the matter should be looked into with great consideration, and thoroughly investigated in every point; and I can quite understand that they were not in a position till about this time to report; and I believe that in a very short time we shall have a report to what extent it has been carried out.

1831. You said that you thought it of great importance that the people of India should be consulted, and that if they were consulted with regard to arrangements for local taxation, many of their objections might be removed; have you any plan to propose; would you suggest any kind of representative assembly?—I think they would be most valuable as a consultative assembly. I would not give them the power to legislate, but I think that if each local governor had a consultative native body, which he would select from year to year, or from time to time, and before which he would put certain points or questions, whether on taxation or any law, which might affect their welfare generally, he would get a most excellent opinion from them; and with that opinion, and the opinions of the officers of the local government, he would be able to arrive at the right decision.

1832. Therefore you propose that these local consultative bodies should be entirely nominated?—Yes, I would give no power of election.

1833. You do not think that the people of India are ripe for the election of representatives?—No; I think that the local governor would select the best men from particular parts of the country, and at first certainly I would go no further than having a certain body before whom he would have put certain questions.

1834. We may distinctly understand that up to the present time this order by Sir Charles Wood as to the permanent settlement, which you have described as so unfortunate, is in full force, and nothing has been done by the India Office to limit its operation?—Nothing has been done to limit it, nor have we had any report yet to what extent it has gone.

1835. Mr. Lyttelton.] Am I right in supposing from what you have said, that the re-settlements are nearly completed?—I think I said

the revision of 10 districts was completed, but they were not reported; they require to be reported for sanction, and they have not yet been reported.

1836. The assessments are still subject to revision?—Yes, till such time as confirmed by the Government.

1837. Mr. B. Denison.] In answer to the honourable Member for Brighton, you said that you had no knowledge of other taxes being laid on the landowners; the income tax you have not taken into consideration?—I thought the question meant local taxes for local rating; the income tax, of course, has been imposed.

1838. Do you know whether, in the view of the landowners, the extension of the income tax to them was looked upon as a breach of faith?—It was not looked upon as a breach of faith, but it was considered as a great hardship.

1839. Chairman.] In the accounts of the expense of collecting the land revenue in the North Western Provinces, I see that the total is given as 417,221 l. for the year 1869-70; that is made up of three items; the first of which is 274,771 l. for "collectors of revenue, salaries, establishment, and contingent charges." Do you know whether that is the whole expense of those charges, or whether it is only an allocation of that portion of the expenditure upon the establishment which is supposed to pertain to the land revenue?—It is an apportionment; a moiety.

1840. The rest being charged to the administration of justice, or police?—Yes.

1841. Then I see the next item is 38,988 l. for "charges on account of Khas Mehals;" is that an expenditure for the management of the properties which are in possession of the Government, as if they were the owners, from some cause or other as contra-distinguished from property ordinarily assessed for the land revenue?—I really have no personal knowledge.

1842. Supposing the Government held any such property in the villages, would the villages be able to purchase it back?—They would have a prior claim over others.

1843. Then the next item is "Revenue, survey, and settlement charges," 103,462 l.; that item will continue as long as the settlement is going on, I presume?—I think so.

Sir CHARLES JOHN WINGFIELD, K.C.S.I., C.B., a Member of the Committee; Examined.

Sir C. J.
Wingfield,
M.P.,
C.B., K.C.S.I.

1844. Chairman.] WILL you be good enough to state what offices you held in India?—I rose in the ordinary gradations, in the North Western Provinces, to be a Collector and Magistrate. Then I was transferred to Oude, as one of the Commissioners of Divisions. Then, on the mutiny, when I made my escape from the mutinous troops, I was ordered to take political charge of a division of Goorkha troops, who had been sent to the aid of our Government, and with them restore order in the revolted districts on the borders of Oude. Having been engaged in that occupation for about a year; I was, in the beginning of 1859, appointed Chief Commissioner for the Government of Oude, a post in which I remained till the beginning of 1860,

when I resigned the service of the Government.

1845. Will you be good enough to state what was the condition of Oude, in regard to the raising of the land revenue there at the time of the acquisition of the territory by the British Government?—Tracts of country were leased out to farmers and contractors. There were also the native collectors, called nazims, in charge of particular districts of the country; they are either sub-let, or collected direct from the talookdars and village communities. Then it was very common, if a regiment of troops was in arrears of pay, for them to have a district assigned them to collect their pay out of. In fact, it was the same system that prevailed under all native

native rulers, and particularly under weak native rulers.

1846. There was some intermediate agent between the Government and the person who actually paid the revenue, who became responsible for the collection of it?—Yes.

1847. What was done with this system when the British Government took possession?—When we took possession we displaced the native functionaries entirely, and appointed our collectors and deputy collectors to do their work, and to take their place. First of all, on occupying the country, it was necessary to make a temporary arrangement for the revenue; and as the winter crop was being cut, we had to make arrangements with the parties in possession for the payment of the revenue on that winter crop; that was done in about a month's time. Then we proceeded to make a settlement for three years, or until a revised settlement could be made. In pursuance of that design, we proceeded to carry out a settlement on the same principle as the settlement in the North Western Provinces (as recently described by Sir Robert Montgomery as having been carried out under the orders of Mr. Bird) was effected; and according to the policy that was so highly in favour then of setting aside the superior proprietors or the great chiefs called the talookdars, the settlement was made mainly with the village occupants. To such an extent was the system carried of ousting these talookdars, of disregarding their proprietary rights, and treating them as merely channels for the payment of revenue, that I think they lost about half their estates.

1848. But had the class that you call talookdars previously been regarded as the owners, subject to the rights of the occupants?—Entirely. The native government had taken its revenue direct from the talookdars; many of them were not in the least under the orders or control of the governors, or native servants of the Government; they exercised a semi-independence, paid their revenue into the Treasury at Lucknow, and were not interfered with at all, but had plenary jurisdiction on their estates.

1849. Did they pay a fixed sum, or was an assessment made on them from time to time? From time to time; but generally it was light, because you could not get a heavy assessment from them: they had their forts and their guns, and if you demanded from them more revenue than they liked to pay, they resisted, and would hold out, and perhaps defeat the Government troops.

1850. But as between them and the persons who held under them, was there any definition of rights?—None whatever under the native system.

1851. But did the persons who held under them claim to have distinct rights of property under them?—In many cases they did. These talookdars were of two kinds. The majority were the chiefs of Hindoo clans of the military caste, whose ancestors had colonised and conquered the country about the 13th and 14th centuries, when the Mahomedan invasion drove the Hindoos from the neighbourhood of Delhi. These were the great majority; some few who were Mahomedans were descendants of the ancient Afghan conquerors; and some were people of recent origin, contractors, speculators, or officials who had made use of their official influence to

acquire the possession of land; but the great majority were ancient hereditary proprietors.

1852. Who as such paid the revenue?—Yes.

1853. And they collected from the persons who held under them whatever they were entitled to?—Yes, and in regard to a great part of their estates, they were the sole undisputed proprietors. There was nobody who ever did claim any right under them. No doubt in almost all estates of this kind some villages belonging to small and independent proprietors had been acquired by force or fraud; but also it was a very common practice under the native government for the owners of the small independent villages to place themselves under the protection of a talookdar to put their villages, one may say, into his talooka, and to get him to engage with the Government for the revenue, in order to secure them from the oppression of the native functionaries.

1854. What was the general result of the settlement that was first made with regard to revenue; was it an increase of the revenue?—No; we had no time to make an increase, we simply looked at the accounts of the native government, found out what the man had been paying as nearly as we could, and just took that amount.

1855. Can you state the total sum raised at that time?—I think as nearly as possible 1,040,000*l.*, or under 1,100,000*l.*

1856. How long did that arrangement last?—That only lasted a year, because then the mutiny broke out; it lasted from May 1856 to, you may say, May 1857, when the mutiny broke out.

1857. What steps were taken after the mutiny was quelled?—After the mutiny was quelled, that is to say, after Lucknow was taken, because the rebellion cannot be said to have been quelled immediately, Lord Canning issued a proclamation, his famous proclamation, which was made the subject afterwards of discussion in this House, as you will remember, in which he confiscated the entire proprietary rights of the people of Oude for their general participation in the insurrection, but at the same time indicated that all who would tender their submission to the British Government would receive back their lands; and in accordance with that notice, a great many tendered their submission; and later in the year when the armies were enabled to move into the interior, and finally expel the last insurgents, they nearly all came in, and every talookdar then was allowed to engage with the Government for precisely the estates that he had in his possession when the country was first annexed. So that, in fact, the proceedings which we took with regard to the settlement at annexation were entirely reversed.

1858. Can you state generally the effect of this new arrangement; did that dispose of the territory of Oude, or was any part undisposed of as either uncultivated or otherwise held?—I may mention that some seven or eight great talookdars would not come in under the amnesty. Their estates were confiscated to the British Government, otherwise this settlement disposed of the entire territory of Oude, barring a tract of forest which was made over to the King of Nepal in consideration of the assistance which he rendered us in the campaign.

1859. Then was the whole territory meted out amongst the talookdars, or was there any portion

1871.

portion of it held directly from the Government by village communities or otherwise?—About one-third was held direct by village communities; in some districts you would find few talookdars and nearly all village communities; in others they would be all talookdars nearly, and few village communities.

1860. What was the effect of this arrangement upon the land revenue; was the settlement with the talookdars made for a limited period, or upon what principle was the amount of the revenue assessed?—This settlement was also made just like the first, for three years until a regular settlement could be made, and it was made with them on the basis of the payments that they had previously made to the native government.

1861. They being recognised as proprietors of the estate, but subject to the assessment that might be made?—Yes. I perhaps may mention that about the year 1859 Lord Canning came to Lucknow, and in compliance with the representations that I made to him about the desirability of giving a pledge and assurance that this settlement with the great talookdars would not be set aside again by some new policy, he confirmed it in perpetuity, and gave them title deeds, declaring that these estates were settled on them in perpetuity, subject only to revision of the assessment, and also subject to the maintenance of all subordinate rights that might on inquiry be found to exist; thereby, while giving permanence of tenure, we avoided the error of the Bengal settlement, which had disregarded the subordinate rights of the people living on the estates, and also fixed the assessment in perpetuity.

1862. It in fact had confounded the revenue with the tenure?—Yes.

1863. What was the effect of this new settlement as regards the amount of the revenue?—I was saying that this new settlement made no change in the revenue; it merely took the amount that had been taken by the native government. But this was only a temporary one for three years; on the expiration of that, or immediately after the province was re-occupied, arrangements were made for surveying the country and making a settlement for 30 years, after careful inquiry and investigation. That settlement has been going on now for the last 10 years; as far as I can gather from the last administration report of the province, which was only up to April 1869, it was more or less completed in, I think, some seven districts out of 12, and it had led to an increase of revenue from, I think, 1,040,000*l.* to 1,300,000*l.*; I always contemplated, and I do now, looking at the progress that has been made, that the land revenue of Oude, when this settlement is completed, will be fixed at 1,500,000*l.*; some four or five districts remain to be assessed, and some of those are the districts in which the greatest increase is to be expected, because they were in the most backward state, or we knew least about them, and the temporary assessments there were the lowest, and therefore I expect it will be 1,500,000*l.* when this settlement is completed.

1864. In assessing the talooks, do you take into account the quantity of land in the talook that is cultivatable, but uncultivated?—Yes; you assess the talookdar's estate precisely in the same way, village by village, as you would a village communities' land.

1865. But in what way do you deal with land that at that moment happens to be uncultivated, though cultivatable?—You treat all uncultivated land that has only been thrown out of cultivation in the ordinary course of rotation or for two or three years, as cultivated.

1866. But supposing that there is a part of a village which is not cultivated, though cultivatable, from want of cultivators, how is that treated?—If there was a large proportion of uncultivated, though cultivatable land, there might be a rate put per acre on that land, or the settlement officer would, in determining the demand on the village, take the circumstance into consideration, and add so much more to the assessment according to what he thought the capabilities of the village population to bring this land under cultivation.

1867. In fixing these talooks, was all the land that was unoccupied or natural pasture, or other land thrown into the talooks, or was it treated as land belonging to the Government?—In Oude it was very much the practice for the talookdars to keep a tract of forest about their forts by way of making them difficult of approach, and if they had to evacuate them when they were attacked they made their escape through the forest. These were all ordered to be cut down, and then they were treated as assessable land. But also there was a great deal of land in Oude left waste, because the possession was disputed by the village communities, and these used to be the scenes of tremendous fights and affrays. When the boundaries of each village were fixed by the survey all those disputed claims to that land were settled, and then that land, of course, was at once taken up into cultivation.

1868. Is a very considerable part of Oude uncultivated, that is cultivatable in its character?—The returns of the assessment show that in those districts that have been settled now in which the settlement is completed, 54·60ths of the area is under cultivation, which is larger than in the North Western Provinces; but I may mention that Oude is about the richest and most densely peopled part of India. The population is 11,220,000 in the last Administration Report for the year ending 31st of March 1869; that census was taken in 1868, and that gives 466 people to the square mile. We always underestimated it, and nobody imagined the population was so dense till there was a regular census taken. I may say, as regards there being much waste land, that there is very little waste land left now, except in the primeval forest under the hills, which is very unhealthy, and which can only be gradually encroached upon, otherwise there is very little left. Immediately after the re-occupation of the province, rules were issued for the grant of waste lands; and these rules were that the land should be held for 12 years free of all revenue demand, and after the expiration of 12 years, provided a certain proportion had been brought under cultivation, which was prescribed in the rules, and which was one-quarter in six years, and one-half in the 12 years; the land then would be assessed at precisely the same rate as any other land, and if those conditions were not complied with, that is to say, if that proportion of land had not been brought under cultivation, the man would not get the whole of the grant, he would only get just so much

much waste as was equivalent to the amount that he had brought under cultivation.

1869. You have not explained what is the condition of the other 46 per cent., because you have only mentioned 54 per cent. that is under cultivation?—I can give you that at once from the return: 54·60 per cent. is cultivated; culturable, but not under cultivation, 21·51; then barren, 7·82; then you have tanks, 6·54. Oude is abundantly supplied with natural reservoirs.

1870. Are they made near the hills?—No, they are natural depressions of the soil that fill; they may have been gradually deepened in parts; they are not near the hills, but all over the country and down near the Ganges. In many parts you can make a well for a very trifling sum. There remain some smaller items which will be found in the return.

1871. The 21 per cent. you describe as culturable is considered to be under assessment, though not actually cultivated?—Yes; you put a rate on the cultivated land, and then the settlement officer throws in something for culturable; he says, "I think this is culturable, and there is population enough in the village to bring it under cultivation; I will put sixpence an acre on this land." That is the sort of way it is done, and it pays no more during the term of settlement.

1872. But supposing the 21 per cent. of culturable land to be more completely cultivated than it is at present in conjunction with the cultivated land, that would be a ground for raising the assessment in future settlements?—Yes.

1873. Then is it your opinion that on the present settlement, when it is completed, the land revenue would amount to 1,500,000*l.*?—Yes, very close to that.

1874. Has there been any considerable increase of prices in Oude?—Very great; I should say it is a peculiarity of that country that there never has been a famine known there; certainly not within the last 100 years has such a thing been known; there is no record of such a thing having happened.

1875. Then there would seem to be very little land apart from that which you have spoken of as culturable, that is capable of being made a source of revenue except the forests?—Except the forests there is very little waste land left; but I think that what has happened there has happened elsewhere. I was mentioning the rules under which waste land was given. Afterwards when that order of Lord Canning's came out allowing it to be bought at 5*s.* an acre, a great many of those grantees that had got the land under the rules to which I have referred were allowed to commute, and they bought their grants; and I see that altogether land to the amount of about 90,000*l.* has been sold in Oude, but about half of that will be irrecoverable, and the land will be thrown back on the hands of Government.

1876. Mr. *Fawcett*.] In what way would it be irrecoverable?—Because these men have failed. Though these lands were sold, the money was not paid down outright. In the meantime all that speculative excitement, about waste land in India, has passed away.

1877. *Chairman*.] You mean irrecoverable from its waste condition?—I meant that the purchase money would be irrecoverable.

0.59.

1878. Mr. *J. B. Smith*.] And then does the land revert to the Government?—Yes.

1879. *Chairman*.] Were those sales made sales of the right to levy the land revenue from them, as well as the proprietary right?—They were sold in the fee simple.

1880. But also with an engagement from Government that no land revenue should be taken from them?—Certainly, freed from their liability for Government revenue.

1881. Mr. *J. B. Smith*.] But still liable for rates?—There was nothing said about rates that I am aware of, except police cess and road cess; those two were named.

1882. What was the price at which they were sold?—What was sold under Lord Canning's rules was sold at 5*s.* an acre, but then when Sir Charles Wood modified that order, and said the land should be sold by auction, some of the land fetched enormous prices, 20*s.* or even more an acre. Under Lord Canning's rules, anybody could say, "Give me this land at 5*s.* an acre," and he got it.

1883. *Chairman*.] How many years ordinary land tax would that 5*s.* or 30*s.* represent having regard to the character of the land sold?—In the case of some of the land near the settled villages, I believe some of these grantees immediately let that land at 1*s.* an acre.

1884. That would represent how many years' land revenue?—That at 5*s.* an acre would be 10 years' land revenue.

1885. Would the shilling that they immediately got be their permanent rent?—No, they would go on increasing that. I know that some capital purchases were made at first, but then the best was all taken at first, that is to say, the land most accessible to the villages, to the settled parts, so that you could get cultivators easily to come and occupy it. The further off you went from the inhabited parts, the more difficult it was to get people to come and cultivate it, and the lower rents you got.

1886. What would have been the land revenue on that land when it was in full cultivation after it had been brought to the ordinary condition of the land of the country?—I see by this return that, with regard to the average assessment in Oude, so far as it has gone, that is to say, taking 16,800 villages out of 24,000 odd villages, which is the total number in Oude, the average rate of the assessment per cultivated acre is 4*s.* 2*d.*

1887. Therefore the sale would represent less than 2½ years' purchase of the ultimate revenue to be derived from it?—Yes. Now that rate of 4*s.* 2*d.* is high. Sir Robert Montgomery said that in the Punjab it was only 2*s.* In the North Western Provinces it is less than in Oudh; but it is not complained of, and that only shows the wonderful fertility and richness of that country.

1888. Is it due also to the fact of the water being very easily obtained?—To the water being very easily obtained, and to the population being so dense that the rents are very high.

1889. Is there a very large irrigated crop taken off the land?—It differs very much in different districts. There is one district here mentioned, called Roy Bareilly, in which 1,072,000 acres are irrigated, and only 346,000 unirrigated; now that irrigation is almost entirely from these reservoirs, or these swamps, for they

cannot be called reservoirs; they are depressions and hollows in which the rain water collects, and also it is owing to the wells.

1890. And those wells, you say, are very easily sunk?—Yes, in many parts; a man will sink a well in a day or half a day, and at a cost of perhaps 1s. or 2s. 6d.

1891. And the soil itself is very rich and productive?—Yes.

1892. Mr. J. B. Smith.] To whom do these reservoirs belong?—They are the property of the villages amongst themselves; one of these tanks, as they call them there, would perhaps irrigate a dozen villages.

1893. Mr. Hermon.] These tanks are seldom dry?—Never quite dry; it must be a very exceptional year if they are quite dry; but such years have not occurred.

1894. Mr. Fawcett.] Do they pump the water up by machinery?—No, they ladle it up step by step till it reaches the land they want irrigated.

1895. Chairman.] Was any difference made in the amount of the land revenue between that which is paid by the villages settling direct with the Government as compared with those settling through the talookdars?—None whatever. You take the presumed rental derivable from the proprietor; if that proprietor happens to be a cultivating proprietor, he gets the advantage of his cultivator's profits and his proprietor's profits also; but you have the same rate of assessment for all.

1896. Then, as far as the Government were concerned, it was the same thing whether they settled direct with the talookdar or with the village; it was a mere question of proprietary right between the villagers and the talookdars?—Yes.

1897. Is it your opinion that the villagers in the villages which settle direct with the Government are in as good a condition as the villagers holding under the talookdars?—Many people would say that they necessarily must be so; but my idea is that they are equally well off under the talookdars, for this reason: under the native government the talookdars did not oppress the leading men of the villages, because they wanted their assistance to fight; they composed their armies, and they were obliged to humour them. Under our Government we have ascertained and recorded, and fixed whatever subordinate rights they possessed. If they are found to be really the proprietors of the village, and it is known that ever since their village has been included in the talookdar's estate, they have retained the management, they keep the management now, paying a head rent to the talookdar. If, on the other hand, it is found that their rights, if ever they existed, have been impaired in the course of time, and they have only a few vestiges of them left, what little they have retained they are permanently secured in.

1898. Is there any perceptible difference between the condition of the villages and the people occupying them, which are held direct from the Government, and the villages held under the talookdars?—No, it is utterly imperceptible.

1899. You do not perceive any such difference in going into a village?—No.

1900. Then we are not to look for any increase of the land revenue from Oude beyond that which you have stated?—No; because this is the first

regular settlement, and this has produced an enormous increase; but then I must say that we had no information on which to fix the temporary settlements that were made; I know that in most cases the Government demand was grossly understated.

1901. Do you anticipate that in a future re-settlement, taking all these circumstances into account, there will be any considerable increase?—The increase must come from the rise in prices; there is not much to come evidently from reclaiming waste land.

1902. Or from better adjustment of the revenue, or from other causes?—This settlement is fixed on the principle of 50 per cent. of the rental; if we had made it on the principle of the old settlement of the North Western Provinces it would have yielded very much more.

1903. Do you think that the present settlement is so far accurate, that there is not likely to be any great increase when it is re-examined?—No, not any increase, except from the increased value of land.

1904. Are there many, or are there any estates in Oude held at a fixed revenue or without revenue and by free grant?—Only those that have been given in reward for services rendered in the mutiny.

1905. Were none found to exist or recognised under the native governments?—Yes, but few; and those were principally given to relations of the royal family, wives, and courtiers. There were also many small grants to religious persons and others.

1906. They will lapse after a certain period, I suppose?—Mostly; I think very few are held in perpetuity.

1907. Do you think it is a good thing for the Government to grant out land free from tax in reward for services?—No, it is not a good thing; but it is a mode of rewarding services which is very acceptable to the natives, and in such a case as the mutiny, we did not look at it very strictly.

1908. You would not approve of that as an ordinary thing?—Not in the ordinary way.

1909. Mr. J. B. Smith.] For what period was the settlement?—For 30 years; just the same as in the North Western Provinces.

1910. Sir D. Wedderburn.] I believe in Oude the talookdars occupy very much the position which zemindars in Bengal were erroneously believed to occupy; they were, in fact, a sort of feudal nobility, not the farmers of the revenue under the Government?—Just so; they were the chiefs of Hindoo clans of the military caste, and whose ancestors took their clansmen from the neighbourhood of Delhi, when they had to flee from the Mahomedan conquerors, and settled in Oude, because Oude was held at that time by rude pastoral races, whom they extirpated.

1911. And they exercised little or no oppression over their immediate cultivators, but were, in fact, rather protectors as against the central Government?—It is difficult to say that. If the Government left them alone, and did not make heavy demands of revenue on them, they would leave the people under them alone; but if the Government was oppressive on them, they would be oppressive on those under them. One of the largest talookdars in Oude, the talookdar with whom I went and took refuge when I had

had to fly from the mutineers, was under the native government before we annexed the country, branded as a freebooter, and driven off his estates, and took refuge in a neighbouring British territory. Such representations of his iniquities were addressed to the British Government against him, that actually British troops were about to be set in motion against him; that talookdar is now a member of the Governor General's Council, and the largest proprietor in Oude. The fact was simply that no man could get on with the native government who did not make himself formidable.

1912. I believe under the native rulers Oude used to be considered the garden of India, and it is on record that the commander of a British regiment, and one of the first British regiments that marched into Oude, complained that he could not find a piece of waste land to encamp on?—It was no doubt at one time exceedingly rich, but during the reign of the last sovereign, govern-

ment was very much relaxed, and it got into a very disordered state.

1913. Then has it now recovered, under our Government, anything like the prosperity that it had?—I should think far greater; I think the land is better cultivated now than it ever had been before, and more land is cultivated.

1914. Is there any reason, from the character of the population or the constitution of the country, why Oude should be under a separate government from the North Western Provinces, which almost entirely surround it?—No, except that it would make the North Western Provinces too large if you added it to them; but immediately after annexation it was absolutely essential that it should be separately administered. The question of the distribution of territory is a very large question; it ought to be considered as a whole. With regard to the whole of the Bengal Presidency now, no doubt the jurisdictions ought to be altered and remodelled.

THE RIGHT HON. ACTON SMEE AYRTON, IN THE CHAIR.

SIR CHARLES JOHN WINGFIELD, K.C.S.I., C.B. (a Member of the Committee), further Examined.

Sir C. J.
Wingfield,
K.C.S.I., C.B.,
M.P.
—
25 April
1871.

1915. *Chairman.*] HAVE you anything to add to the evidence which you gave on the last occasion?—Will you allow me to say that on Friday last, thinking that my examination was to end on that day, I endeavoured to compress my evidence as much as possible; and there are one or two points bearing very materially on the condition of landed rights in Oude, as fixed by the policy of Lord Canning in 1859, on which I would like to say a few words now. You are doubtless aware that the effect of this confiscation of the proprietary rights in the soil of Oude was very much misapprehended at the time. Because the talookdars were all replaced in the possession of the estates which they held prior to the annexation of the country, it has been assumed that the confiscation never had any practical effect at all. But that is not so, for although they were restored to possession of the estates which they held before the annexation, it was by free gift of the British Government; the entire proprietary rights were confiscated; and therefore they re-entered in possession, not by virtue of any previous rights, but by free gift from the British Government. The title deeds that were given to them set out by saying, that “Whereas by the proclamation of March 1858, by his Excellency the Right Honourable the Viceroy and Governor General of India, all proprietary rights in the soil of Oude, with a few special exceptions, were confiscated, and passed to the British Government, which became free to dispose of them as it pleased, “I,” So-and-so, “Chief Commissioner of Oude, under the authority of his Excellency the Governor General of India in Council, do hereby confer on you the full proprietary right, title, and possession of the estate.” I may mention that those special exceptions that are named in the title deeds were in favour of five or six talookdars who had shown loyalty to the British Government during the rebellion, and who had some of them sheltered and befriended fugitive English persons.

1916. Under that form of grant is there not an absolute right of alienation?—There is a clause in it which says, that a full power of devising by will, gift, or in any way they please, is conferred on the possessors of these estates, but should they die intestate the succession is to be by

the law of primogeniture, or rather the law which is called the law of primogeniture in India, but is more properly described as succession undivided to a single person, because it did not always follow that the eldest son inherited; in native times, if he were incapable or a lunatic he would be set aside for another son. Then it is worthy of notice, that but for this confiscation of the entire proprietary rights in the soil of Oude, and their lapsing to the British Government, it would not have been so easy for the British Government to set aside the policy which it pursued at the annexation of the province, which was a totally different one.

1917. Have you any other point to mention?—The next point I wish to remark upon is with regard to the position of the cultivators of the soil in Oude; that is, of the class that have no proprietary right in the soil, and claim none, but who till the lands of the proprietors, be those proprietors great or small, on payment of rent. When Lord Lawrence became Governor General he wished to carry out in Oude the system that had been adopted in the North West Province and in the Punjab, which was to declare those cultivators, who had been 12 years, or 20 years, or some period of time, in occupation as renters of the land of the proprietors, to be possessed of a right of occupancy in that land. The Members of the Committee will have seen from the evidence of Sir Robert Montgomery that, in reply to questions put by me, he stated that both in the Punjab and in the North West Provinces, in his belief, this distinction between cultivators with rights of occupancy and cultivators without rights of occupancy was a distinction purely drawn by us, and was utterly unknown to native custom. That also was very strongly my opinion, and I objected to this proposal of Lord Lawrence, and the talookdars strongly objected to it also, as an innovation in the province, and as the creating of a new interest in the land; and I also maintained that the creation of any new right was barred by the terms of the title deeds, which expressly stated that the condition on which these estates were given to the talookdars was that all holding under them should be maintained in the subordinate rights which they had previously enjoyed; therefore no rights could

now

now be created against the talookdars which had not previously existed. The controversy was very warmly carried on on both sides, and was at last submitted to the Secretary of State, Sir Charles Wood, who put the issue as I think on a right basis. He admitted that no rights not existing before the annexation of Oude could now be created; therefore the question to determine was, Did the cultivators in Oude possess any rights of occupancy in the soil before the annexation of the province? and he directed an inquiry to be made to ascertain this point. That inquiry was held, and the report of the officer who conducted it, after examining 2,000 of the cultivators of the soil, was, that the cultivators in Oude never possessed any right independent of the will of the landlord, who exercised the fullest discretion to dispose of his land, or to let it to whom he pleased, and on what terms he pleased. This settled the controversy. Ultimately, in return for certain concessions made to the talookdars, they agreed that such cultivators as were members of the proprietary family in a village and had previously been in possession of land, not as cultivators but as proprietors, but had for some years past lost their proprietary rights, and were reduced to the position of simple non-proprietary cultivators of the soil, should have certain advantages in respect of rent; that is, that they should have a right of occupancy on terms below the competition rent. The talookdars having agreed to this, the consequence is that probably some 10 or 15 per cent. of the cultivators of Oude have a right of occupancy at rents more favourable than the tenants-at-will.

1918. Is that a permanent right of occupancy?—It is a permanent right.

1919. In perpetuity?—In perpetuity at rents somewhat more favourable than the rents paid by tenants-at-will; but the rest of the cultivators in Oude, the whole body of non-proprietary cultivators, barring those 10 or 15 per cent., hold their lands absolutely according to the terms of the contracts which they may enter into from time to time with the proprietors.

1920. Under what is, in fact, a tenancy from year to year?—Yes; and in that respect the position of the cultivators of the soil in Oude differs from the position of the cultivators of the soil in the North Western Provinces; for by the rent law every man in Bengal and the North Western Provinces who has been 12 years in occupation of land acquires a right of occupancy in that land, at what are called fair and equitable rates, or rates in the event of dispute to be determined by the courts.

1921. Is there not a provision, that if there is any express contract made, then that prevails?—Curiously enough the wording of the Act is, that holding with or without a lease for 12 years gives the right of occupancy. Of course that has been very much objected to by the landlords of Bengal, and very much objected to by a great many civil servants in India; and the courts have, perhaps, rather differently constructed the meaning of that. There was a great controversy on the subject in Bengal, and Sir Barnes Peacock gave a judgment on appeal leaning in favour of the proprietors; but that judgment was afterwards reversed by a full bench.

1922. What is now the final state of the law; is it that if a man has a holding for a fixed term, the general law supersedes the term?—

0.59.

The decision turned on what a fair and equitable rate meant; but as the law stands, any cultivator who is allowed to remain 12 years in occupation of land acquires a right of occupancy in that land; but then it is very easy to see how that can be defeated by the landholders, and how they do defeat it. They turn a man out before he has completed the 12th year; they will readmit him, but still they turn him out before he has completed the 12th year.

1923. But supposing that there is an express stipulation that he should give up the land at the end of 15 or 20 years, cannot such a stipulation be now enforced by law in Bengal?—I am not quite sure that it would.

1924. Do you mean that if he agreed to give it up at the end of 20 years, the law would not oblige him to do so?—Referring to a memorandum I have with me, I find that there is a section in the Act which provides that nothing shall affect any specific written engagement entered into by landlord and tenant. Therefore your view is correct. I must add that the law had retrospective effect, so that on the day when it passed every tenant who had rented land for 12 years acquired a right of occupancy in it, unless such right was barred by express stipulation to the contrary. But what I wanted to point out was, that the position of the cultivator of the soil in Oude differs from the position of the cultivator of the soil in the North Western Provinces, because in Oude he can by no length of permissive occupancy of the land acquire a right to cultivate it against the will of the landlord.

1925. Is there any other point on which you wish to speak?—I would say this, that with regard to the provision in the title deeds that all holding under the talookdars shall be maintained in the subordinate rights which they formerly enjoyed; of course to carry that out it was necessary to fix some term for the hearing of those rights, otherwise you might run back 100 years; and, therefore, the term of 12 years prior to the annexation of the province was adopted, 12 years being the term fixed by the general law of limitation in India for the hearing of suits as to rights in land.

1926. Sir D. Wedderburn.] I think in the celebrated Bengal rent case Sir Barnes Peacock stood alone in his opinion against that of the other judges?—Yes.

1927. Is it not the case that in Oude there is a much smaller proportion of Mussulman proprietors than in most parts of Hindoostan?—I see that the Mahometan population in Oude is 1,195,000 only out of 11,220,000. I do not recollect whether it is smaller than in the North Western Provinces; it is smaller than in some parts of the North Western Provinces. Reference to the progress report will show.

1928. I meant, more especially to speak of the talookdars?—Comparatively few of them are Mahometans.

1929. Mr. Beach.] Are the talookdars tolerably satisfied with their new tenure under the Government?—Yes.

1930. Is there not much rankling sense of injustice left from the previous confiscation?—No, I do not think they ever felt the confiscation, because when the proclamation of confiscation was issued, it was accompanied with an assurance that every man would find favour and be readmitted if he would tender his submission to

the

Sir C. J.
Vingfield,
 B.A.L., C.B.,
 M.P.
 15 April
 1871.

the British Government. At that time they were mostly in insurrection.

1931. Is the term that has been alluded to and praised by so many witnesses before, the 30 years' settlement, in your opinion a satisfactory one?—Yes; I think it is not a bit too long, but a very fair term.

1932. That is, a satisfactory term for the proprietors, and the revision of the 12 years gives a fair security to the cultivator under him?—I have always strongly contended that there is no necessity to interfere between the proprietors of land and the cultivators of the soil. I think that the cultivators are in a position to enter into a contract with the proprietor, for, although there is a redundant population in some parts, there is a deficient population in others, and the cultivator who has two oxen is welcome wherever he goes nearly. All that is wanted is courts of law that will enforce the conditions of the contracts on both sides, and those courts of law exist abundantly.

1933. Is the land cultivated generally in very small portions?—Yes. I see in the Punjab they say that the average holding of a cultivator is four acres. I do not know what it is exactly in Oude, but I do not suppose that it would be much more or less.

1934. *Chairman.*] Does that mean the actual cultivable land that is cultivated, excluding the pasture and other lands?—Yes; the tillage by a cultivating tenant is said in the Punjab to be an average of four acres; it may be five or six in Oude: I cannot say.

1935. *Mr. Beach.*] Is the general state of cultivation in Oude improving?—The cultivation was always very rich in Oude, but a great deal more land is cultivated now than used to be; and I think that more valuable crops are introduced. For instance, I should think that the area of land under sugar cultivation had doubled since it came under British rule.

1936. Your opinion, I think, is opposed to the permanent settlement?—Certainly; when Sir Charles Wood's rules came out I was asked my opinion about making the settlement permanent in Oude, and I did not enter into the question, because I said that it was quite premature to talk of a permanent settlement before you had even made a 30 years' settlement.

1937. And you are opposed also to the redemption of the land revenue?—I am opposed to the redemption of the land revenue. I think that if Government had got so much money, and after paying off their debts still money kept pouring in from the redemption of the land revenue, they would be very likely to waste it.

1938. *Mr. Fawcett.*] Although of course you are most intimately acquainted with the land settlement in Oude, I have no doubt that you have considered the general subject of the land revenue throughout India?—Yes; I was for 14 years in the North Western Provinces as a collector of land revenue, and in fact my knowledge and experience in regard to the land revenue was chiefly gained in the North Western Provinces.

1939. Do you agree with the opinion which I believe has been lately expressed by Mr George Campbell, the Lieutenant Governor of Bengal, that in the next 10 years, say, 20 years, until the new settlement, there is little prospect of the land revenue very much increasing?—The land revenue cannot increase till the term for which it has been fixed expires.

1940. Therefore, speaking generally, if that term will not expire throughout the greater part of India, for 20 years, and if the land revenue in other parts is permanently settled, there is little expectation of there being any increased revenue to a considerable amount from the land revenue for the next 20 years?—You must bear in mind that the leases do not fall in all at once. Some would fall in this year, and some a few years hence. The increase which results from re-settlement will be diffused over 30 years.

1941. It will not be anything considerable for some years, will it?—It depends how many leases fall in annually.

1942. Have you ever formed in your own mind any estimate of what is likely to be the increase in the next 10 years?—If prices continue to rise, and rents with them at the rate at which they have been rising during the last 20 years, in every re-settlement there must be an increase.

1943. But to arrive at this point it would be necessary, of course, to form an estimate of how much land would be likely to be re-settled during the next 10 or 15 years; could you do that?—No; because I should have to know the date of every settlement in the Upper Provinces. I can tell you, for Oude, that every settlement of a district has been made within the last seven years, and some districts have not been settled yet. Therefore in Oude, no district can come up for re-settlement in less than 23 years, and some perhaps not for upwards of 30 years.

1944. Therefore during that period there can be no increase in the land revenue?—There can be no increase.

1945. Have you formed any estimate on what seems to have a most important bearing on the land revenue, namely, the rise in prices during the last 20 years?—I have not got any tables showing that by me at this moment; but I know from the reports when I was in Oude, the reports of the collectors, and from what I have read in the papers and learned from conversation that the rise in prices and the rise in rents has been very great everywhere.

1946. I have seen various estimates given. Of course I only ask you for a general opinion. Should you say that it was an exaggeration to state that there had been a rise of prices of 50 per cent. during the last 20 years in India?—I should hardly think that an exaggeration in many parts of India.

1947. Then of course if there has been that rise in prices, that is tantamount to saying that there has been a corresponding depreciation in the value of silver?—No doubt; a rupee does not buy now what three-quarters of a rupee bought 15 years ago.

1948. Therefore, that being the case, if now we find that we are obtaining 20,000,000 l. from land revenue, and if we were obtaining 20,000,000 l. 10 years ago, although the land revenue is not nominally decreased, yet in reality it is decreased by 50 per cent., because it represents so much less value, does it not?—But you must recollect this; that when we settled the North Western Provinces, between the years 1803 and 1840, we went on the principle of taking two-thirds, that is 66 per cent. of the assumed rental of the proprietor. When we re-settled the North Western Provinces at the expiration of that settlement, which was for 30 years, we then took only 50 per cent. That accounts for there not having

having been so great an increase in the North Western Provinces.

1949. I quite understand that, but that is not exactly the point that I am wishing to get at. I will take a figure; I will say, for instance, that in 1862 (and I believe I am not very incorrect); the land revenue was put down at 19,000,000 £. Now, supposing it was put down at the same amount in this year, if there had been no change in the value of silver, of course the land revenue would represent the same value in the two years, but as there has been a depreciation in the value of silver, although there has been no nominal reduction in the value of the land revenue, the land revenue has really decreased to an extent proportionate to the depreciation in the value of silver, which you estimate at 50 per cent.?—But the land revenue cannot have decreased, because, whatever the assessments were they have been paid; and if it has not increased proportionately to the fall in the value of money, the only reason is that districts have not come under re-settlement to a sufficient extent, or that when they have come under re-settlement we have taken a less proportion of the rent than we did formerly.

1950. Suppose that I let an estate for 50 years, at 1,000 £ a year, I get a fixed income of 1,000 £ a year for 50 years. Suppose that during that time the value of money depreciates by 50 per cent., then at the end of 50 years the rent, though nominally the same, because I receive the same rent as I did at the beginning, to me is really 50 per cent. less valuable than it was before?—That would be so.

1951. Then, considering that the Government of India uses its land revenue for purchasing commodities and so on, if the money which represents that land revenue depreciates in value, surely it is the same thing as saying that the land revenue is depreciated?—The land revenue does not give you the same value as it did before; and that was Mr. Mangle's strong argument against a permanent settlement.

1952. When you say that you consider that there has been a depreciation in money to the extent of 50 per cent., and that the land revenue remains about the same amount, the wealth represented by the land revenue yielded to the Government of India has really been depreciated to the extent of nearly 50 per cent., has it not?—It has been depreciated no doubt in that way; but, as I say, that depreciation where the lands are not permanently settled will be redressed when you come to make the next settlement; because as prices rise and the value of money falls, rents are affected and become higher; and the Government's share of the rent is increased. Undoubtedly your money does not buy you so much; it does not go so far in paying your troops and your establishments as it did.

1953. This serious depreciation, which has really gone on in the wealth represented by the land revenue during the last 20 years, and which is going on at the present time in consequence of the continued depreciation of money, cannot, as it were, be set right or re-adjusted until there is a new settlement, which you say, as far as the North Western Provinces are concerned, will not be for 25 years?—No, I said that as regards Oude. In the North West Provinces the leases are dropping in gradually.

1954. Then if there is a depreciation in the value of silver, or, in other words, a steady rise in the price of all commodities, contemporaneously with

that rise the money liabilities of the Government, so far as those liabilities consist in paying wages, in purchasing commodities, and in providing food for the troops, must increase, must they not?—Yes.

1955. Therefore the point I want to get at is this: that owing to the depreciation in the value of silver, the expenditure of the Government, or in other words their annual money outlay must constantly increase, and that great source of revenue, the land revenue, must be at the same time being really depreciated?—Of course that is the result during the term of the settlement; if the settlement is perpetual, then it is lasting.

1956. Then during the next 20 or 25 years (which represents the period during which over the greater part of India there cannot be a new settlement to a very considerable extent) this very serious financial position is presented to us, that the land revenue, which is the only source of revenue which does not represent onerous taxation on the people, is constantly being depreciated in value, whereas the money expense of the Government must constantly increase?—That is true, no doubt. All I can say on the other hand is, that the correction of it will come.

1957. In 25 years?—In a great many parts of India, in Madras, for instance, they are making their settlements now, and they will get the benefit of the rise in prices now. They got the benefit of the rise in prices the other day in Bombay. In the North West Provinces they are gradually getting it. In Oude we shall not get it for a long time. In Bengal they will never get it at all.

1958. But do you not think that the fact which I have just stated, is one chief cause of the very serious financial position of India at the present time; namely, that during the last 20 years there has been a steady and rapid rise in the expenditure of India, whereas the source of revenue which was most important, namely, the land revenue, has proved itself during that period inelastic?—No doubt that is a drawback, and has been a source of embarrassment to the Government; but then you must recollect this, that owing to the rise of prices, although the land revenue may have been from particular causes stationary, yet other sources of revenue have improved very much, such as salt and customs.

1959. But do not you, as a financier and an economist, draw a fundamental distinction between revenue derived from land and revenue derived from taxation, such as salt duty or customs?—Of course; the land revenue of India represents the inherent right of the Government to a portion of the produce of the soil.

1960. And other kinds of taxation represent the necessity of the Government to take away from the people a portion of their industry, do they not?—Yes.

1961. Suppose the Government did not own any land revenue at all in India, the great mass of the cultivators would not be one iota less heavily taxed; the only difference would be, would it not, that instead of paying a revenue to Government, which may be used for the general advantage of the country, they would pay revenue to some other proprietor; therefore you cannot say that revenue paid for land impoverishes the great mass of cultivators?—Certainly not. I have always held that if the Government of India were to give up the land revenue the country

1871.

country would be no better for it; the proprietors would get careless and indifferent, and the cultivators would not have the stimulus to exertion of high rents; and I may mention that in most districts in India there are villages held free of revenue under the grants of the former sovereigns. Now, I have never heard it said, and I never observed that the cultivation in those villages was one whit better than in the neighbouring villages that paid land revenue.

1962. Agreeing entirely in that doctrine, let me not ask whether you might not briefly put it in this way: that revenue raised on the land represents no loss to the community, whereas revenue raised by such a tax as salt or import duty, represents a real burden on the people?—Yes; I have always agreed with Mr. Mill, that a revenue derived from land, that is to say, the Government share in the rental of land, is the most unobjectionable way of getting the means of carrying on Government.

1963. Then I come to the point which I think so particularly important to establish, which is this, that that source of revenue which represents no burden to the people of India is constantly, in consequence of the depreciation of silver, being reduced in value, and as the result of that, in order to make up the deficiency, we are constantly obliged to impose new taxes on the people, which represent real burdens?—You are.

1964. And that represents a very serious financial outlook, until we have had a new re-settlement which will readjust the depreciation of the value of silver?—Yes; but if you want to deduce from your argument the conclusion that Government should not make long settlements, then I differ, because that progress, that rise in prices, that rise in rent, that prosperity, would not result from short settlements.

1965. I fully appreciate the advantages of long settlements, but it struck me in this way, that the disadvantages which I point out as resulting from these long settlements, and especially from permanent settlements (of course there the disadvantage is absolute and complete) may, without losing the advantages which undoubtedly result from a settlement of 30 years, be to a certain degree got over, if you take the land revenue not solely in money, but estimate it partly by the value of produce?—That has often been suggested, but the people would not understand it, they would say, "Let us know definitely what we have to pay." It is the feeling of security that for 30 years, or for however long you may fix the settlement, a man shall enjoy exclusively the fruit of his exertions, that encourages the improvement of cultivation and the reclamation of waste.

1966. Then you think that, owing to the peculiar feelings and ideas of the Indian people, it would be impossible to get over the difficulties associated with the gradual depreciation of money by making the revenue of land not simply a money rent, but also a rent estimated by the value of the produce?—Certainly; I never approved of that suggestion.

1967. Then, unless you abandoned the advantages of long settlements, which seem to me extremely undesirable to abandon, there is no way whatever of getting over this loss to the Government, which results from the depreciation in the value of silver?—No, except by other modes of taxation.

1968. Then, considering the financial case

which I have just presented, and this state of depreciation in the value of the land revenue, we should probably draw this moral, that it is of the utmost importance that there should be the greatest possible economy in the administration of the finance of India?—Yes, certainly.

1969. Has there been, to your knowledge, much waste land sold in Oude?—Waste land to the value of nearly 90,000 £ has been sold, but I may mention that prices at the auction sales ran up to preposterous heights. There was, at that time, a rage about reclaiming waste lands. Speculators, principally Europeans, fancied that they were going to grow cotton, and tea, and all sorts of valuable products, and they ran up the prices of these waste lands to preposterous heights. The consequence has been, both in Oude and in Bengal, that when that speculation subsided they could not pay the money, and they have been obliged to ask the Government to take back half the land, perhaps, or a great portion of the land, and let them off the purchase-money.

1970. Can you throw any light on the point upon which I have tried to obtain information from so many witnesses as to how the proceeds of these sales of waste land have been appropriated?—They were carried to a separate account in the Government treasury, and were afterwards, I believe, (I think I saw it explained in the Budget), credited to land revenue.

1971. They were credited to land revenue, and therefore came into the income of the year?—For a long time they were kept as a separate account in deposit; but I have a distinct recollection of seeing it stated in one of the Budget statements that they were carried to the land revenue.

1972. Then the Government actually adopt this extraordinary principle to sell their property at the same time that they are borrowing money, and instead of devoting the money derived from the sale of their property to the reduction of debt, they put it into income?—It appears to me that they have done so. I have almost a distinct recollection of seeing the explanation in Sir Richard Temple's statement, that the land revenue of the year had been swelled in that way.

1973. Supposing that that has been the case, do not you think that, as a financial expedient, it is absolutely indefensible?—The sum, you know, is not very large. It would be more correct, no doubt, to have applied it to the reduction of debt; but, then, what is the use of reducing the debt a little when you are incurring fresh debt.

1974. But this is only an instance, I believe, of what has taken place on a considerable scale. As a matter of principle can you suggest, as a financier, anything more indefensible than that the Government, while they are actually borrowing money should sell property and devote the proceeds, not to the reduction of debt, but to income?—I should say that it was an incorrect principle.

1975. Can you give me any information as to a point on which I asked some questions of other witnesses, namely, as to the khas mehals?—The khas mehals, known by that name, are confined to Bengal. In Bengal a great deal of land under the perpetual settlement was brought to sale for arrears of revenue, and whenever it would not fetch the balances on it by sale the Government bought it up at a nominal sum and then managed these under their officers; but it merely means a private estate, that is to say, the private

private estates of the Government, all the proprietary rights having been bought out. In almost every district in India there are, or were, a few estates that are the private property of the Government, perhaps at the time of settlement no proprietor has been forthcoming, but the general policy of the Government has been either to sell the proprietary rights of these estates or to give them away in the Bengal Presidency.

1976. Then we may define a khas mehal as a private estate owned by Government, which they have no idea of permanently keeping?—They did keep these khas mehals for a very long time in Bengal, because they improved them very much when they had them under their own management; but ultimately they disposed of them.

1977. What you say is, that in many instances these khas mehals, or private estates owned by the Government, have been sold?—Yes, I think that they have been sold in Bengal, but in the North West Provinces very often they were given away; that is to say, settled with the cultivating body. I have had a few, but I never sold them.

1978. But have not you, who have studied the accounts of India so very much, seen put down in several instances this item: "Sale of khas mehals;" in other words, sale of these private estates owned by Government, so much?—I cannot say that it ever attracted my eye, but I know that some were sold in Bengal.

1979. Should you not consider it in the same light as appropriating the sale of waste lands to income; should you not think it absolutely indefensible to appropriate the proceeds of the sale of these khas mehals to income?—I think it stands in a different position, because the Government in selling the proprietary right does not sell anything that is the inherent right of the Government; it was a mere accident that the Government became possessed of the proprietary right in these lands; otherwise the proprietary right is recognised to belong to the people, to the proprietors.

1980. But this is the point I want to get out; having got possession of these private estates, I do not object to their sale of them, that is a mere question of policy; but supposing they had kept them in possession, those estates, as long as they had been kept in possession of the Government, would have yielded an annual revenue, would they not?—So they do now, because you only sell them subject to the payment of land revenue.

1981. But if they had kept them, and not sold the proprietary right, it surely would have yielded a larger amount to the land revenue?—Yes; because Government would then have been in the position of the proprietor, and would have got the proprietor's rents; whereas, after they have sold them, they only get the proportion of the proprietor's rents which Government gets as land revenue. Then you must recollect, on the other hand, that it is a very troublesome thing to manage these estates; that an establishment must be kept up. If the Government stands in the place of the proprietor, it must have somebody in the village to superintend the cultivation, to arrange for the collection of the rents, and to attend to all the duties that attach to landed property. No collector likes to have an estate thrown on his hands, for the reason that it involves so much trouble.

Q.59.

1982. I am not venturing to object to the policy of selling these; the point I wish clearly and distinctly to bring out is this: suppose the Government which owns one of these khas mehals, lets it for 100 l. a year, then 50 l. a year of that represents the land revenue, and the other 50 l. represents the proprietary right; if the khas mehals are sold the Government does not sell the first portion which represents the land revenue, but they do sell the capitalised value of the second portion which represents that proprietary right?—Yes.

1983. Therefore for ever they deprive themselves of this source of income?—Yes.

1984. If that is the case, can you conceive a more indefensible way of managing accounts than to put a sale of permanent revenue to income at the same time that the Government is borrowing money?—As I have said already, I see a distinction between selling the waste land free of all demand for land revenue and selling the proprietary right, because the land revenue is the inherent right of the State; but in selling the proprietary right you sell a thing that has accidentally come into your hands, that is not an appanage or right of the Government, and a thing which you do not want to keep, but rather to get rid of.

1985. I am objecting to the appropriation; my point is simply this; governments after all ought to be compared to individuals in regard to the matters?—You mean that the Government should not have treated the proceeds of the sale of the proprietary right as income. Perhaps it would have been more appropriate to have regarded them as capital and to have spent them in reducing the debt; but you must recollect that it was an accidental possession of property, and it will not go on increasing. There is no great probability of the proprietary right of more land being thrown into the hands of the Government.

1986. That strengthens my case greatly: is not that all the more reason why they should have devoted them to capital and not to income?—I look upon them as a windfall.

1987. But would not an individual be considered an absolute spendthrift, if after extra expenditure had been incurred by him, every windfall he happened to get he spent on his income instead of reducing his debt?—It would have been more correct perhaps to have treated it as capital; but I do not see, considering what an exceptional receipt it was, and, as I said before, not one that any Government has any right to expect, that it is anything more than a matter of comparatively trifling importance.

1988. When this order relating to the permanent settlement was sent out by Sir Charles Wood, did many of the officials who held views like yourself strongly oppose the permanent settlement and object to it; had you any power of objecting to it?—Yes; the opinions of the governors of provinces were asked, and I have no doubt that all of them did give their opinions. If I recollect right, Sir Donald Macleod, the Lieutenant Governor of the Punjab was opposed to it; he rather favoured the idea of a permanent settlement on the basis of prices, I think. In the North Western Provinces, Sir George Edmonstone, who was Governor then, objected to it.

1989. Do you know a single official person who approved of it; have you ever seen any approbation of it from any of the governors of provinces?—

Sir C. J.
Wingfield,

1871.

vinces?—No, except Lord Lawrence's minute, that you are all familiar with, and some minutes by Sir W. Muir. I think that the man who revived the idea of this permanent settlement so strongly, and was such an enthusiast for it, was Colonel Baird Smith, the Superintendent of Canal Irrigation; I think he rather gave it the impulse.

1990. *Chairman.*] Was that on his Famine Report?—On his Famine Report; I know that he was a strenuous advocate of it. His idea was, and it is very much dwelt upon by all who favour the permanent settlement, that once fix the Government demand for ever, and the people will get so rich, that a thousand new sources of taxation will present themselves to you.

1991. That assumes that indirect taxation is the most excellent mode of taxing people?—Yes; and that sources of indirect taxation will present themselves in any number if you only settle the land revenue in perpetuity.

1992. *Mr. Faucett.*] Does not experience show that they dislike the new taxes?—There is no province in India in which there has been so much opposition, so much reluctance to submit to anything like direct taxation, to an income tax, or any of these new imposts, as in the permanently settled province of Bengal.

1993. In fact, it would not be incorrect to say that of all the people in India, those who most object to the imposition of the income tax are the very zemindars of Bengal who have most profited at the expense of the Government by the permanent settlement?—Yes; but perhaps the reason that they objected more strongly than others was, first, that they considered that to levy an income tax from them was an infraction of the express terms of the permanent settlement, and then, secondly, that high education is more general there, and that all the intelligence and wealth of Bengal is concentrated in Calcutta.

1994. You would be in favour, I suppose, of having this order of Sir Charles Wood's with regard to the permanent settlement, rescinded?—Certainly; I think that no time should be lost in rescinding it, because in the meantime it is being acted on.

1995. You think that even each year's delay in the matter is a serious thing for the future finance of India, so far as it is brought into operation?—Yes, certainly; every year that the perpetual settlement is being carried on it is evil, in my view.

1996. *Mr. J. B. Smith.*] I think you stated the income of Oude from the land revenue to be about 1,300,000 *l.* per annum?—Since I stated that I have got the Budget estimate for 1870-71, and I find there that the land revenue for the year ending March 1871 is 1,331,000 *l.*, that is putting it at 30,000 *l.* more than I did for the previous year; but that is land revenue, not total revenue.

1997. Is the land revenue in Oude sufficient to pay the total Government expenditure?—I do not know that I could give that from the accounts, because there is the cost of the army, which is charged to all India, and not debited to the different provinces; excluding army charges there is a great surplus revenue.

1998. I think you stated that the depreciation of silver has had the effect of diminishing the value of the land revenue of the Government. Supposing the decrease in the value of silver to be 20 per cent., there has been in effect a loss of 20 per cent. to the Government revenue?—

That is to say, by diminishing the purchasing power of the land revenue.

1999. But will it have that effect on the Government funded debt. The sum which it receives from the land revenue in silver will pay off the same amount of debt; if it receives a thousand rupees in silver it will pay off a thousand rupees of debt contracted to be paid in silver or of interest, will it not?—Certainly.

2000. In that case then there is no loss to the Government?—You mean that, whereas the Government has to pay dearer for what it buys, its payments of debt remain the same. That is so.

2001. But in no other instance?—Debt or salaries.

2002. Are not salaries raised in consequence of the depreciation in the value of silver?—I believe in Bombay they were when there were those enormous prices of cotton; that affected all prices in Bombay, and they did raise the salaries of some public servants there, but I have never heard of the salaries of public servants being raised on the Bengal side of India on account of the increased expense of living.

2003. You are aware that the value of silver has lately risen, that is to say, that a rupee which passed for 2 *s.* 1 *d.*, at one time during the great demand for cotton has fallen to 1 *s.* 10 *d.*?—Yes, that is the exchange; but still the purchasing power of the rupee is not what it was in India.

2004. I want to know whether there has been any change in the rate of wages or the price of commodities since that increase in the value of the rupee?—Yes, certainly, everybody knows that; he pays everyone of his servants more than he did 20 years ago.

2005. But I am speaking of this particular period: this happened during the cotton famine; the rupee rose from 1 *s.* 10 *d.*, to 2 *s.* 1 *d.*; the price of cotton rose enormously, and the price of land, and the price of provisions rose. But what has been the effect since the rupee has fallen from 2 *s.* 1 *d.*, to 1 *s.* 10 *d.*?—It does not appear to have had any effect in Upper India. I never heard that the value of the rupee there was affected by the English exchange.

2006. You are aware that the price of cotton has very much fallen?—Yes; that is in consequence, I presume, of the larger supply from America.

2007. And has the price of other commodities in any respect risen in India?—Having been five years away I do not know that I am in a position to state that positively.

2008. You have not formed an opinion on the rise in the price of commodities occasioned by the depreciation of silver?—I only know from what I hear from India, from what I read, and from what was taking place when I left, that everybody complains that living in India is very much dearer than it used to be; and there is no doubt of one thing, that the prices of grain have ruled much higher for the last 15 years than they did before, and rents have risen.

2009. But having regard to the extraordinary rise in cotton occasioned by the cotton famine in America, does it follow that the price of silver has been depreciated in consequence of that great demand for cotton?—I should think that the depreciation in the value of silver began when so much silver was poured into India to make the railways;

railways; long before the cotton famine in this country.

2010. But was it not very much increased by the cotton famine?—Yes, but that was more about Bombay, and did not extend so much to the east of India.

2011. Are you aware that the imports of silver into Bombay were increased six to seven-fold during the cotton famine?—I know they were in Bombay, but I think the effect of that was not so very much felt in Bengal; the further you got from Bombay the less it was felt, because in the non-cotton-producing districts it would be relatively of course less felt. For instance, in Oude, which is not a cotton-producing district, I never heard that it made much impression, the rise there has been gradual.

2012. Sir T. Bazley.] Where, in Bengal, and in the North Western Provinces, the tenants have occupied their land without interruption for a period exceeding 12 years, have they acquired any proprietary rights, or merely a permanency of occupation?—Merely a permanent right of occupancy.

2013. And they are liable to an increase of rent, or a reduction of it, according to the change in the value of land?—Yes; they can sue by civil process in the courts for a reduction if they can show cause for it; and if they object to any enhancement that the landlord proposes, the landlord must bring a suit in court to get the rent enhanced.

2014. And whilst they have the power of retaining their holdings, they can retire from such holdings if they choose?—Yes.

2015. Mr. Lyttelton.] You say that in spite of the depreciation in the value of money salaries have not increased?—I do not know. In Bombay they increased them, because the rise in prices was so enormous there that people could not live on their incomes. You could not get a single room to lodge in under a fabulous sum; but there has been no increase in salaries in the Bengal Presidency that I am aware of, owing to the rise in prices.

2016. But the rise of prices continues, and will before long reach that point at which it will become absolutely necessary to raise them, will it not?—The salaries of the civil servants are generally very liberal, and there is a good margin.

2017. In course of time, you cannot deny that they must be raised?—That may be a logical consequence. I say that the salaries of civil servants being liberal, people do not complain; they know that there is ample margin left to live on and to save out of.

2018. Do not you think that it adds to the gravity of the financial prospects, when we consider the probable increase in the salaries of the civil servants?—It is a feature that cannot be left out of sight, of course.

2019. In similar circumstances in England, I think, we should find that we should have to pay increased salaries?—I think I may say that the salaries of the native employés of the Government have been in many parts raised, but that was because they were so utterly inadequate before.

2020. With regard to the regulations which Sir Charles Wood sent out in 1862, as far as we can ascertain from the evidence that we have had, they have only been acted upon in the North Western Provinces; can you state, from your general

knowledge of India, whether that is the case?—I am sure that they have only been acted upon in the North Western Provinces.

2021. How is it that an order from the Imperial Government, which is applicable to the whole of the empire, is only acted upon in a small fraction of that empire?—It could not have been applicable to the Madras Presidency, nor do I think that it was applicable to the Bombay Presidency; it was applicable to the Bengal Presidency. A discretion must have been left to the Governor General, on the representation of the local governors, to expedite or to retard the execution of the order. Then, again, there was one condition, that 80 per cent. of the culturable area must be actually under cultivation. Then another condition was, that it was not to extend to any villages or tracts of country which were likely within 20 years to be brought under canal irrigation; so that all those conditions excluded a great deal of land from its operation.

2022. It was the imposing of those conditions which prevented its application to the Punjab?—Yes.

2023. And in Oude?—In regard to Oude, I mentioned that I was asked my opinion, and I said that it was premature to talk about a permanent settlement in a country that had not been surveyed; that until the settlement that was in progress of being made for 30 years was completed, I could not conceive the entertaining of the permanent settlement at all.

2024. In consequence of your representations, the minute was practically inoperative in Oude?—I think that, even apart from my representations, the idea of extending it to a country in which a regular settlement had only just been begun could never have been entertained.

2025. Mr. Grant Duff.] Was I right in understanding you to say the other day that when the settlement that is now in progress in Oude is completed, we shall have about 200,000 *l.* a year more land revenue than we have shown by the latest statement?—Yes, I have now a still later report that raises the land revenue to 1,330,000 *l.* I estimate the ultimate result at 1,500,000 *l.*

2026. So that there is 170,000 *l.* that we have still to receive when the present settlement is completed?—That is only an estimate of mine; it may be 50,000 *l.* less or 50,000 *l.* more; but I do not think it will be 50,000 *l.* more.

2027. Is the description of Oude before annexation given by Sir William Sleeman a pretty correct one?—No; I have always differed very much from Sir William Sleeman's account. It was, I think, a partial account; he was very much under the influence of some natives; he had been a very eminent man in his day, and had gained his reputation in suppressing Thugs and Dacoits. It was a fashion in Oude whenever a talookdar quarrelled with the Government to brand him as a Dacoit, and it was known to be an easy way of getting Sir William Sleeman's support to tell him that such a talookdar was a Dacoit; he at once was loud against him.

2028. You think his picture of Oude was too gloomy?—I think it was overdrawn; but what he says of the north of Oude having been terribly desolated and oppressed by one of the native governors was perfectly true.

2029. But, making all allowances for exaggerated statements in his book, nevertheless you think that, under our rule, Oude has very much improved?

Sir C. J.
Wingfield,

1871.

improved?—Enormously, by the security that has been given to peaceful industry. I recollect when we entered Oude, when I marched to take possession of my jurisdiction you never saw within half-a-mile of either side of the high road any cultivation at all, because if there had been any crops there the armies of the Government, or the armies of the talookdars fighting one

another would have trampled them all down or eaten them up.

2030. The annexation was only 15 years ago?—Yes.

2031. And now it would be true to say that it is one of the most peaceful, one of the most contented, and one of the most prosperous districts of India?—Yes.

Mr. CHARLES BAGOT PHILLIMORE, called in; and Examined.

Mr. C. B. 2032. *Chairman.*] WILL you be good enough to state what has been your employment in connection with the Forests of India?—I have been assistant in the Revenue Department since 1855, at first in the Board of Control and in the India Office since the amalgamation of the two offices.

2033. Has your attention been particularly directed to the question of the forests?—Particularly so.

2034. Will you be good enough to state when the Government first applied itself to the administration of the forests as a source of revenue?—The forests were very much neglected for a great many years, and accounts of neglect are constantly met with in the correspondence; but I think that the first time was about 1800, when the Court of Directors wrote to India to desire that the Government should assert the Royal rights which had been asserted by the native princes over the forests of Malabar, and which had been neglected by our Government. In 1830 there was a great complaint made by the Indian Navy Board of Bombay as to the want of timber, and they urged upon the Government the appointment of a conservator. In 1832 there was evidence given before the House of Commons, by a Dr. Wallpic, of the neglected state of the forests, particularly in Malabar and in Bombay, and he also strongly urged measures of conservancy. The neglect went on to a still later period, and Sir Robert Grant, I think, in 1838, took up the question; and in 1846 Dr. Gibson was appointed to Bombay, and did a very good work there for many years, though he had not much help. Then in Burmah, Mr. Colvin, in 1841 I think, was the Chief Commissioner in the Tenasserim Provinces, and took up the forest question earnestly. Dr. Falconer was specially employed there, and obtained considerable celebrity by a report which he wrote. Then Mr. Brandis, a German by birth, was appointed in 1855, and was desired by Lord Dalhousie to institute measures of conservancy. He is a man of great ability and great power of organisation, and of indefatigable labour, and rendered very good service in the Burmese Provinces after Pegu had been added to them. About the same time, at the end of 1855 or the beginning of 1856, the Madras Government (Lord Harris's) took up the subject very warmly, and both Lord Harris and Sir Henry Montgomery wrote minutes on it, and they called upon Dr. Cleghorn to organise the department there. I may say then that Bombay, Burmah, and Madras were the first places where conservancy began. Some correspondence arose between this country and the Governor General of India about the cession of the forests to the west of the Irrawaddy, which had been imprudently given up to permit holders (that is to say, persons who were allowed to cut as long as they paid a certain royalty). The Secretary of State wrote out a Despatch

strongly urging conservancy, and the Government appointed Mr. Brandis and Dr. Cleghorn to consider how they could form a separate department to organise an administration for all India. That was in 1863, and from that date I think we may say that the administration has gone on improving; that departments have been formed in all the great provinces which are under conservators, with deputy conservators and assistant conservators under them, and that, in short, an organised system is now instituted.

2035. Can you state generally what are the forests in India now that have been brought under conservancy under the new system?—There are the Punjab forests; deodar and other pine forests in the hills of that province.

2036. Can you give us any idea of the area of these forests?—It is very difficult to do so, because they are very extensive. They are not demarcated in the Punjab, and I could not give any estimate of those; but in the Central Provinces, they are about 21,000 square miles; in Burmah they are about 2,400 square miles; and the Assam forests are 4,000 square miles. I heard from Mr. Brandis the other day, that the forests in the North Western Provinces and Bombay and Madras were not demarcated.

2037. What is the nature of the forests, and their character generally, in the Punjab?—They are chiefly deodar and pine wood.

2038. And in Oude, what are they?—I think *sāl* chiefly. In Assam there are very valuable forests of cautehoun. In parts of Assam there are the Soom forests which are much valued for silk worms. There are also *sāl* forests in Bengal. In the south you get the teak, which is the really valuable property. In Burmah there is very valuable teak, but it has been very much ransacked. The Attaran forests were the first made use of in the Tenasserim Provinces, and they were quite ruined for want of conservancy.

2039. In regard to the North Western Provinces, are there any forests there?—Yes, some very valuable forests there.

2040. Of what timber?—I believe all the *sāl* to be very valuable; and, of course, there are pines in the hill districts of the Himalaya.

2041. And in the Lower Provinces of Bengal, what forests have they?—They have *sāl* there.

2042. And in Madras?—They have in Malabar teak and other woods; they have ebony, and they have also sandal wood which is very valuable.

2043. And in Bombay, what are the forests?—They have teak there also. The Bombay forests are so large now, since the addition of the valuable forests of Canara, that the Government have been obliged to appoint two conservators. Part of the Canara forests were taken off from Madras, and given over. They are extremely valuable; the teak there is magnificent.

2044. What character are the forests of the

other part of the Bombay Presidency?—They contain teak too.

2045. Are there forests in Seinde?—Yes; not with such large timber, but they are chiefly required for fuel for the steamers on the Indus.

2046. They are consumed locally then?—Yes, but I think there is also an export to Bombay from Kurrachee; I am not positive however on that point.

2047. Is the establishment for the management of these forests now completely organised?—It is being added to; Madras has not been re-organised; but I believe it is under the consideration of that Government to make proposals to the Governor General on the subject. The scheme has not yet been sent home.

2048. Are natives chiefly employed in the establishments or Europeans?—The subordinate places are filled by natives. It is intended, as soon as it can be managed, to employ the educated natives of high families, who would be glad, I believe, to serve in the forests, but at present they have no training or aptitude for the work. When there is a forest school in India, which is the object that the Secretary of State and the Government of India have in view, it will be possible to train the natives.

2049. Are you sending out skilled men now?—The Secretary of State is training young men now on the continent of Europe, in France and Germany. The governments of those two countries have been very kind about it, and the system as yet is answering extremely well. The young men get on very well with the authorities and with their comrades. Those that have been sent out have not been out two years, but they have been spoken well of up to this time. The young men are sent to the Continent for 2½ years, and then go to India.

2050. What has been arranged for the methodical administration of these forests for the purpose of producing revenue; have they been classified?—They have been divided into reserved and unreserved, the reserves being those from which everybody, except the Government officers, are excluded, but cuttings are allowed in the unreserved ones, with the permission of the department. There are also forests which have been appropriated to the villages in some cases.

2051. Do you mean whole forests?—Certain districts and jungles given over to them for the wood, to which they have, by custom, a right to make their implements, and to procure leaves for manure and twigs to burn.

2052. But with regard to the reserved and unreserved, are there general rules under which licenses are granted to cut timber?—Yes, in the unreserved there would be. It is differently managed; in some places it is done by a seignorage, but the orders are so soon as the forests are fit for it, to get them under departmental management. In some districts the establishment is not large enough, and it would be too expensive to do it all at once; but gradually it is intended to get them all under actual organisation.

2053. In what way is the produce of the reserved forests reserved?—By preserving the timber for the use of the people; it is reserved by the Government in order to stop the entire destruction of all the forest.

2054. In order to allow the timber to grow to a proper marketable size?—Yes.

2055. The timber in those reserved forests

having been cut down already?—Yes, in a great many; and, where the forests have not been ill-used, the object is to preserve them, and to deal them out according to regular rotation and regular management.

2056. But you are not able to state now what is the extent of the forests?—No, it would not be safe at all to do so. I thought that question would be asked, and I tried very much to make it out; but any statement on the subject, I think, would only mislead. When the forests have been surveyed and demarcated, we shall know better what the area is. Even then, I suppose, they are so extensive that we may not know very accurately.

2057. Is it supposed that according to the present extent to which the forests are being used, the reserved forests will produce timber to be taken up at the time when the unreserved are exhausted?—Yes, certainly; but I might mention that the reserved are not so reserved as that they are not cut by the Government officers. The Government officers still cut in the reserved forests according as the timber is required.

2058. Do you mean required for the purpose of Government?—Required for the purpose of Government, or for the purpose of keeping the rotation of the forest; the trees that are fit for cutting are cut.

2059. When they are cut in that way, are they sold and brought to account as revenue?—Yes.

2060. Will you state by what mode the revenue is collected from the public who are allowed to cut timber?—Sometimes by licenses, and sometimes by a royalty upon the timber brought out of the forest, a seignorage.

2061. And are these demands and payments regulated administratively and not by any legislative enactment?—There is a legislative enactment, which is to be amended; but it does not deal with that point; it only establishes the right of the Government to do certain acts in the forests.

2062. Does it prevent the public from going into the forests without the license of the Government?—Yes, it does.

2063. Can you tell us what has been the revenue derived from the forests by the system of licenses and otherwise?—I cannot give you what has been got by one and what by the other; but in 1863–64 the gross receipts of the forests were 304,443*l.* for the whole of India. I take 1863–64, because it was the first year that the forest revenue was not mixed up with the sayer duties; they were put together before that date. But in the Budget estimate that we have now for 1871–72, it is estimated at 573,220*l.*

2064. Have you any classification of that revenue in the different forests, or the different presidencies?—We ought to have such a classification, because there is always a separate annual Budget prepared for each administration.

2065. Has the increase been gradual?—It has been gradual I should say; in one year it was a little less than in the previous year, but otherwise it is a gradual increase. It has been 304,000*l.*, 350,000*l.*, 356,000*l.* (this official year comprised only 11 months), 301,000*l.*, 331,000*l.*, 420,000*l.*, 458,000*l.*, 468,000*l.* (regular estimate), 573,000*l.* (budget estimate), so that you may certainly say that it is a gradual increase.

2066. Have you ascertained the causes of that increase?—I have no doubt myself that the causes

Mr. C. B. Phillimore.

25 April 1871.

Mr. C. B.
Phillimore.

25 April
1871.

are the better management of the forests, and that they have produced more.

2067. Do you mean that more timber has been cut in the forests, or that the charges have been raised for cutting the timber?—I do not believe that the timber is charged higher, but I believe it is the better administration, and that they get more out of the forests.

2068. Are you quite sure of that; do you know from the reports that there has been no rise in the rate charged by Government for cutting the timber?—I know in Madras there was recently a rise in the charge for fuel. It was very low before, and the Government have always been told that there was no reason why the department should not charge the market price, and that, even to the other departments of Government, it should not give away its revenue.

2069. Do you know whether that revenue includes anything that was cut for the use of the Government; was it charged first to that side of the account?—Yes; lately they have been making some State railways, and it has been observed that the Forest Department lost by the transaction; and the Secretary of State has told the Government of India that it ought to be sure to get its profit out of these transactions, just as if it were an individual.

2070. You mean that on the one side of the account the full value of timber should be entered as if it were sold to private persons?—Yes; that Government should receive the full value.

2071. And then charged as the expense of the construction of the railway on the other side of the account?—Yes.

2072. Do you think that that order has had any effect in increasing the revenue?—It is only in the last year that it has gone out. I have no doubt it will be attended to.

2073. But has the expense of the administration of the forests kept pace with the increase of receipts?—It has, and naturally, because finding the forests in very bad order, of course expensive establishments are required to bring them back to order.

2074. Can you state the expense of administration in the first year you mentioned, and in the last?—Not for the first. For 1864-65 the expense was 186,000 £, and the surplus was 163,000 £. The Budget estimate for this year is 573,000 £ for receipts; the charges are estimated at 461,000 £, and the net is 121,000 £.

2075. Then the effect of the administration appears to have been to reduce the net revenue; even though you had brought to account the supposed profit of the Government railways, you have reduced the net revenue by a considerable amount?—Yes, it will be reduced until you have the effect of these measures of conservancy. You certainly have increased the receipts very much.

2076. But you have increased the expenditure so much, that you have diminished the revenue?—But that was because you must necessarily do so; in future years you will get the benefit of these new establishments, and you will then get a larger net revenue.

2077. But is that a speculative opinion of your own, or have you any authentic information in the way of a commercial estimate of the out turn of the undertaking, which shows that that is the case?—We have not that; but the Governor General has expressed a very strong opinion on the subject.

2078. The Governor General knows no more about it than you do, because he does not administer the forests; have you any practical estimates, founded on what may be called a commercial investigation of them?—The Inspector General is acquainted with all the forests, and with what they are likely to produce; and it is shown by the reports sent home, that he very carefully considers the probability of a return being made to the Government ultimately.

2079. But I want to know whether you have got any information that is apart from the general expression of probabilities, based on what we may call an estimate; for instance, of the number of timber trees per acre, or per square mile, and so forth, showing what would be cut down within a definite term of years, and at what value?—We have got nothing based upon the actual area and the number of trees, except in particular forests. Whenever any increase of establishment is recommended, it is always stated what are the grounds on which it is expected that there will be an increase of revenue, which will make this increase of establishment answer to the Government. It would be refused or modified where there was no probability or expectation of such an increase.

2080. Do you expect that the cost of the establishment will be diminished in future years, or will it continue to increase?—There is no doubt that when you can get your training school in India, and can employ the natives more, administration will not be so expensive; but now there is the sending out of skilled people from England, and the employment of skilled people in India, which of course make it expensive at first.

2081. Have you any statement of the number of Europeans that have been sent out or have been employed in India as compared with the number of natives?—I think the European establishment all over India is 88 or 90.

2082. Are they all permanently employed?—They are all permanently employed; they are all either conservators, deputy conservators, or assistant conservators.

2083. Are they employed for the whole of their career with promises of promotion, under some scheme of promotion?—Yes, under a regular scheme of promotion which has been sanctioned in this country.

2084. And under a retiring allowance?—Yes, but many of these are officers of Government who have taken to this line.

2085. Who belong to the General Civil Administration of the country?—Yes, both covenanted and uncovenanted.

2086. Can you state the number of natives that have been employed under them?—No, I cannot. One native has been nominated to one of these training appointments.

2087. Has any distinction been made in his salary from the salaries of the others?—No, because he was sent out from England.

2088. You have mentioned that by employing natives instead of Europeans the expense would be less; I want you to explain how the expense is less, if when a native is employed instead of a European, he is paid the same salary?—I was alluding to the time when you would have your training school in India. Then you would fix a different scale of salaries: you would not give a man the same salary who was in his native country as you would if you took him from a distant country and sent him out to India.

2089. That

2089. That opens a large question; but are you aware, that Government have taken that view of the payment of the salaries of natives, or have they not acted on the view that you condemn rather of paying the natives exactly the same salaries as the Europeans, when they hold the same appointment under the same conditions? Are you aware of any rule laid down by the Government of India or the Government at home, that where a native holds an appointment and performs duties under the same conditions as a European, he should receive less salary?—I am not aware of any such rule, nor do I know that any exists; but it only strikes me as a natural consequence.

2090. What I want you to distinguish is between your own speculations of what might be right and what is now going on in India as a matter of fact?—There is no training going on in India, and none can go on just yet.

2091. You have told us that the only native who has been sent to take an office in the Forest Department under the same conditions as a European has received precisely the same salary as a European employed in his place would have received; in that view of the case, would the employment of natives in any way reduce the expenditure?—Not of course in that view.

2092. Is not that the only view which is presented to us by the proceedings of the Government of India?—At this moment, certainly, it is.

2093. However, it is your opinion that if natives were employed on a lower scale you might reduce the expenses?—Yes.

2094. When do you expect to see any sufficient number of natives qualified to perform these duties?—There can be no training school in India until we have got the forests in such a state as to present an example of what a forest should be, and until there is a sufficient number of skilled people in India who can instruct others.

2095. Have you got a school of instruction out there?—No; and none is to be established until there is a sufficient number of skilled people to instruct, and forests in such order that they they would present an example of what forests ought to be. That I know was Mr. Brandis's view of the matter.

2096. You have no approximate estimate at all on which an opinion can be formed as to the future production of the forests?—No, I do not think any could be got. The conservator of Canara this year has said that the forests will produce a very much larger sum than they do now.

2097. Is that general assertion supported by any approximate estimate of the produce of the forests worked out in figures?—Not worked out so as to be accepted as a regular estimate.

2098. Will it be necessary to legislate for the purpose of getting a proper administration of the forests as a source of revenue?—There is a Bill now before the Legislative Council. I have seen a notice with regard to it, saying that the Government believed that it would fully meet all the requirements. It has been prepared with great care by Mr. Brandis and Mr. Baden Powell, who is now acting as conservator in the Punjab.

2099. After that is passed, there will be no legal difficulty in the way of preserving the forests?—No legal difficulty.

2100. Do you consider that the forests are now being administered for the purpose of pro-

ducing revenue, or for the purpose of supplying the requirements of the country in timber?—The Government have been instructed not to consider revenue as the main object, because the forests must be preserved even if it costs money, on account of climate, and on account of the production of timber and firewood.

2101. You look upon it that the main object is to have the production of better woods or more suitable woods in larger quantity available?—Yes.

2102. I think you say that the survey of the forests for actual demarcation has not been undertaken yet?—It has been undertaken in parts; part of Bengal has been done, for instance. In several administrations it has been begun.

2103. Do you know how far the general survey of India has penetrated into the forests, or does it only take the outer edge of them?—Only the outer edge, I presume.

2104. So that the whole inner plotting of the forests has to be yet made?—Yes.

2105. Mr. Cave.] I do not quite understand how you expect an increase of revenue from the better management of the forests; do you expect an increase of revenue from having a larger market for wood?—Yes, certainly an increased demand for wood. One of the circumstances which have induced the Government to look after the forests is the increased price of fuel and timber all over India, or almost all over India. The introduction of railroads, of locomotives, and of steamboats, has made a demand for fuel and also for timber for constructing the railways. The increase of population and the general increase of the wants of the inhabitants, has also led to an increased demand.

2106. How would an improved administration of the forests give you an improved revenue?—By enabling you to manage your forests more economically, and to bring more timber to market in better condition, and to have a supply always ready in rotation, and so on.

2107. And to improve the means of communication, I suppose, by making roads?—Yes, those are always charged against forest revenue; the forest roads are of course an expense which is not always recurring.

2108. And that is what you mean by the improved administration of the forests?—Yes.

2109. Do you also mean planting?—Yes; I include planting. There is a doubt in India whether natural reproduction or planting is the best method; but natural reproduction, if you can manage it, would be more economical; and there is no doubt that both ought to go on together.

2110. In how many years would the trees become valuable that are planted under this new system?—I believe that teak trees are 80 years in growing.

2111. Until you first bring into the market the trees which are now planted, you would expect an increase of expenditure not commensurate with the increased revenue, I suppose?—Not necessarily. I should think that every year there would be an improvement.

2112. But with regard to that part of the operation of the administrators of the forests which consists of planting, that would be a dead loss for 80 years, would it not?—No; you get the loppings, which more than pay the expenses. There is an example of that in the Malabar plantations. Mr. Conolly, the collector, made

Mr. C. B. Phillimore.

25 April 1871.

Mr. C. B.
Phillimore.

25 April
1871.

some very fine plantations, and they more than pay their expenses from the loppings.

2113. Those loppings must be from the old trees that are being cut down now, are they not?—No, from the trees of the plantation. I think that these plantations were begun in 1842.

2114. Then, in fact, the trees that are planted begin to bring in some profit long before the 80 years that you mentioned?—Certainly.

2115. How soon would a plantation begin to pay its own expenses?—That I should not like to say.

2116. Still, long before the time that the trees had to be cut down, it would begin to bring something towards the revenue?—I should say long before; but that is a question which Dr. Clegghorn could give you practical information upon.

2117. Mr. *Fawcett*.] I understand that you superintend the forest departments at the India Office?—Yes.

2118. And I suppose there is quite enough to occupy your time in that duty now?—There is plenty of work in it; but I am also in the Revenue Department.

2119. There is really a distinct Forest Department in the India Office, is there not?—It is joined to the Revenue Department.

2120. How many officials should you say were employed at the India Office in this Forest Department?—There has been no addition made on account of the forests specially, except that when there are forest examinations there is a temporary clerk employed specially.

2121. Is there a very considerable amount of work to be done in the India Office connected with the Forest Department?—I find that there is.

2122. In the revenue accounts, or in any other accounts, is any estimate given of the expense of the home charges incurred for the Forest Department?—They are not separately put.

2123. So that we have no means of ascertaining what the home charges are for administering the Forest Department?—The home charges are nothing but the secretary, and the assistant secretary, and three clerks, who are partly revenue and partly forest officials. It is a mixed department, which has rather grown of late years; the last five or six years, I may say.

2124. You have not been to India yourself?—No.

2125. Can you furnish me with the leading items which compose the revenue of 570,000 £, and from which the forest revenue is derived?—I cannot give the items.

2126. May I venture to ask what the Revenue Department of the India House does with regard to the forests?—It reviews the Budgets that come from India on the subject, and it does go through the accounts.

2127. But how can you review the Budget if you do not know the items?—A matter of pure detail would not be sent. The annual reports furnish us with information. But some reports, I think, only give the receipts of revenue for the different districts.

2128. Has the Revenue Department of the India Office, with which you are connected, ever ventured to suggest to the authorities in India that you cannot review a Budget without knowing the items?—There is an annual report sent every year from Bengal, Madras, Bombay, and the other administrations, and the information you want can be got from these.

2129. I venture to think it strange, consider-

ing that a considerable charge, whatever it may be, is thrown upon the revenue of India for these expenses of the India Office in superintending the Forest Department, that apparently no account whatever is kept of the items of revenue. You cannot furnish me with a statement how much is produced by the sale of wood, how much from the loppings, and how much from any other sources of revenue?—I could tell you, certainly, from the annual reports of each district. They are not put together in any one shape in the Forest Budget, for which the general receipts and charges only are wanted.

2130. But has it not ever struck the authorities of the Revenue Department that there is an extraordinary growth in expenses, that with a greatly increased revenue, you have expenses increasing so fast that the net has diminished instead of increasing?—We know that it has been increased by the necessity of increasing the establishments for the purpose. No establishment is increased, at least except a very small sum is involved, without actual sanction from home.

2131. I would venture to ask you what you define the function of the Revenue Department at the India Office to be, except to keep some check and control upon the expenditure; cannot you form some estimate, you having been in that department for some years, of the items of this revenue?—I know the sources from which they are derived, from the sale of timber, fuel, and forest produce of other kinds; honey and lac, and the like.

2132. But you cannot give me any idea whether half the revenue is derived from timber and one-third from fuel, or whether one-third is derived from timber and half from fuel?—I could find out that, I think, certainly; but of course that is a matter of detail that we should not interfere with here. As long as it is shown that there are certain profits derived, that certain wood must be got, and that the forests will produce it, the proposal would be sanctioned.

2133. Perhaps you would, by an example, give me an illustration of any case of interference. I want to know what you do at the India Office, if you do not superintend these items?—We do superintend; there is not a single paper which is not read very accurately and carefully.

2134. But would you give me any example of your objecting or interfering in regard to any items of expenditure?—I cannot at this moment call cases to mind, but remarks and objections are constantly made on other subjects, and would be, if necessary, on this.

2135. You could not furnish us with an example?—Not at this moment.

2136. Are you quite sure that no portion of this revenue has arisen from the sale of certain proprietary rights of the Government in the forests?—None; I may say that.

2137. That the Government has not sold the right of raising revenue from the forests?—No; on the contrary, they have been desired particularly to keep all the forests as much as they can in their own hands; they rent private forests, if they can get hold of them.

2138. You have read the reports and financial statements that are usually made in India; and this 570,000 £ that the forests yield is put down as an item of revenue?—I have not read the general financial statements, but that is the sum named in the Forest Budget for the year 1871-72.

2139. Is

2139. Is there at the same time in the Budget an item put down for expenditure?—No doubt that would be ascertained in the financial department; I have nothing to do with the account.

2140. Is it not an element, in looking after the revenue, to see at what expense that revenue is obtained?—No doubt, or I should not have been able to give the items that I have given to-day.

2141. But you do not know whether it is put down in the financial statement of each year?—I can say it is. I have got here a paper which states what they mean to put into the Forest Budget. I gave you the Budget charges at the same time that I gave you the Budget receipts.

2142. It is stated in the financial statement, and not mixed up with other items of expenditure?—It is mixed with the land revenue in the accounts, "land revenue, forests, and abkars (includes allowances to district and village officers in 1870-71)."

2143. Are you quite certain that in the financial statement which is annually made in Calcutta, from which the public obtain their information as to the financial position of India, it is distinctly brought out that the Government gets 570,000 *l.* from the revenue from the forests, and that the expense of getting that revenue is 450,000 *l.*?—I have no doubt that it is.

2144. But you cannot be certain whether it is stated as a distinct item?—I have not the smallest doubt it is, but I cannot state for certain, because I have not read the Budget speech.

2145. Sir T. Bazley.] Has the sale of timber for fuel been confined to the inferior quality of timber?—I do not know. Of course the good timber is not sold for fuel; the teak is not sold for fuel, except the loppings, or except, perhaps, accidentally.

2146. What market is teak sold in?—I do not know which market; the people come for it to the forest depôts, and a great deal of it is conveyed to Bombay, Calcutta, and Madras.

2147. If only people in the neighbourhood of the forests send for the timber; it is a limited market?—Yes, but there is a great demand; from Burmah there is a considerable export.

2148. Mr. Lyttelton.] Is there a large foreign trade in timber?—I do not know the extent of it, but I think the foreign trade in timber is chiefly from Burmah, Moulmein, or Rangoon.

2149. Chairman.] That is chiefly exported, to import it into other parts of India, is it not?—Yes; but I believe a good deal of teak has been exported of late years to Europe.

2150. Mr. Lyttelton.] Is there any export duty on timber in India?—No, not in any part of India.

2151. I thought there was in Burmah?—There is a transit duty on the timber that comes from foreign states, which is the way we levy the royalty on that which comes down from the upper states.

2152. Mr. Candlish.] The surplus from these forests in 1864, I think you stated, was about 250,000 *l.*?—In 1864 it was 163,000 *l.*; the receipts were 350,000 *l.*, the expenditure 186,000 *l.*, and the net 163,000 *l.*

2153. What was the last year which you gave?—The last is the Budget estimate; receipts 573,000 *l.*, expenditure 451,000 *l.*, and net 121,000 *l.*

2154. That would be a surplus of about 120,000 *l.*?—£. 121,000.

2155. So that the greater the income the less surplus.

the surplus?—That is exactly what I hope people will not think.

2156. That is exactly what the figures disclose, is it not?—Not altogether. In the estimate for the year you do not get the value of the stock in hand which is always considerable, because at the date when the Budget accounts are made out, there is always a considerable number of outstanding liabilities, and there is stock in hand, which is carried to the account for the next year.

2157. [Chairman.] But that would be the same for each year, would it not?—Yes; but the last one you have the benefit of.

2158. Unless those figures be very much in excess of what they were in former years, that would not affect the comparison?—No.

2159. Mr. Candlish.] Then the increase of revenue is about two-fifths between 1864 and the present estimate?—Yes.

2160. Whilst the increase of management has been two-and-a-half times, because 186,000 *l.* multiplied by two-and-a-half, is about the present cost of management?—Yes.

2161. What is the improvement in administration which you have got for this increase of 260,000 *l.*?—We have not got it yet; we are to reap it; we hope to reap it.

2162. I am asking you definitely what is the improved administration which you have got?—You have got a regular organisation; you are not now dependent upon one single individual, and his taste in cultivating the forests; he might do it extremely well, and many of the collectors did it well, for a certain time, and then some other collector came, and his taste not being in that direction, the forests were neglected.

2163. Then for this two-and-a-half increase of cost we have improved taste, and uniformity of administration?—I meant that a man's own inclinations might lead him to look after the forests, and another man to neglect them.

2164. And for the sake of uniformity of management we have paid two-and-a-half times the previous cost?—If you like to put it in that way. What I mean is that you cannot, unless you have a separate department, have a regular organisation of the forests, because it only depends upon the inclination of one man, and there is no system.

2165. But the main object is revenue?—The main object is not revenue in this case.

2166. Do you know any parallel case in India or England, or any part of the world, anything that has come under notice where the cost of managing an estate is four-fifths of the revenue?—I have not inquired into that.

2167. You expect a diminished cost of management when you have superseded Europeans and employed natives?—Not wholly on that ground, but I expect that as the forests get into better order they will require less management, and therefore the expenses will be diminished; and I also stated that I thought native management would be cheaper than European, and that you might get to that in time, when the natives were sufficiently trained.

2168. Let me put this general question to you; would not the pay of natives at a less rate than the pay to Europeans tend to engender very much discontent amongst the natives of India?—I should think not, but that is a point to be decided by those who have been in India, and know that Europeans are differently paid, as to some extent is the case now.

Mr. C. B. Phillimore.

25 April 1871.

Mr. C. B.
Phillimore.

25 April
1871.

2169. You think that political evils would not result from the saving of money in that way?—I cannot say.

2170. What is the object and utility of this money management which is in your hands?—The objects of the superintendence of the forests is the object of any general branch of Government, which is reported to the Secretary of State. He must have somebody to look through the papers.

2171. But we are paying 450,000 l. out in India for the management, and the India Office bears no responsibility?—I do not understand the bearing of your question; do you mean that there should be no reports made from India on the subject of the forests?

2172. What is the object of the present Home management?—To control the Government of India, and see that the work is properly done.

2173. To control men in managing their own affairs?—Not that.

2174. The Home Government are not liable for any money results, are they?—The final responsibility rests with the Secretary of State in Council.

2175. *Chairman.*] You assist the Secretary of State in Council in the exercise of his powers of supervision over the Budget?—Yes, that is the Forest Budget.

2176. Mr. *Cundlish.*] What is the whole expense of superintending this forest account; have you any assistants?—I am the assistant of the secretary in the Revenue Department.

2177. Have you clerks?—Yes.

2178. What is the expense of superintending this forest account in England?—I really do not know what their salaries are; but, as I was explaining to another Honourable Member, the Forest Department is merely an adjunct of the Revenue Department. I happen to have taken interest in it, and to have had the management of it.

2179. You cannot point out to the Committee what are the advantages accruing to India itself from this superintendence of the Forest Department in England?—I think great benefit has accrued to it; by that means we are enabled to get a system for training men who will be of great assistance for preserving the forests.

2180. The English superintendence has been the means of creating a service of men for managing the forests in India?—Training them.

2181. You do not train the men here at all; they are trained in India, are they not?—We take the steps for getting the men; we supply the men; we find the men, and make the arrangements for having them trained in France and Germany.

2182. Then the use of this home superintendence is to supply servants to India?—That is one use of it.

2183. Mr. *Grant Duff.*] Your position is that of an assistant in the Revenue Department?—Yes.

2184. The Revenue Department of the India Office is the department which deals with all the despatches that come from India, relating to the land revenue, salt, opium, customs, and excise?—Yes.

2185. Mr. *Prideaux*, who is the head of that department, and is at present ill, and cannot come before us, has for some years handed over to you the dealing with those despatches which

come from India, specially relating to the Forest Department?—Yes.

2186. And you have gradually, from taking an interest in the subject, got into your hands whatever business there is at the India Office that especially relates to forests?—Yes.

2187. But there is no such thing as a forest department or even sub-department properly so called?—No, it is an adjunct; it grew out of the Revenue Department, and for this reason that the sayer duties were also under the Revenue Department, and so the forest duties got mixed with them.

2188. The proper answer to a question that was put to you a little while ago, as to the amount of expense at the India Office that was caused by the supervision of the forests in India, would have been a fraction of your salary?—Yes, that is what I intended to convey.

2189. A fraction of your salary is the whole expense of the India Office establishment relating to the supervision of the forests?—Yes, that is what I intended to convey.

2190. I suppose that you have made all the arrangements that have become necessary, on account of the establishment in India of a scientific forest service, on the same plan as those which exist in all those countries of Europe where there are great forests?—Yes; but I do not mean to take the credit of having done all that.

2191. You have had the general superintendence of it?—Yes.

2192. It has been, for instance, your duty to make arrangements about the examination of the young men?—Yes.

2193. And, further, when the young men have come into service by competitive examination, it has been part of your duty to correspond with the directors of the great forest schools at Hanover and Nancy, where they have generally been trained, and to make all the necessary arrangements for these young men there?—Yes.

2194. Has it further been your duty since the training at Nancy was interrupted by the late events on the continent, to make a great many arrangements in this country, so as to prevent the supply of young men for the forests of India being cut off and stopped for a time?—Yes.

2195. And you have had a great deal of correspondence connected with all these matters?—Yes.

2196. Nevertheless, you do not want to convey to the Committee an impression that the work of the Forest Department is all the work that you do at the India Office?—By no means.

2197. Of course the amount of superintendence in any proper sense that can be carried on in this country with regard to such things as forests by the Secretary of State in Council is very small indeed?—Of course it is; it is only with respect to general principles.

2198. But it is the principle of our Government, is it not, that all matters of great importance should be reported to the Secretary of State in Council?—Yes.

2199. So that he should be kept generally informed of all that is going on?—Yes.

2200. Therefore that being so, it must be the duty of the Government of India to report generally, of course not in great detail, as to what it is doing with regard to its forests, and it, of course,

course, must be the duty of you or of some other person to attend to all those despatches that relate to forest matters?—Yes, to read those papers and the enclosures on which they are founded.

2201. Without yourself or some one in your place, would it have been possible for the Indian Government to have got together a trained staff of forest officers in Europe to supply its wants in India?—I should say not, they must have had somebody to do it.

2202. This whole system of scientific forest management in India is quite in its infancy?—Quite in its infancy; the first set of trained men only went out at the end of the year 1869.

2203. But in all countries in which there has been for a long series of years a scientific forest management, it has been found, has it not, that that scientific forest management eventually produces very considerable direct advantage to the State as well as indirect advantages of many kinds?—Yes, I should say so.

2204. And there is every reason to suppose that the same results of direct advantage, as well as the results of indirect advantage will be produced in India?—Certainly.

2205. Mr. *Fawcett*.] I understood from an answer which you just now gave to Mr. Grant Duff, that the expense of managing the Forest Department in the India Office was represented by a portion of your salary; would it not be more correct to say by a portion of your salary and the salaries of the other assistants and clerks who are employed?—Of course there are clerks who copy letters if they are wanted, and you might take a fraction of their salaries too.

2206. Mr. *Grant Duff*.] But that would be something perfectly insignificant?—Very small.

2207. Mr. *Fawcett*.] I understand from what you have just stated, that Mr. Pridaux, the head of the Revenue Department, has handed over his Forest Department as a department of the revenue to you?—Yes, he left it to me.

2208. Therefore you are primarily responsible for it?—Yes.

2209. You knew probably that this was a Finance Committee?—Yes.

2210. And that we should like to obtain information from you particularly on finance?—Not on the details of finance.

2211. But on the principles of finance?—And only as regarded particularly the forests.

2212. Can you furnish me now with a statement of the revenue and the expenditure of each particular forest to which you have alluded; for instance, can you tell me what is the revenue that the forests of Bengal or any other presidency yield, and what will be the expense of management?—I will take Madras; the figures sanctioned for 1871-72, are these—receipts, 49,500*l.*; charges, conservancy and working, 21,450*l.*; establishment, 17,250*l.*; surplus, 10,800*l.*

2213. That you know with regard to each forest?—Yes.

2214. But there are no accounts sent to your office which enable you to say how the items of revenue are made up although yours is a revenue department?—I could make them out from the annual reports.

2215. Have you ever made them out and presented them before your chief?—I have stated the matter generally; I have not presented them in any detail; at least, I do not always so present them.

2216. Is there any paper or record which you

could produce, in which, before any authorities of the India Office, you have laid the items of this important branch of revenue?—Not the items, unless for special reasons.

2217. And although yours is a department for supervising the revenue, you do not think it necessary to go into details?—I do not say that, but it is a different thing to lay all the details before my chief.

2218. But I am unable to ascertain whether you have been into detail?—I always go into details.

2219. You have been engaged in this department for many years?—For some years.

2220. Then you can give me some general idea of what items this revenue is composed?—I cannot tell you the proportion that one bears to another.

2221. You can give me no rough estimate even of what portion of this revenue is produced by the sale of timber and what by the sale of fuel?—No.

2222. *Chairman*.] Would it not be possible for you to make out a tabular statement from the reports, showing how the revenue is derived from all sources, and showing how many trees have been cut down in each forest, and so on?—I will see; I have no doubt it can be made out from the annual reports for any one year.

2223. Mr. *Fawcett*.] You do not actually know whether it can or cannot be made out, you have examined these accounts so carefully?—I have not examined the accounts carefully, because I go into them with great minuteness and accuracy, but I do not carry those things in my head. There are 12 of these separate administration reports.

2224. Not only cannot you tell me what the items of revenue are, but you cannot tell me whether it is possible to find them out from the annual reports; you simply say you think it is?—I look upon the items from which the revenue is drawn as a matter of detail for each year; I think it is a pure matter of detail. I should think it wrong to suggest to the Secretary of State, unless there was something evidently wrong, or any great discrepancy, that he should interfere with the Governor General, or the Governor of Bengal, or of Madras, on a point of mere detail.

2225. But how can you find out whether there is anything sufficiently wrong for you to suggest it unless you go into these details?—But I do go into them.

2226. I ask you whether you can certainly furnish me with these items; if you had ever gone into them, you could, I presume, tell me distinctly whether you could furnish them or not?—I have no doubt that I should be able to furnish them, but I do not wish to commit myself on that point, because I do not wish to have it said afterwards, "This is not what I wanted."

2227. Perhaps you will kindly come and hand them in another day?—Yes.

2228. *Chairman*.] Will you prepare a tabular statement showing the sort of timber that has been derived from each forest, distinguishing that which has been cut down and sold by the Government as timber from that which has been cut down by individuals under licenses, and showing how much has been realised by the timber and how much by the licenses?—Yes, that can be easily given for some provinces; Burmah for instance.—(*Vide Appendix*.)

Mr. C. B.
Phillimore.
—
25 April
1871.

Mr. C. B. Phillimore. 2229. *Sir J. Elphinstone.*] I think I understood you to say that the Forest Department was of recent establishment?—It is, in its organised form.

25 April 1871. 2230. How long is it since it was established?—It was established in 1862.

2231. When you took over these forests, they had been very much ravaged, and were in an exceedingly bad state, were they not?—Very much so.

2232. I think I understood you to say that there were in Central India 21,000 square miles, in Burmah 2,000 square miles, and in Assam 4,000 square miles, making altogether 27,000 square miles of forests?—Yes; but I mentioned at the same time that that would give only an inadequate idea of the extent.

2233. If I recollect rightly, I think that is about the area of the surface of Ireland?—Perhaps so.

2234. Finding those forests in this damaged

condition, it is a fact that at this time you have a surplus revenue on the right side?—Yes.

2235. And you anticipate that you will not have a deficit, but that the surplus will in all probability be increased?—Yes, certainly.

2236. *Mr. M. Chure.*] Is there any system of inspection and report to the Government of the state of the forest, independently of those who have regular charge of it?—No; the conservator is the person who makes the report to the Government.

2237. And there is no intervention of any other party?—There is the Inspector General of Forests, who advises the Government upon all points, and superintends himself those forests that are under the Chief Commissioners, for instance in Burmah, Central India and Oude; but he does not interfere, or only very little, with the Lieutenant Governors, and not at all with the Governors of Madras and Bombay.

2238. It is the local government that has the charge of the forests?—Yes.

Mr. HUGH CLEGHORN, M.D., called in; and Examined.

Mr. H. Cleghorn, M.D. 2239. *Chairman.*] WHAT is your employment in connection with the forests of India?—I went to Madras in 1842 in the medical department; in 1852 I was appointed professor of botany in the Medical College; in 1855 I was requested by Lord Harris to draw up a scheme for organising a forest department for that presidency; in 1861, I was directed by Lord Canning to proceed to the Punjab to introduce the same system, and to examine and report upon the timber resources of the Western Himalayas, that they might be rendered available for railway wants and State purposes; and two years afterwards I was associated by Lord Elgin with Mr. Brandis, in drawing up a scheme of forest conservancy for all India.

2240. Will you be good enough to give us, without all the details, a short explanation of that scheme?—In 1855, when I undertook to draw up a scheme there was no system previously existing in the Presidency of Madras. The forests were in a very damaged state. Railways then beginning were at a standstill for want of sleepers, the Wellington Barracks for want of beams, and the Ordnance Department for want of gun carriages. There were great difficulties in obtaining timber. A few probationary assistants were appointed, and year by year several collectorates were examined and reported upon, until the whole presidency was gradually overtaken, and the department was formed.

2241. What was the principle of the arrangement of the department?—I was the first conservator, with three assistants, three second-class assistants, and a few native subordinates.

2242. And what forests had you to conserve?—My business was to go from collectorate to collectorate, to ascertain what forests belonged to Government, and what forests were worth conserving, and to propose to the local government how to treat them.

2243. Do you not use the word "forests" as including all the growing trees that were claimed by the Government?—I use the word "forests" as representing a large area containing very little good timber, and yielding very little revenue at that time.

2244. What was the cause of that?—The almost utter exhaustion in accessible places.

2245. The forests were exhausted?—They were exhausted; timber had been previously obtained by very loose permits, and they were altogether in a very unsatisfactory condition.

2246. Did you take any trouble to ascertain the area and extent of the forests, and the general quality of the wood to be supplied from them?—In the original surveys, forests are included under the general term "wastes." There were no forests demarcated until the last few years; the forest demarcation is now going on, and in a few years I trust it will be completed. The forests of Madras are principally on the western coast, as shown on the map which is behind you, and which was prepared to illustrate a paper read at the British Association of Science (1868). The surveys are not fully entered; the colours indicate the distribution of the principal trees in the better or first-class forests. I propose to fill in the more recent surveys, and to prepare another paper for the ensuing meeting at Edinburgh.

2247. What was the productive character of these forests?—There was very little revenue derived from them at that time.

2248. But what stage of growth were they in; were they capable of producing a considerable income?—The forests required to be demarcated and put under regulation, by excluding cattle, preventing fires, and taking other necessary steps.

2249. But was the timber in them in various stages of growth, so that with care they would yield a good revenue?—By being shut up for a number of years, and a system of careful management introduced. The system is still in its infancy, but the forests are now in a very different condition.

2250. But was there no forest that was being worked at that time and yielding revenue?—They were worked by unscrupulous contractors or persons who received permits, but there was no check, as to the number of trees cut, upon the permits.

2251. But was there much timber available to be cut down at that time?—The supply of timber at that time was very inadequate and very uncertain. As I have mentioned, the public departments

ments were in great want, and that was one reason why the Forest Department was formed.

2252. What was the system upon which the trees were to be cut down and the forests administered that you organised?—The system was that a certain number of trees should always be left per acre: that every tree should be marked by the department in the first-class forests, and that there should be annual working plans and Budget estimates.

2253. Were the forests to be cut down by the Government or by other persons by license?—They were entirely cut down at that time by persons holding licenses.

2254. What was the payment made; on what principle?—A small rate of seignorage per tree; it varied according to the kind of tree; it might be one shilling, or it might be three shillings, or four shillings.

2255. That would be according to the size of the tree and the character of the wood?—Yes.

2256. When did the Government begin to cut down timber for the purpose of selling it?—As the forest organisation improved, and as reserves were formed, the departmental system was gradually introduced, and the license system gave way to it.

2257. And the principle of the administration was that Government itself should cut down the trees?—As far as possible under their supervision.

2258. And that no one else should be allowed to do so?—Not in the first-class forests; it was all to be done by Government and their employés.

2259. How long is it since you saw the forests?—I came home three years ago. I have personal knowledge of most of the forests in the Madras Presidency, and a great extent of the Punjab and North-west; I have also seen those in Burmah and other parts of India. Madras was under my charge for 11 years.

2260. What has been the effect in Madras of this system of administration of the forests, as far as you have seen?—The Government at various times have admitted that the forests are in an improved condition, and there has been an increasing revenue. There has been a great diminution of wastage; that is to say, timber trees were formerly cut at 4 feet from the ground, whereas now they are always cut at the lowest possible point. No fires are permitted in the forests; formerly a great deal of wood was burnt. The railway and other public departments receive their supply on half-yearly indents, which was not the case before; there were great delays and great uncertainty as to the quality of the wood from want of seasoning.

2261. Are the forests now in such varying stages of growth that they promise a regular supply of timber?—The promise is improving annually. They are systematically inspected, both by the forest officers and by the revenue officers, and it is now a department which, although in its infancy, is year by year improving.

2262. Can you explain what the profit of cutting down the trees and selling them is, compared with granting licenses?—The profit apparently is greater from granting licenses, because you have less outlay; but the waste under that system was excessive; it led to the destruction of the forests.

2263. In what way do you mean there was waste?—There was no check on the license holder

in the old time as to the number of trees he took out of the forests, and he was not tied down to cut the tree level with the ground; he cut it from three to four feet high, so that the best part of the tree was lost. And frequent forest fires did great damage; all that is now forbidden.

2264. Apart from these advantages, is it your opinion that there is less net revenue derived from the trees cut down and sold, than from the quantity of licenses?—I admit that there may be less net revenue by departmental management, for a time at all events.

2265. But is it your opinion that there is, however, a growing improvement in the forests, which is an equivalent to that loss of revenue?—I consider that there is a very great advantage from departmental management in preference to the licenses.

2266. Have any means been taken to estimate the out-turn of any of the forests under the new system, as compared with the old?—I think the progress reports year by year of the 12 administrations, and a revenue increasing yearly are sufficient evidence as to that.

2267. But has any estimate been made of the probable out-turn of any of the forests?—I do not know that I could answer that question; I can speak more as to plantations, and the cost of plantations. Reference was made to the Conolly plantations, which, in the twelfth year, began to pay back, and every year since have paid an excess of revenue. They were begun in 1842; there was an outlay for the first 12 years, but there has been an increase in revenue every year since.

2268. But you are not aware that anything like an estimate has been made of the quantities and values?—Of that particular plantation and of others we have such estimates, but of the exhausted forests it would be very difficult to give an estimate.

2269. Has any estimate been made, or any attempt at an estimate, of the reserved forests?—I could not easily answer that question.

2270. Is there any great quantity of timber now cut and stored in the forests for further sale?—There is a much greater stock of timber taking all the depôts, than at any previous period.

2271. Ready for sale?—Seasoned and ready for sale.

2272. Have any steps been taken to make roads to open the forests?—There is a liberal allowance in every Budget for the improvement of communications, for roads, for the blasting of rocks in the streams, and also for forming plantations; something like 20 per cent.

2273. Do you know whether that is included as part of the expenses of the forests, or whether it goes to the expenses of public works?—It is purely forests. When within the forest limit, it is entirely forest expenditure.

2274. You are not in a position to give us an estimate in figures of the probable increase in production of the forests in Madras, or those that have been under your care?—I can only refer to the Budget figures for the last eight years, showing that there has been a steady rise in the receipts. Although there has been also a steady rise in expenditure, I believe that that was needful on account of the previous exhaustion, and will not be so great in proportion prospectively.

2275. What has been the effect of the legislation for the preservation of the forests?—There

Mr.
H. Claghorn,
M.D.

25 April
1871.

Mr.
H. Cleghorn,
M.D.
25 April
1871.

was an Act in 1865 which was accepted by seven of the minor administrations, that is to say, rules were formed under it in seven of the provinces and administrations. That Act imposed penalties on mischief and trespass, sanctioned confiscation of stolen timber and implements, and also enacted that the value of drift timber should be credited to Government. It was a very simple Act; the penalties were not severe.

2276. Are the forests to any extent replanted, so as to perpetuate the growth?—Every year there is a liberal allowance for replanting, and the formation of fuel plantations for railways has become an important duty of forest officers, imposed upon them by the necessities of the case, but causing great present outlay.

2277. You hope to be recouped that, when you cut down the trees to sell them?—Yes.

2278. How long do they take growing?—For fuel of railways and steamboats, seven or eight years; but for timber purposes, 70 or 80.

2279. That would depend upon the character of the timber?—Yes.

2280. Have you had anything to do with the forests in the Native States?—I have on three or four occasions drawn up leases by order of Government with native chiefs. The Rajah of Travancore has a conservator of his own, so has the Rajah of Cochin. They have seen the advantages and have adopted our system. The smaller hill chiefs write frequently for advice, and some of our rules have been introduced in a more or less modified form.

2281. Has anything been done to facilitate the cutting down or dealing with the timber; have you established any machinery for the purpose?—We have been desirous to supersede the use of the axe as much as possible by the introduction of the cross-cut saw, and other appliances. We have introduced timber carts, and in that way we have been able to carry out many pieces of timber which otherwise would have been lost. We are desirous to see saw machinery introduced more largely, for the saving of time and labour.

2282. Has it been used at all for converting the timber?—We have the cross-cut saw introduced in many of our forests; but saw machinery is not so easily introduced. We have it in one or two places. There are saw companies in Burmah, Bombay, and Assam. We encourage them and send wood to them. There are also saw-mills in the Punjab at Madhapore.

2283. Are those private?—For the most part private. Madhapore is a Government one, and there may be one or two others.

2284. Do the Government undertake the conversion of the wood also in saw-mills?—In general they prefer transferring it to the companies.

2285. And all the expenses of managing this machinery appears in the accounts of the expenses of the forests?—In the case of the Madhapore saw-mill it is connected with the Baree Doab Canal. I do not think that any saw-mill appears in the Forest Estimate.

2286. Has the administration of the forests tended to decrease the wild animals to any extent?—Elephants are becoming very scarce in Southern India. They have been extremely valuable to the forest department. Every year they are fewer, and consequently we are the more anxious for saw machinery.

2287. You do not mean that you wish to see the wild elephants only?—No, but I was always

against their being shot; they are exceedingly valuable, and are worth 9 or 10 rupees a day each when trained. A trained elephant is equal to 50 coolies in point of work.

2288. Do you think it desirable to let the elephants run wild so long as there is forest for them, or do you approve of keeping them in the cultivated forests?—No, certainly not.

2289. I understand you think it is desirable that elephants should be left to grow wild where there is wild forest for them?—Yes, and that they should be caught, and not shot.

2290. Is it that on account of their requiring so many years to grow and requiring so much to keep them, you would rather that they grew wild than tame?—They rarely breed in the tame state.

2291. Have you at all addressed yourself to the question of the village cultivation of wood, as compared with the forest cultivation?—To the general question I have given consideration with reference to the subject of rainfall and climate; but village forests were more under the Board of Revenue; the forest officers had only charge of the reserved and first and second-class forests.

2292. That is to say, where a small district of forest was held in connection with the village, that is not treated as coming under the forest department, but is left to the villagers?—Yes, that is left to the village.

2293. And the fees they pay for cutting down the wood go into ordinary revenue?—They go into ordinary revenue or local funds.

2294. They are not subject to any conservancy?—Not the village forests generally.

2295. Have you considered independently of the village forests, the question of the cultivation of timber for each village for the purpose of supplying each tract of country with timber?—That is a very large question. The forest officers have been fully occupied with the large areas which they have had to deal with, and the village tracts did not come properly within their duties.

2296. You have not been asked, then, by the Government to go into the question of the village cultivation of timber?—Only in the way of advice and supplying seeds and general recommendations.

2297. Do you know whether that has been pursued at all in Madras?—The Board of Revenue have held out inducements to villagers to plant topes and groves by giving land rent-free for a certain number of years, and in some cases advances for wells. They have been exceedingly anxious to extend the topes and village forests.

2298. Do you consider that great increase of wealth and other advantages would result from the village cultivation of timber as compared with keeping up tracts of forest?—They cultivate fruit trees more, and other wood sufficient for their own wants; they do not look forward to providing for the next generation.

2299. Do you consider that any great advantages would result from the villagers cultivating a certain quantity of timber?—I think it is highly desirable both for their own use and for climatic considerations.

2300. What do you think would be the general effect of village cultivation, not in large areas but in small areas?—We see that to some extent in the North West, and in the Punjab, great inducements are being held out; but the extraordinary

dinary pressure for wood, on account of the new railways, has led to a diminution; the villagers have been induced to sell their trees.

2301. What are the effects that you see or would anticipate from the diffused cultivation by village communities of timber and wood?—The good effects would be to improve the climate, and supply the wants of the people.

2302. In what respect is the climate improved?—There is more moisture in the air from the presence of trees, less suffering from the hot winds, and less desiccation of the ground.

2303. Do you think that it would be more beneficial if the Government, instead of keeping up an enormous establishment to teach others, or to manage these great forests, were to apply this establishment to the village cultivation or general cultivation of wood and timber?—It is a little difficult to see how the forest officers could directly teach the villagers. The forests under the care of our officers are demarcated reserves. There is a constant and brisk demand for wood, which they are scarcely able to meet sometimes.

2304. But have any steps been taken by the Government to avail themselves of your knowledge and experience, to communicate that knowledge and experience to the agricultural population of the country?—Yes; I may say that we have been frequently communicated with in order to assist the villagers, but not by direct management; their land is not under our control.

2305. Has any information been given to them as to the proper mode of grouping trees together, and the proper mode of cultivating them?—Circulars in the vernacular have been circulated by the collectors and civil officers, recommending particular trees for particular soils, and the agricultural societies of the different provinces have distributed seeds. Some of the wealthier zemindars have done a good deal, and they take a pride in having trees.

2306. Have you seen any of the wood cultivation or timber cultivation in Oude?—I have been at Lucknow, but was only there for two days.

2307. Do you know whether Oude is considered in advance of all the rest of India in its cultivation of wood?—Trees grow well there.

2308. Do you know that there has been a more systematic village cultivation of wood in Oude than in any part of India?—I have been told so.

2309. Do you know whether there is any report on that cultivation that is applicable to the rest of India?—I think that there is a report upon the groves and tops in Oude printed recently.

2310. You have not had the opportunity of visiting them?—I have only seen them in passing through.

2311. Did it strike you as being superior cultivation?—It is a climate favourable to the growth of trees, as compared with the Punjab.

2312. Is it that the trees tend to produce the climate, or is the climate there without the trees?—The climate is there with the trees.

2313. Do you anticipate, from the general system that you have been describing, that in future years the produce of the forests, as far as you know, will be greater than it has been?—I think that it will go on steadily increasing. I am confident it will.

2314. Can you form any estimate of the rate of the increase, or the character of the increase?—I think that the rate of the present increase 0.59.

will continue. I have no data for saying that it will be larger, although I expect it will.

2315. Do you think that the increase that we have been informed of is due to any special circumstances, such as the demand for wood for the construction of the railways, or any other special circumstances, or that it is the natural increase and re-productiveness of the forests?—I think it is from the productiveness of the forests, which had been entirely neglected, and their resources not brought to account, as well as from the increased demand for constructive material.

2316. But what I am asking you is whether the increase results from the improved growth, or whether it is that in the construction of the railways there has been a general searching out of the trees capable of being cut by going very deep into the forests all over the country where the railways have extended?—There has, no doubt, been an excessive pressure upon the forests, by reason of the formation of the railways. Forest produce has become valuable and enhanced in price, and the demand is certain to continue. Both causes have tended to increase the revenue.

2317. Would that be probably due to the fact that the price is enhanced from the diminution of timber?—I think not. I think it is from the cause that you mentioned, the great demand for wood, but also from the enhanced value of all minor forest produce.

2318. What do you mean by minor forest produce?—I mean gums, dyes, oils, lacs, bees'-wax, &c., which were formerly not brought to account at all. I anticipate considerably increased revenue from these sources.

2319. Do the Government now make a charge for collecting these products out of the forests?—Formerly any person brought away ivory or bees'-wax or anything that he chose from the forest; now in most Provinces they are put up to auction.

2320. You mean that the right to collect in a limited area is put up to auction?—Yes; always in a very small area, so as to prevent monopoly.

2321. So that each purchaser could work on the ground that he purchased?—Yes.

2322. Can you give us any idea of the increase of revenue arising from the selling of all these petty forestal rights?—It has been very considerable in certain parts. In the North West Provinces, I cannot trust myself with the figures, but I know it has been very large, something like 70,000 rupees last year. Also in Oude and Central Provinces.

2323. Do you anticipate that that kind of revenue will increase?—I do.

2324. From being under Government control?—From being brought under Government control, skilful management, and systematic direction.

2325. Sir D. Wedderburn.] I suppose at the time when the attention of the Government was first directed to the forests, denudation had gone on to such an extent that there was not only a great scarcity of timber and fuel, but the climate was being seriously affected?—Yes, the climate was being seriously affected in my opinion and in that of many others. The subject was taken up by the British Association several years ago, and there have been different reports on it.

2326. The rainfall had diminished very considerably, and the climate was becoming more arid?—There was reason to believe so.

2327. I understood you to say that, in 1855, the

Mr.
H. Claghorn,
M.D.
25 April
1871.

the Wellington Barracks at Jackatalla were at a standstill from the want of timber for beams?—Yes.

2328. I do not quite understand that, because I have seen myself, in that same neighbourhood, many trees which must have been quite fit for timber at that date; can you explain that circumstance?—They wanted large teak timber for the Wellington Barracks, and had very great difficulty in obtaining it seasoned, and bringing it up from below.

2329. Then, how were the barracks ultimately completed?—They were completed by special arrangements; timber carts were prepared, and logs were brought from the other side of the Neilgherries.

2330. Then with regard to planting, I should like to know what kinds of trees have been chiefly planted?—The first teak plantation of magnitude was that commenced by the late Mr. Conolly, in Malabar in 1842, now a very large and flourishing plantation, which is paying its expenses and a great deal more. Subsequently we have planted sandal-wood in Mysore, mahogany in Bengal, red sanders and other trees in Madras. Every year a per-centage of income is devoted to planting.

2331. Do you plant any deodar?—In the intra-montane valleys of the Himalaya, it has been planted.

2332. Does cinchona come under your department?—That is medicinal; its introduction has been a great success, but that is not in my department.

2333. Do you consider that there is at present under timber a sufficient extent of land for climatic purposes?—I think that we are in a more favourable condition than we were 10 years ago; the wooded crests of the ghâts are preserved, and the fringes of the water-courses are specially preserved by orders from the Governor General and Secretary of State. Rules have been adopted, that forests at certain heights are not to be denuded, with reference to the canal irrigation below.

2334. I suppose that even if the forest department were a losing concern, so far as revenue is concerned, it would still be necessary for climatic purposes to maintain it?—I consider that the Forest Department does great service altogether independent of revenue.

2335. Then with regard to the wild elephants, does the capture of wild elephants in any part of India constitute a function of the Forest Department?—It has once or twice been entrusted to forest officers, who from their position were specially able to perform this duty.

2336. Is there any probability of their soon becoming extinct if not protected?—I think that they are rapidly decreasing in number in the Madras Presidency.

2337. Do you consider that the mischief which they do, when in a wild state, will be more than made up by the services which they perform when captured and trained?—It is only the unruly male elephant that does the mischief, the females seldom do any.

2338. I mean mischief to the young timber?—The Rajah of Travancore and the Rajah of Cochin preserve their elephants with great care. On the other hand, our legislation has generally tended towards destroying them.

2339. The point that I want to inquire into is, whether that is not a mistaken policy?—I consider it so.

2340. Mr. Dickenson.] Does the Government insure any crops of timber?—No; but it takes very great precautions to prevent fire.

2341. Mr. Bourke.] When part of the forest is cut down, is that part planted immediately, or is only a portion of it planted?—In Malabar 100 acres of teak forest are planted every year, and 400 acres in Burmah, and that is done in a compact form; not in the part which was cut immediately before, but on a site previously selected.

2342. Of course with regard to deodar, when you cut them down, if you want more trees to grow again, you have got to plant them; is that so with regard to teak, or will it grow from stumps?—Teak grows from stump shoots.

2343. So that it is not necessary to plant them?—It is not essential, but they are seldom so straight and so good when they grow in that way.

2344. Sir D. Wedderburn.] But I suppose that all these trees will grow from seeds?—Yes; we propagate them by sowing every year.

2345. Mr. Beach.] What timber chiefly grows in the Madras Presidency?—There are a great variety of useful woods; those which are most esteemed next to teak, are black wood, or rose-wood, satin wood, and ebony; and I could give a long list of native names.

2346. Teak is the most profitable?—By far the most valuable.

2347. Before the organisation of the departmental management could the system of licenses have been maintained to the same extent that it has been; that is, could the same profits have been realised continuously?—Not continuously, because the forests were nearly exhausted.

2348. And they were getting more exhausted every year?—Rapidly.

2349. Mr. Fawcett.] I understood you that no licenses were granted now in first-class forests, such as teak forests?—No.

2350. But I suppose that in the other forests there are licenses granted?—There are, but in a modified form. The trees are marked and the numbers are carefully checked.

2351. We look upon these forests as a Government estate; of course we know that timber may be very recklessly and improperly sold if persons are very hardly pressed for money, and therefore it is very important to show how the revenue is obtained; in the accounts of India are the items separated in this way that you can tell how much is produced by the Government selling timber, and how much is obtained by the Government granting licenses?—There are, I think, nine heads of revenue. The main one is that of selling timber. In the different provinces there are different sources of revenue such as the minor forest produce that I spoke of. In Burmah there is the duty on timber from beyond the boundaries. In some cases, Scinde for instance, there is the pasturage of cattle in the forests under certain restrictions, camels, sheep, and goats, which pay a small sum for so many months' pasturage.

2352. And so much, I suppose, is put down for licenses?—Yes.

2353. Now, from your having taken a scientific interest in forests, of course these items of expenditure would at once give you a clue as to whether the forests were being uneconomically and recklessly managed. If, for instance, one year you suddenly found that there was a very great amount put down more than usual for the selling of licenses, you would begin to think that Government

Government was using up its forest resources too quickly, would you not?—Yes.

2354. Therefore you think that that is eminently a thing, so far as revenue considerations are concerned, to look into?—I consider that the license system is, on the whole, objectionable, and should be reduced to a minimum.

2355. But you consider, looking into the relative amount of these items, the particular thing which the department of revenue ought carefully to scrutinise, in order to give an idea how the profits are made?—It is part of the working plan.

2356. So far as revenue is concerned?—Yes.

2357. You would be, perhaps, surprised to hear that there is no such record of these items kept at the India Office?—The items are furnished by each conservator to the Government of India, and they are included in the budget estimate drawn up there.

2358. You alluded to the fact that the Rajah of Travancore was managing his forests very carefully; but should you say that he managed them as well as our Government forests?—He has a European conservator, who is in continual correspondence with the British officers.

*2359. Has that European conservator worked through the agency of European assistants, or of native assistants?—He is a German.

2360. Whom does he employ under him?—One or two Europeans, and the rest are natives, I think.

2361. Then he does not employ so large a proportion of Europeans as we do?—No, being a native ruler.

2362. Have you ever, as a mere matter of revenue, looked into the comparative expense of managing those forests that you say are as well managed under native agency as ours are, compared with the expense of managing our own forests?—No; I was fully occupied with my own duties.

2363. I suppose there is no possibility of obtaining an estimate of the revenue and expenditure in the case of the Travancore, so as to compare it with the revenue and expenditure in our own case?—I should doubt if it be published in detail.

2364. Do you think that the aggregate would be?—The Travancore Government publish every year a brief *résumé* of their finances.

2365. With regard to the Government forests, it appears that the expenditure amounts, I think it was stated, to 80 per cent. of the revenue; do you know whether in those Budget statements in Travancore the expense of managing the forests is 80 per cent. of the revenue?—I do not know.

2366. Do you think you could furnish the Committee with a copy of the Budget which is annually laid before Travancore; do you think that is a document which could be obtained?—I do not know if it is procurable.

2367. They will have a copy probably at the India Office?—Possibly.

2368. You of course, as a scientific man, think that certain duties connected with forest management, require a very high kind of training; a man should be a botanist, for instance?—Yes.

Mr.
H. Claghorn,

THE RIGHT HONOURABLE ACTON SMEE AYRTON, IN THE CHAIR.

MR. HUGH CLEGHORN, M.D., re-called ; and further Examined.

Mr. H.
Cleghorn,
M.D.

28 April
1871.

2369. Sir J. Elphinstone.] THE questions I am going to put to you will be for the purpose of elucidating the various descriptions of useful woods which it may be practicable to grow with profit in the Government forests, and to know whether your attention has been directed to them; I will begin with sâl; will you kindly describe the nature of the sâl wood and where it is found?—The sâl wood is found in that large tract, the Terai of the Himalaya which is marked red on the map, and extends from Assam to the Kangra valley. This belt of sâl is broadest in the east, and becomes narrower as we proceed north-west; the northern limit is between the Sutlej and the Beas: the southern near Vizagapatam.

2370. What size does the sâl attain to?—The sâl attains a very large size in the forests of Oude and of the Terai. It grows very close; it propagates itself in a manner different from other trees: the seeds fall viviparous into the ground, so that there is comparatively little trouble in the management of the sâl forests. In fact, planting is not required as in other forests. The tree is not easily exterminated.

2371. To what use is it applied?—Sâl wood is used for engineering purposes, for ship building, and very extensively for house building in Upper India.

2372. It takes some time seasoning, does it not?—It takes a long time to season, and is very peculiar in its behaviour; it becomes seasoned after a course of years, but if afterwards floated down, it absorbs water and gains weight as no other wood, that I am aware of, does.

2373. Does that operate to deteriorate the quality of the wood?—I have no special facts to give on that point.

2374. Is it peculiarly liable to the attacks of the white ant?—It is liable to the attacks of certain insects.

2375. Then we come to teak; as far as you can compute, what quantity of teak may you have in the forests?—Teak is by far the most valuable of all Indian woods. The great supply of teak is in British Burmah, and beyond the frontier, and in the forests of Malabar and

Canara. There is teak also in the Central Provinces, but comparatively of small growth.

2376. Is there teak in the Nerbudda forests?—There is teak in the Nerbudda forests.

2377. How early does teak come to maturity to be useful?—The first-class teak, for ship building, comes to maturity in from 70 to 80 years.

2378. And for house building?—For house building, there is a ready sale for the thinnings in 20 years.

2379. It grows very readily, does it not?—It is now found to grow very readily. We have one large plantation in Malabar, and I am happy to say that planting operations to a large extent are decided upon in British Burmah, above Rangoon, and elsewhere.

2380. The forests had been very much destroyed before they came under your superintendence, had they not?—Very much exhausted.

2381. They were subjected to a system which I think is called kumari cultivation, is it not?—Yes.

2382. What is called in Ceylon, "Cheena"?—Yes.

2383. Will you describe that system?—That system of cultivation was a cutting down and burning of the forests to obtain one year's crop of millet, or some inferior grain; of course it was very wasteful.

2384. That, I understand, has been put a stop to?—In all the superior forests it is strictly forbidden.

2385. And is there any system by which those lands, which are being subjected to the kumari cultivation, are being planted up?—When they are favourably situated as regards rivers and roads, the Forest Department attempts the restoration.

2386. Are those lands under the superintendence of the head man of the district, and rather under their care; are they answerable in any degree for preventing their invasion by cattle, and robbery by the natives?—The Forest Department and the revenue authorities work together.

together. They are intimately blended; they must co-operate.

2387. If I recollect rightly, the East India Company had an officer stationed at Cochin for the purpose of collecting teak to build men-of-war at Bombay?—He was a timber agent.

2388. And latterly it became so difficult to obtain timber of the description that was required, that after the building of the last line of battle ship built at Bombay, the agent was withdrawn, and for some years, until your department was created, the forests were practically unattended to?—That is so.

2389. Now, with regard to sandal wood, is there still a considerable supply of sandal wood?—Sandal wood is confined in its growth to the plateau of Mysore and the adjoining country. There is a very large quantity, yielding an annual revenue of between one and two lacs, between 10,000 *l.* and perhaps 15,000 *l.* to the Mysore State. There is some also in British territory.

2390. Does not the growth of sandal wood extend as far as to Coorg?—Yes; and some part of the Salem collectorate.

2391. And as far north as North Canara?—Yes.

2392. I think you stated that there was a considerable revenue derived from sandal wood?—Yes.

2393. Are there any measures taken for the propagation of sandal wood?—Plantations have been formed within the last few years which are being extended annually.

2394. Is that a very slow-growing wood?—It reaches maturity in about 20 years; it is a small tree.

2395. But it is of value for the extracting of essential oil, is it not, in its earlier stages?—Yes, it is sold by weight.

2396. But in its younger or earlier state it is useful for the extraction of essential oil, is it not?—It is; the chips, fragments, and saw-dust are all used for the extraction of oil.

2397. Then there is no difficulty in propagating that to any extent?—It is being propagated successfully in Mysore and Coimbatore.

2398. Then with regard to black-wood, how does that stand?—Black-wood stands second in point of value after teak as a timber tree on the Malabar coast, and probably in Burmah also. It is of great value for ordnance purposes, for house building, and for carved furniture in Bombay; and it is imported into this country by several cabinet-makers.

2399. Can it be supplied in large size?—It can be obtained of large size, as large as teak.

2400. Has any effort been made for the propagation of black-wood?—It is now planted in the same situation and often alongside of the teak.

2401. Then what do you say as to ebony?—Ebony is a tree of great value; it is also sold by weight; the black-heart-wood only is sold, and it is exported to some little extent to this country as a fancy wood.

2402. Can the cultivation of ebony be extended?—It can be; but it has not yet been found necessary.

2403. It requires very many years before it can be properly cultivated?—Yes.

2404. Then there are large plantations of chinchona?—The chinchona cultivation has been a remarkable success on the Neilgherry Hills, at Darjeeling, in Ceylon, and elsewhere.

2405. It is of extremely rapid growth?—It is.

2406. And at three or four years old it is capable of producing the bark of commerce?—The bark of commerce is obtained at an early age.

2407. Then is it not a fact that the leaves are of great value as a febrifuge?—It is expected that the leaves may yield a febrifuge to the masses; the alkaloid will be extracted in large quantities from the bark.

2408. You are propagating the chinchona to a great extent?—The cultivation is being extended by forest officers, but the introduction was not originally by the Forest Department.

2409. The introduction was in consequence of Mr. Markham's researches on the slopes of the Andes, was it not?—Yes, he was the introducer.

2410. Have private individuals taken to the cultivation of chinchona?—There are numerous plantations being raised by private enterprise.

2411. And has it affected the value of quinine?—It is confidently expected that it will do so; there has not been time yet.

2412. Has the manufacture of quinine ever been undertaken in India?—Yes. There is a scientific chemist, a quinologist (Mr. Broughton), at present engaged in extracting the alkaloid.

2413. Where is he placed?—At Ootacamund, on the Neilgherries.

2414. What extent of chinchona may there be on the Neilgherries?—I believe at least 2,000 acres. Of this 1,200 acres belong to Government.

2415. Are the plantations upon the level, or are they on the slopes?—They are in various directions, chiefly to the west.

2416. On the Sisapara side?—Yes, chiefly on the slopes looking towards Wynad.

2417. To what altitude do they reach?—The different species grow at different elevations; the higher slopes are the most suitable.

2418. They produce the alkaloid most?—Yes.

2419. Then you anticipate very great advantages and profit from the extension of the chinchona cultivation?—Great benefit to the masses from the facility of obtaining this febrifuge.

2420. You have no doubt that it is now sufficiently started to make its own way as an article of cultivation?—No doubt whatever.

2421. With regard to bamboo, there are various varieties of bamboo, are there not?—There are a considerable number of species.

2422. There is the Rangoon bamboo of very great size, large enough for buckets and various other uses of that sort?—Yes.

2423. And what is called the she-bamboo, which is the most common I suppose, and there is what is erroneously called the he-bamboo, which is a different species?—Yes, and is especially used for handles of hog spears and lance shafts.

2424. Will you describe the different species of bamboo that can be brought to commercial value?—There are at least seven or eight species which are used for various purposes of domestic economy, for scaling ladders and many other purposes.

2425. In fact it is next to the cocoa nut, I suppose, the most valuable wood in India for universal purposes?—For the natives of the country there are an infinite variety of uses to which it may be applied.

2426. The he-bamboo is a peculiarly useful wood, is it not?—It is much valued.

Mr. H.
Clegburn,
M.D.

28 April
1871.

Mr. H.
Cleghorn,
M.D.
—
28 April
1871.

2427. It combines toughness and durability, with extreme lightness?—Yes.

2428. Then there are rattans?—They grow in great abundance in the forests of Malabar.

2429. That is a species of bamboo, is it not?—It is a species of palm, the stem of which runs along the ground.

2430. And for what lengths?—Great lengths; 80 to 100 feet or more.

2431. That is a product of very great value?—It is a product of considerable value.

2432. There is a very large trade in rattans from the Straits of Singapore to China; it forms a very valuable article of export?—It does.

2433. Then there is the larger rattan, which is commonly used for walking sticks, that is also found in the forests there?—Yes; the *Calamus rotang*.

2434. It is a larger description of rattan, and is considerably exported, is it not?—Yes.

2435. Do the Government derive any revenue from rattans?—It is at present small.

2436. Is it not the case that the Malay chiefs derive a considerable revenue from granting the privilege of cutting rattans in their forests?—I believe it is so; that is in the Straits' Settlement, and not under the jurisdiction of the Forest Department.

2437. I suppose it would be worth the Government's while to give licenses in the same way?—I believe rattans will eventually become a larger article of trade.

2438. Then cassia lignea exists to a considerable extent in the Malabar forests, does it not?—Yes. That is an inferior variety of bark resembling cinnamon in smell and appearance.

2439. Is there any revenue derived from that?—There is a small revenue derived from it; it comes under the head of minor forest produce.

2440. But it figures pretty extensively in the items of the province of Malabar, does it not?—It does.

2441. And if the attention of the Government was turned to that, some revenue might be derived from it?—I believe so.

2442. Does wild cinnamon exist in those forests?—It does.

2443. Is it cut to any advantage?—There is not much sold at present, but for all such articles there is a coming demand.

2444. Then cardamoms exist pretty extensively in the Malabar forests?—They exist spontaneously in the jungles where coffee planters have settled; in Coorg and Wynaad there is a considerable cultivation of cardamoms, and revenue is derived from them.

2445. Is there an export duty on cardamoms?—There is an export duty of 200 rupees per cwt.; and 40 rupees per cwt. of bastard cardamoms.

2446. Are they gathered by license, or in what way does the revenue accrue to the Government?—The Rajah of Travancore derives revenue from cardamoms; we have hitherto allowed the natives to collect them pretty much without supervision. In Coorg the jungles are farmed out.

2447. But the cardamoms form no inconsiderable item in the revenues of Travancore?—That is so.

2448. That is another minor source of revenue to which we may look?—Certainly.

2449. Then pepper?—Pepper is a natural

product of the Malabar forests, and a great article of commerce; the collection of pepper has been under the civil authorities; most of the pepper jungles in Malabar are private property.

2450. But that is also a source of revenue?—It is.

2451. Then with regard to bark for tanning, are there any woods that produce good bark for tanning?—There are several; the tanners are supplied by various species of *Cassia*, and there is no doubt that tanning materials are found in abundance.

2452. The Government used to tan their own accoutrements, did they not?—Yes.

2453. The system was stopped from motives of economy, was it not?—Yes.

2454. But the leather was perfectly good?—I believe the leather is good in some parts of India. The great heat is not favourable to tanning in the south, but at Meerut in the North West Provinces tanning is very successful.

2455. What are the woods that produce the most tanning?—Various species of cassia and acacia, (*cassia auriculata*, *acacia catechu*), and other species.

2456. Are those trees capable of reproduction?—Certainly.

2457. And does the bark contain a sufficient quantity of tanning materials to make it an article of commercial value for the use of tanners in this country?—The native leather merchants remove under permits from forest officers in certain places the bark of trees marked out for the purpose; chiefly the *cassia auriculata* and the *acacia catechu*.

2458. Does gutta percha exist in any of the forests of India?—Gutta percha was discovered in the forests near Singapore, by Doctor Montgomery, and the forests there have been, I understand, very much reduced. Caoutchouc and gums of similar properties are found largely in Assam.

2459. Have you taken any measures for the purpose of the cultivation of the gutta percha or the caoutchouc?—Very recently rules have been laid down for the periodical tapping of caoutchouc trees in Assam, that care should be taken not to overtax the production of the forests.

2460. Then there is a product in India very much used as a substitute for pitch, called dammer; what does that come from?—Dammer is yielded from various species of the wood-oil family.

2461. Is dammer the basis of any other varnishes or pigments that are used in this country?—Yes; it is used by the varnish makers.

2462. Are there any valuable gums in the forests of India?—There is gum gamboge, gumkino, and many other species. Those are the two best known for medicinal purposes, and for dyeing. Kino is used in calico printing, and gamboge is a pigment and a medicine.

2463. Are there any trees in India, the products of which produce vegetable colours?—There are several dye stuffs in addition to those which have been mentioned.

2464. Resembling logwood?—Yes, there is the chay-root, and there are other species.

2465. All of which might be turned to account under the Forest Department?—Yes.

2466. With regard to honey, there is a very large production of honey in the forests, is there not?—A very large production of honey and bees-wax.

2467. That

2467. That is generally sought for, I think, by the aboriginal tribes?—Yes, the Hill tribes.

2468. I suppose that they have a sort of titular rights over the forests for the pursuit of them?—They have never been interfered with in their prescriptive right to collect honey.

2469. And perhaps it would not be politic to interfere with those aboriginal tribes?—The native chiefs levy a tribute on wild honey and bees-wax, but we do not.

2470. What is your opinion as to the advisability of obtaining some revenue from that source?—It might require consideration by the local officers, if there was a small number of natives and a large quantity of wax; but if there was only a small quantity, I should consider it would not be worth while to interfere.

2471. The pimento has been introduced into India, has it not?—Yes.

2472. How does it answer?—It has only been introduced very sparingly on the western coast, into Travancore and Cochin.

2473. The result has been favourable, has it not?—It is only grown in gardens, and not sufficiently for commerce.

2474. Is the bread-fruit tree cultivated?—It is cultivated and grows well on the western coast.

2475. That is more a garden tree also, is it not?—Yes.

2476. Then there is the betel-nut tree?—The betel-nut tree comes entirely under the collectors as a cultivated plant; the cocoa-nut and betel-palm belong to the land revenue.

2477. But are there not many situations in the low ranges of hills where the betel nut would grow profitably?—Certainly, but that would not come under the Forest Department, but under the land revenue.

2478. But if it was planted in the grounds that were under the jurisdiction of the Forest Department, it would then come under that department, I suppose?—It would pay land-tax and come under the collectors.

2479. Still it can be cultivated to considerable advantage?—Certainly.

2480. It is a most valuable tree?—Yes.

2481. The cocoa-nut tree exists entirely on private lands?—Yes.

2482. The lands on which it can grow are entirely private property?—Yes.

2483. Is that the case with regard to the palmyra tree?—The palmyra tree also does not come under the Forest Department.

2484. It is an extremely useful wood and resists the action of the sea for many years, does it not?—It is much used for rafters of houses and other purposes.

2485. And also for fishing stakes and harbour staging, and other purposes of that sort?—Yes.

2486. Then there is a very useful tree, which I understand is coming into very great use, the casuarina?—Yes; the beef-wood is the popular name for it; it is a tree which has been planted on the sandy shores north and south of Madras, and at various places on the opposite coast.

2487. It is a tree of very rapid growth?—Of rapid growth, and the timber of great hardness. Private companies have undertaken the planting in the immediate neighbourhood of Madras, where it grows freely.

2488. There are large plantations near Pulicat for the purpose of supplying fire wood and house-building material?—Yes.

2489. At what age does the casuarina become fit for household purposes?—The plantations are yet comparatively young, but the thinnings are being sold at the age of 10 or 12 years.

2490. Profitably?—I believe so.

2491. It is quite large enough for building purposes?—Yes, 25 feet and 30 feet.

2492. Is that subject to the ravages of white ants?—I have never seen it affected by white ants. It has the peculiar property of durability under water.

2493. It is a particularly close-grained wood, is it not?—Very hard; it turns the edge of the axe.

2494. It has a peculiarity which few fast growing trees have, of being extremely tough and hard, and durable?—Yes.

2495. I should like to ask you now what other woods you consider beyond those which I have asked you questions on it would be useful for the Forest Department to conserve and propagate?—There are seven or eight of the better kinds of wood reserved in each province; and in Madras we reserve the satin wood (that is one that has not been mentioned) for picture frames and other purposes, there is a considerable demand for it.

2496. What size does the satin wood in India grow?—Fifteen inches diameter is the largest I have seen; it is very useful for picture frames, and resembles American maple.

2497. What lengths does it attain?—I have obtained sufficient scantling for ordnance purposes (for trial for gun carriages) on several occasions.

2498. Is it made use of in the Gun Carriage Department?—It has been tried, but there is not much demand for that; for picture frames and fancy purposes it is much used.

2499. With regard to charcoal, do you manufacture charcoal, or permit it to be manufactured?—The forest officers themselves do not manufacture charcoal; they permit the manufacture under certain rules, in certain places, and at certain times.

2500. Is there not a wood in India which is particularly valuable for the manufacture of gunpowder charcoal?—There are certain kinds of dog-wood and allied species found to be useful for that purpose.

2501. Where does that wood grow?—I cannot specify particular localities at this moment. We have tried various species for the manufacture of charcoal for gunpowder; experiments have been made from time to time. I believe the best occurs in the Himalaya.

2502. The Indian dog-wood is considered to produce the best charcoal in the world for gunpowder purposes, is it not?—It is considered remarkably suitable.

2503. And could that be increased in cultivation?—Our attention has not been particularly turned to that, as yet.

2504. Is it a plant or a tree?—A small tree; there is also a small bush much used for the purpose; the dog-wood is a tree.

2505. What size is the tree?—Fifteen feet. Very little has been done yet by the Forest Department in that direction.

2506. It is a direction in which you could profitably extend your cultivation?—Yes.

2507. You were kindly proceeding to enumerate the different woods which I had omitted, which you considered it would be useful to conserve and propagate, and you began with the

1871.

satin wood; have you any other to mention?—I might mention many others; there is the red cedar, *Cedrela Toona*, and other species of the mahogany family which may be turned to account, and which are reserved.

2508. Is the jack-wood cultivated?—Yes, the jack-wood, like the palmyra and cocoa-nut comes under garden cultivation.

2509. Have you any variety of the mahogany in India?—The seeds of the mahogany tree have been received in considerable quantity through the Colonial Office; they were sent out to India from the West India Islands within the last few years, and plantations have been commenced in Bengal and other parts; the true mahogany is not indigenous in India.

2510. There is a wood in Ceylon called walburuta, which is a species of satin wood; are you acquainted with that?—I am not acquainted with it; Ceylon is entirely a separate administration.

2511. I wish to know whether in the forests of Malabar some of the most useful of the woods in Ceylon are found?—Many of them are.

2512. Is the kino found?—Yes. *Pterocarpus marsupium*.

2513. Then there is the iron wood?—We have iron wood; it is a popular term given to various very hard trees; there is usually an iron wood in each province.

2514. The iron wood I mean is a very large tree, which grows sometimes to three or four feet in diameter, and is practically imperishable?—I cannot answer as to that.

2515. Then there is the dhoom?—I am acquainted with it; it belongs to the wood-oil tribe.

2516. It grows on ridges?—It is very sparingly found in Malabar; it is nearly peculiar to Ceylon.

2517. Generally speaking, you entertain a very strong opinion that from most of those woods some sources of revenue may be obtained, which will progressively in the aggregate yield a large forest revenue?—Most certainly I do; individually they will be small in amount, but collectively they will amount to a large sum.

2518. How long is it since you have had charge of the Forest Department?—Since its institution, in 1856, at Madras.

2519. At that time it was not self-supporting?—There was little or no revenue to begin with.

2520. And the result of your proceedings up to this time has been to establish a net revenue of how much?—This year's Budget shows 573,000 *l.* of gross receipts, and about 121,000 *l.* of net revenue.

2521. Your operations extend over an enormous extent of country?—It is difficult to convey to the Committee a clear impression of the vast extent of country which is embraced in the ranges of all the forest officers.

2522. I suppose it is difficult even to form an approximate opinion as to the extent?—The reserves have as yet only been demarcated in two or three of the provinces. The work is going on and will take some years to be completed.

2523. But we have it in evidence that there is something like 37,000 square miles of forest of a first-class description, which is considerably more than the whole superficial area of the island of Ireland or of Ceylon?—Yes, certainly.

2524. The consequence of that must naturally

be that until these forests are brought into a complete system, the expenses must absorb a very large amount of the gross results?—Certainly. The expenses incurred at first to place those forests, which had been previously neglected, or left in a state of nature, or reduced by mismanagement, in a high state of production, are necessarily large, and will not recur again or to a less extent.

2525. But viewing it in a broader sense, I suppose it is your opinion that there are very considerable benefits accruing to the country from the conservation of these forests?—I venture to believe that entirely independent of revenue there is a very great benefit to the prosperity of the country, and the successful cultivation of land from the preserving of the forests.

2526. Looking at the question from that point of view, you consider that the net revenue is but a very small portion of the advantage derived by India from the conservation of the forests?—Quite so; that has been the tenor of all the instructions that we have received. We were not to look mainly to revenue, but to keep up a permanent and regular supply for the wants of the people, having in view also the maintenance of the forests for climatic and other considerations.

2527. The maintenance of those forests has a very great influence on the regularity of the water springs, has it not?—I think there can be no doubt of that.

2528. And that system of Kumari cultivation, by laying bare the upper parts of the slopes and the crests of the mountains tended in a very great measure to reduce the supply of water in the districts where that practice was enforced?—It threatened to produce serious results, and the natives themselves were apprehensive on the subject.

2529. And the natives view with great satisfaction the conservation of those forests from which they derive the springs with which they irrigate their land?—I believe that I may certainly say so.

2530. Mr. J. B. Smith.] Are most of these forests accessible to roads and rivers?—When the reserves which have been formed are not on trunk roads, or near large rivers, the forest officers spend much time and money in making them accessible.

2531. You mean, that in the case of rivers which are not navigable they have made them so?—A liberal allowance has been made for improving the communications, blasting the rocks, and otherwise developing the resources.

2532. So that the timber could be floated down the rivers?—Yes.

2533. The value of the timber very much depends upon the cost of bringing it to market, does it not?—It very largely depends upon that.

2534. I think you stated, in answer to Sir David Wedderburn, that there was great difficulty in procuring timber large enough for the Wellington Barracks at Jackatallah?—Yes.

2535. And that it had to be conveyed from the Neilgherries?—From the western side of the Neilgherries.

2536. Would that be an expensive process?—It had to be carried up the Ghâts; it was necessarily a very expensive process.

2537. Were there no forests nearer than that?—There were no forests of teak timber, which grows in the lower valleys.

2538. Therefore,

2538. Therefore, the supply of timber to those barracks must have been very expensive?—It was expensive.

2539. Are there supplies of wood, in most districts, sufficient for fuel for the people?—In some districts there is a great abundance of fuel. In other districts the fuel difficulty is great, more especially in the Punjab, and all in the drier parts of India.

2540. In consequence of that deficiency, is it not a common thing for the people to burn their manure?—Certainly, it is a very prevalent custom.

2541. And where that is practised, the land is robbed of what ought to be returned to it?—Yes.

2542. And necessarily the production in those parts of the country must be very much diminished?—I consider certainly that it is so.

2543. And therefore the cultivation of timber is a most important object in that respect?—I most certainly take that view very strongly.

2544. In fact the supply of timber for fuel would increase the productiveness of the land, the cultivation of the land for grain or seeds or?—I consider that it has many uses, such as supplying leaves for manure and many other purposes.

2545. Are means taken in those districts where the supply of wood is insufficient to supply that deficiency?—The revenue officer, the engineer officer, and the forest officer are in the habit of consulting as to the needs of the population, and doing what is necessary to meet the demand.

2546. If there is teak timber which is too valuable to be cut up, the loppings might be sold?—The loppings are sold, and the fragments, slabs, and side pieces are sold by auction and are readily bought.

2547. Are those sold for fuel?—No, for house building and for furniture.

2548. And the smaller loppings would suit for fuel?—Yes.

2549. Do you happen to know anything about the woods of the Central Provinces?—I know them by correspondence with the forest officers. I have not myself been in the Central Provinces.

2550. But the forests in the Central Provinces are the largest in India, are they not?—They are very extensive. The value of the timber is not so great as in Malabar, or Burmah, the returns are not so large.

2551. Do you mean that the timber is not so large?—The trees are not so lofty in their growth as in Malabar and in Burmah.

2552. But it is said that there are most valuable forests of teak timber in the Central Provinces?—That is quite true.

2553. And the value of that timber would very much depend upon the facility of getting it to market?—Most certainly.

2554. If there happened to be a river running through that province you would say that that would be a most valuable acquisition to it?—A navigable river would be a most valuable acquisition to it.

2555. You are aware that there is a considerable river which runs through those provinces, the Godavery, and also the Wurdah?—Yes.

2556. And it is on the banks of that that these forests are situated?—Yes, the Aherce forests.

2557. And is it not very desirable to render that river navigable for the purpose of floating down timber?—Yes.

0.59.

2558. And that would also reduce the price of timber very much?—I believe it would.

2559. I think you have stated that it is discovered that the growth of timber in all countries has a great effect upon the climate?—I think that is admitted by all physical geographers.

2560. It is found, I believe, in Spain, where the forests have been cut down, that the land has been almost dried up?—The ground has become baked, and the fertility has suffered. There was no provision for restoring the wood.

2561. Are means taken in different parts to correct this state of things?—That is one of the great objects of the Forest Department to keep up the permanent supply, to keep up the equilibrium of arboreal vegetation all over the country.

2562. Mr. Lyttelton.] I think I am right in saying that there are three principal sorts of trees in the old forests, teak, sal, and deodar?—Yes.

2563. And is it your opinion that we must always look to these three sorts of trees as the main source of our forest revenue, or at least for many years to come?—Those will yield the source, undoubtedly; the teak is of great value for shipbuilding and other purposes; the power of the oil to conserve iron; there always be a brisk trade in teak as long as ships are built of wood.

2564. Teak, you have told us, comes to maturity as timber in 70 or 80 years?—Yes; not less.

2565. When do the other two species come to maturity?—The deodar I should say in about the same time; the fine old deodar forests are seldom used before 70 or 80 years; the sal at an earlier age, perhaps 60 years.

2566. And until that period, in the present exhausted state of the forests, we cannot look to any great revenue from the sale of timber from these forests?—We are working upon a fixed plan, and we calculate that the present resources, without yielding to any unusual pressure, will keep the supply up to the present demand.

2567. When you speak of an exhausted forest, you mean denuded of all the older trees and many of the younger?—The older trees have been cut down; we have been obliged to bring timber from great distances in the Terai and the intra-montane valleys of the Himalaya.

2568. Still, in the remoter districts, there must be a great quantity of timber suitably for cutting still standing, is there not?—Yes; this year leases have been made with the Maharajah of Cashmere to obtain a portion of the supply from the Cashmere territory.

2569. Are you of opinion that the annual loppings are sufficient to defray the current expenditure of the conservancy?—The annual thinnings in certain districts of the teak plantations have been found sufficient to cover their expenses, teak being especially valuable.

2570. As regards the sal forests how is it?—In the sal forests, too, the thinning yields a very considerable return.

2571. There appears to be an unsatisfactory process going on in this respect, that the expenses of management are gaining upon the gross revenue; are you of opinion that we are approaching a period when that process will be arrested?—I stated that at first the expenses on introducing a sound system involved the opening of roads, the blasting of rocks, the purchase

1871.

of elephants and other expenses, which will not recur to the same extent.

2572. But can it be said that even with regard to that preliminary expenditure it is anything like completed?—I have no reason to expect that the expenditure will exceed the present amount.

2573. Is it the case that taking the whole extent of the forests in India the greater part of them are already under some sort of supervision?—I think that the greater part are now under organised supervision; we have been rapidly extending our organisation to all the better class of forests; we have also leased forests in the adjoining territories.

2574. So that in fact you are of opinion that we have reached the turning point?—I believe so.

2575. As to clearances, I suppose they are now limited by Government?—The clearances which were alluded to in the questions put to me as to the Kinnari cultivation are strictly prohibited in all the more valuable forests.

2576. Is it an ordinary case that forests are grown on soil which is suitable for cultivation, and which would repay the cost of clearance, or are they generally growing on poor soil?—The finer forests are on good soil; the teak and blackwood especially are on good soil; some of the forests in the Central Provinces are not on the best soil.

2577. But the Government discountenances clearance everywhere?—It discountenances clearance, unless it be for permanent cultivation.

2578. In the immediate neighbourhood of villages, for instance?—We do not limit clearance near a village, if there is to be permanent cultivation yielding land revenue.

2579. Mr. B. Denison: Have you any personal knowledge of the upper part of India, the Himalaya?—Yes; I have travelled from the Khyber Pass to Cape Comorin.

2580. I mean as to the forests?—I have spent two years in exploring the intramontane valleys of the Himalaya.

2581. Can you tell the Committee what has been done towards replanting the Punjab and the slopes of the Himalaya at all from Lord Dalhousie's time when attention was first given to it?—The replanting has been as yet to a limited extent in a few places in the Himalaya; but the forests are being demarcated and small jungle (chukki) reserved, and the cattle have been excluded and steps have been taken to prevent conflagrations and other mischief.

2582. Speaking generally, do you know whether any great change has been brought about in the Punjab from the replanting of trees since the acquisition of the country?—I believe that the planting of avenues, and especially along the canals, has been very successful.

2583. But I am afraid it is rather a worthless tree, the thorny babul?—It is being much planted, and promises to be useful.

2584. The best of the Deodar timber comes from territory which is not British?—Yes.

2585. And pays a duty to the native chiefs out of whose territory it is exported?—There are leases now with the Rajah of Chamba, with the Rajah of Terce, with the Maharajah of Cashmere, by which annual payments are made, and the rights of felling and conserving are acquired. Leases to the British Government I mean.

2586. They are under Government superintendence?—Yes, under range officers.

2587. In Kamaon the Government have forests of their own, have they not?—Yes.

2588. Have saw-mills worked by water-power been extensively introduced?—Yes, they have been on the Baree Doab Canal and in other parts of India. It is very desirable to increase the amount of saw machinery.

2589. Have you been brought officially in contact with the railway companies at all regarding the supply of fuel and timber for sleepers?—It has been a very important and difficult duty to meet the urgent demand for very large amounts of sleepers and of fuel.

2590. What woods chiefly have been supplied for the purpose of the sleepers?—For the sleepers in the Punjab and the north west the deodar is the chief wood; the softer pines are now being submitted to processes of impregnation which, it is hoped, will make them supply the place of deodar.

2591. Deodar is, in fact, far too valuable and expensive a wood for the purpose of sleepers, is it not?—Far too valuable.

2592. It is too valuable with reference to the other uses to which it is applied in India, for building purposes?—It is the best wood for building purposes in the Hill States, and the supply is not sufficient for the continual drain for railway wants.

2593. Has the iron wood of the Eastern Provinces, Arracan for instance, been tried for sleepers?—It has been imported to Calcutta from Arracan and the Andaman Islands of late years.

2594. But in practice do they find that the iron wood will retain the fastenings of the chairs, or that the action of the climate makes it worthless for that purpose?—It is only within the last two or three years that I have heard of its being used, and therefore I cannot answer that question.

2595. In the southern parts of India, with which you are more particularly acquainted, what wood is used for railway sleepers particularly?—If the teak wood was in sufficient abundance nothing else would be used; but six or eight other varieties have been used, to which allusion has been made already, that is to say, six or eight of the better species have been used in addition to teak wood in the Madras Presidency.

2596. And all are now habitually submitted to a process of impregnation?—The crossotising process, and the impregnating with mineral solution is used in some places.

2597. Is that found a sufficient protection against the white ants?—I believe the railway authorities would not continue to use it if they had not found it so.

2598. Do you happen to know what is reckoned now as the ordinary life of a sleeper in an Indian railway?—It depends upon the species of timber; the deodar lasts about 12 years, I think.

2599. Sâl and teak?—Teak we hope will stand very much longer.

2600. And iron wood still longer?—Of iron wood I am not able to speak.

2601. Regarding that casuarina, would it be a suitable timber for railway purposes?—It has been tried; I am not sure that it has been found to answer.

2602. As regards its density?—It is very hard, and is durable under water; but how it behaves under ground I have no knowledge.

2603. Is it used for fuel as well as for building purposes?—The branches and smaller portions are used for fuel, and the straight stems for building purposes.

2604. Then is the problem as regards the supply of fuel to the Indian railways at present at all approaching solution or not; or, to put it in another way, is the drain upon the country for fuel for firewood as great now as it was some eight or 10 years ago, or is coal becoming more extensively used?—Coal, I believe, will be used as soon as the railways permit of its being brought to the points where it is required, unless the cost, owing to distance, is too great; at present the price of coal in remote places, I believe, is three times the amount of wood.

2605. *Chairman.* Will you explain that; do you mean, having regard to the fact of the relative weights of wood and coal? I understood, when in India, from the engineers that the cost of the coal, which in Madras is entirely sea-borne, was fully three times the cost of the fuel obtained on the spot, and consequently wood is almost entirely used on the Madras railways. There is a train which leaves Coimbatore and another from Chidlapah, every morning laden with wood for railway fuel.

2606. Do you know that wood has been systematically cultivated along the Madras Railway for the purpose of fuel?—I am aware that large tracts adjacent to the railway have been planted and inclosed for the future supply of fuel.

2607. Have not those come into use yet?—They are growing; they have existed for some years, but are not yet at the stage for supplying fuel.

2608. How long have they been in existence?—Within the last three or four years.

2609. *Mr. B. Denison.* In what condition are the railway companies towards the Government with regard to the supply of fuel; have they contractors to supply them, or have they direct engagements with the Government? The railway companies deal with contractors, and these contractors deal with the forest officers, and have permission to work certain tracts demarcated to them periodically.

2610. But the railway companies are thrown upon their own resources?—The railway companies are thrown upon their own resources.

2611. The Government do not directly supply them in any measure with firewood?—They do not undertake to do so.

2612. As regards the spice-bearing trees, up to what degree of latitude do you find that they gradually die away; that is to say, what is the most northern point of latitude beyond which you do not find spice-bearing trees?—Spice-bearing trees are essentially tropical, and could not be grown in extra tropical places. Malabar is the only district where I have myself found them luxuriant.

2613. Have you given the Committee any information regarding the revenue derived in Central India from the licenses to gather the shellac and the cochineal?—I could not give in detail the proceeds from shellac. It is a considerable amount in different parts of India. In Bengal and most of the provinces it is one of the items of minor forest produce.

2614. The ordinary way is to give over a certain tract of country to a contractor, with a license to gather it, is it not?—For a certain period of time, I believe.

2615. About the bael tree; have you any knowledge of that tree?—Yes; it is one of the orange tribe; a very valuable astringent.

2616. Is it cultivated in Southern India?—It is cultivated, but chiefly in gardens.

2617. And from its being so valuable for medicinal purposes, the timber is not thought of?—That is so.

2618. *Mr. Carr.* I think it has been stated that the chief object of the administration of the forests is to prevent fire, and to prevent waste in cutting wood?—To prevent waste and to maintain a regular and abundant supply of material for the mass of the people.

2619. Otherwise you cut as many trees as are wanted, I suppose?—Consistently with a well-devised working plan.

2620. Do you ever refuse to send trees to a market that is open for them?—If it would overtax the rate of production of the forest.

2621. Then, as a matter of fact, do you refuse to send trees to a market?—If it would not consist with the working plan; if it would tend to the exhaustion of the forest we should do so.

2622. Are there instances in which you have found it necessary to do that?—There are instances in which we have said, "This forest has been shut up for a time, and must remain so, unless under an order of the Government."

2623. And, in that case, how do you supply the demand for timber? The duty of the forest officer is to maintain the permanent supply, irrespective of pressure, if it would endanger the forest to take trees from it.

2624. I see the theory, but I rather want to know what the practice is; have you ever found it necessary to say, "We cannot supply wood at all to this market"?—We say sometimes, "You must go elsewhere;" we refer them to another district.

2625. And you have found it necessary to do so?—Not unfrequently.

2626. You make it more easy for them to do so, by making roads, do you not?—Yes, by making roads and establishing depôts where it is convenient.

2627. So that, in general, you can supply the demand from one place or another, can you?—In general. We have established depôts at the mouths of the rivers, near railway stations, and other places, to meet the public demand.

2628. Then you have found it possible, from the forest, to supply the demand that has been created?—Yes.

2629. That is one of your duties; you also plant for future generations?—We also plant for future generations.

2630. For how many years do you consider that that last operation will be unremunerative?—The only plantation which has yet been established long enough to give data is the teak plantation of Malabar. The fuel plantations are comparatively young. The Malabar teak plantation, after 12 years, began annually to recoup and to repay itself by an excess of revenue.

2631. In how many years did it actually pay for itself?—It is now regularly yielding an increasing excess of revenue over expenditure.

2632. And how many years is it since it was planted?—It was commenced in 1844, and the receipts have now considerably exceeded the expenses.

Mr. H.
Cleghorn,
M.D.

expenses. The complete figures are easily given.

2633. Has it not been considered by some, that natural reproduction is a better way of increasing the forests?—Certainly, natural reproduction is most important, but it is necessary that planting should go along with it, because the planting ought to be in convenient spots, on the banks of navigable rivers, and on the sides of the railways, whereas natural reproduction can only take place in the places which nature has indicated.

2634. Do you generally plant what has already grown in the forest?—That will depend on circumstances.

2635. What I rather wanted to know was, how far you want a scientific botanist, rather than an ordinary forest keeper, to superintend those forests?—The resources of those large forests, of which we are speaking, are so varied, and so many of the products are as yet so little known, that obviously the more botany the forest officer has the better. He must possess many other qualifications.

2636. But in an ordinary case, putting aside the experiments upon foreign productions which we have heard of, would not a native who knew the forest and the use of different sorts of wood, be a man who would have sufficient knowledge to know what ought to be planted or what ought to be preserved?—We have now a certain number of native employes, and as soon as the forests are in a state of high production, and we have skilled officers capable of teaching, we can have a larger proportion of natives. At present, in Madras, we have 12 natives out of 48 in the department.

2637. Ordinarily you would say that for the preservation and maintenance of a forest great scientific skill would be thrown away, would you not?—Scientific skill is more needful in the higher officers, who have to correspond with various departments, and to ascertain the value of many new products which may be brought prominently before them.

2638. That is the work, is it not, rather of the superintendent of a botanic garden than the superintendent of large forests?—It is true that the heads of the department require much the same knowledge as the superintendents of botanical gardens.

2639. And that you consider at present is necessary in India, in consequence of the experiments that are being tried?—It is certainly necessary that they should possess a high amount of arboricultural skill and botanical knowledge.

2640. Mr. Grant Duff.] We have been examining you at greater length than either the receipt from, or the expenditure on, our forests at present would seem to justify, but I suppose I am right in thinking that these forests, of which we have undertaken the management, are a very large concern indeed, are they not?—Very large indeed.

2641. Should I be overstating their extent if I were to say that the forests of India which are now, or are coming, under the management of the Forest Department, are as extensive as the whole of the British isles?—They certainly cover an area greater than the British isles.

2642. And I think I have understood that we have at present about 88 European employes?—As near as I know at this moment, there are 86 to 88 European employes.

2643. And I suppose each of these European employes has under his management a district about as large as the county of Perth?—In many cases larger.

2644. But that is the smallest?—I think I may say that that is the smallest.

2645. It results from your evidence that the main object of our Forest Department is not the acquisition of revenue?—The main object is not the acquisition of revenue.

2646. Then I suppose you would say that if climatic considerations alone were in view, the amount of trouble and of expense which has been laid out upon the Forest Department up to this time would have been well spent?—That is my opinion.

2647. But, of course, the Indian Government is anxious, I presume, to make as good a thing as it can incidentally out of its Forest Department?—It is certainly the duty of the Forest Department to realise the largest possible amount of revenue, consistent with preserving the forests and working out a well-devised system of conservancy.

2648. And you believe that our revenue from it will gradually and greatly increase?—I am confident that it will do so.

2649. You have given some reasons for that opinion in answers to various honourable Members, the honourable Member for Portsmouth, and others; but I think from conversations with you that you could state some other reasons. You suppose, for instance, do you not, that the revenue from a great number of small articles which has at present been very imperfectly attended to, will eventually be very large?—I do. I believe that the gross receipts will continue to improve for four reasons. First, for the last eight years, with one exception (an official year of only 11 months), there has been a steady and progressive increase of the gross receipts. Secondly, the preliminary outlay which was needful in taking charge of the neglected and mismanaged forests was necessarily great at first, and will not occur again. Thirdly, I believe that increased experience will lead to greater economy of management and saving of material in various ways; and, fourthly, that many of those articles of minor forest produce which have been alluded to in the course of the examination will collectively amount to a large sum.

2650. Have you gone through all the more important ones?—We have mentioned in the course of the examination most of the medical and economic resources in gradual course of development.

2651. Are there any more products the sale of which would add to the revenue?—I think the principal minor forest products have been alluded to, gums, oils, resins, dyes, gall-nuts, and the like.

2652. Turning from the direct advantage which we may expect to our exchequer from the Forest Department, do you think that it has hitherto increased and is increasing the general wealth of the country so as to make it more capable of paying the necessary expense of a civilised system of administration?—I think that the progress of forest management has had important bearings upon the prosperity of the country; upon its extended culture and in other ways.

2653. Now, for instance, has it any bearing upon the habitations of the people?—I have no hesitation in saying that in certain districts the dwellings

dwelling of the natives are constructed of better materials, I might allude more especially to the Mahratta country; the rich cotton ryots use seasoned timber, and have better door-posts and better constructed dwellings than they had a few years ago.

2654. Your meaning, I presume is that since the more careful management by the Government of the timber, they can get seasoned wood, when before they would have had to put up with worse wood?—Clearly, inland depôts have rendered it available for that purpose.

2655. Has it had any bearing upon the communications of the country; has it been very useful to the railroads for instance?—I have already alluded to the very grave duties which have fallen on forest officers connected with the supply of sleepers and of fuel to the railways. I myself had to indicate the sources of the supply of 50,000 tons of fuel annually to the Delhi railway some years ago, and now the demand is increasing since more trains are running.

2656. In short, without the Forest Department I presume the railways would have been constructed at much greater expense?—I think the Forest Department has aided and expedited the formation of the railways and diminished the expense.

2657. Could you mention any advantages and especially any savings of expense, that have accrued to other departments from the operation of the Forest Department?—In the course of my duty I have corresponded largely with other departments, and have often been required to indicate the nearest points where various articles should be obtained; for instance, telegraph poles, handles of tools, and other necessary articles for the Ordnance Department, and gun carriages. To the Medical Department we occasionally supply gamboge, kino, sarsaparilla, and other articles of minor forest produce; to the School of Arts we have supplied box-wood and satin wood for wood engraving and for picture frames; and we have supplied other departments that I do not at this moment call to remembrance. In lieu of lance shafts, which were formerly made of ash from England, we have supplied a light form of bamboo, alluded to by one of the Members of the Committee, and in other ways we have met the wants of the different departments. I have mentioned all that occur to me at the moment.

2658. You have mentioned a great many useful products from which we may expect to derive revenue; but in such vast territories as those with which the Forest Department deals, considering that the botany of India is still imperfectly explored, especially in its economic aspects, there are probably a great many products as yet unknown, which will be commercially important?—I fully believe that there are economical and medical resources, little known, in course of gradual and progressive development.

2659. Much has still to be done, has there not, in examining the economic character of the plants of India?—Most certainly.

2660. And with a view to develop these and all other resources as yet unknown, we are trying to get as scientific a class of men as possible into the forest service, are we not?—That has been the order of the successive Secretaries of State in concert with the Governor General for some years.

2661. Is it within your knowledge that both the Government of India and the Secretary of

State in Council have taken a great deal of pains in this matter?—Yes; they are extremely anxious to have more skilled officers.

2662. *Chairman.* Do you mean people with more skill or a greater number of persons?—There are at present but a few skilled officers in the department; we want to increase the number.

2663. I thought you said that there were 80?—Yes, but they are not all skilled officers.

2664. *Mr. Grant Duff.* You have yourself made a great study of the forest systems prevailing on the continent of Europe, have you not?—When returning from India, I visited the forest schools in Italy, France, and Germany, and I am satisfied that there is very much to be learnt which would be highly valuable in administering the forests of our Indian Empire.

2665. And you think that so far as we have gone hitherto, we have gone on the right road?—I believe that up to this time the experiment has proceeded cautiously and judiciously, and that the fruits will appear.

2666. Do you know, of your own knowledge, that we are very anxious to get more native employes into the service?—I believe there has been a notification from the Governor General of India, declaring that, as soon as they are qualified to undertake the duties, there will be a larger number appointed.

2667. But I suppose I am right in thinking that although very little attention has been given to forestry as a science in England, it now is recognised as a science by itself?—There is a very large forest literature in continental countries. We in this island have paid comparatively little attention to forests. There are schools of great importance abroad, and the department is looked upon as a highly skilled one, and there is a desire to enter the Forest Department in Germany and France as there is to enter the engineers or artillery in this country.

2668. In all the other highly civilised countries of Europe forest management is made a great service, is it not?—It has taken a high place in the services of those countries.

2669. And in general forest management takes rank with the other great services of the state?—Yes.

2670. Anxious as we are to get native employes into our service, we could not get them in high posts to any advantage, could we, until we have got a real forest school in India, and good traditions of management?—It is contemplated, I understand, by the Governor General, and it is in consonance with his wishes that a native school should be eventually formed in Upper India, with a view of training natives to occupy these higher positions.

2671. But to attempt to do anything in that direction at present would be premature, except in the lower posts which they now occupy?—Yes.

2672. You mentioned various new trees that we are introducing in India; are we following the example that has been set a good deal round the basin of the Mediterranean, of introducing the *Eucalyptus* in districts which have been too much denuded of trees?—Within the last few years we have introduced several species of *Eucalyptus*, and several species of *Acacia* and *Casuarina*.

2673. We are introducing the *Eucalyptus* largely?—Yes, it is a remarkably quick grower; useful

useful for house building, and likely to become valuable on the Neilgherry Hills and elsewhere.

2674. And it is likely to restore to cultivation districts at present uncultivable?—Yes, some of the impoverished (*sholas*) glades on the Neilgherry Hills, and in other parts of India.

2675. So that indirectly as well as directly, we may look for considerable financial results from introducing those trees?—Yes; there are other trees, as the cork oak and chestnut of Spain and sumach, which are at present in process of acclimatisation.

2676. There were some misconceptions, I think, left on the mind of the Committee the other day with regard to Mr. Phillimore's duties; would you define what are your duties and what are Mr. Phillimore's, so as to leave a clear impression on the mind of the Committee?—With regard to my own individual duties, since my retirement from the service, two years ago, I have resided in Scotland, and have been the occasional referee of the India authorities on matters connected with arboriculture and the forestry of India. I was assistant secretary of the Hyde Park Exhibition of 1851, and have paid much attention to the timbers of India.

2677. You are referred to, I understand, where personal knowledge of the country, or scientific knowledge is required in dealing with the forest despatches?—Yes.

2678. And Mr. Phillimore's duties are merely to conduct the correspondence?—He conducts the correspondence as assistant secretary of the Revenue department, which includes forest matters.

2679. He is in no sense the manager or superintendent of the action of the Indian Forests Department?—He conducts simply the secretarial part of the department.

2680. Could you get for us, and put in, a list of the European servants of the Forests Department with their salaries, especially explaining who are scientific officers, and who are not?—Yes. (*The Witness furnished the Paper, vide Appendix.*)

2681. *Chairman.*] Can you tell me whether the Forests Department has discovered any wood in India that is suitable for railway sleepers beyond teak, which they can hardly be said to have discovered?—They did not discover the value of teak wood; they have discovered certain places where it was not known before, and have brought it to the market. I cannot say that they have discovered any wood that is adapted entirely for sleepers, but they have brought many woods to the notice of the railway companies.

2682. But not one of them has been found perfectly satisfactory, has it, so as to suit without artificial preservation?—Many of the softer woods are at present submitted to the impregnation of mineral solutions, and we have brought some to notice as being abundant, and therefore available for railway purposes.

2683. Do you know whether the acacia is suitable for railway purposes?—The *Acacia Arabica* (babool) in Scinde is found to answer very well for railway purposes, I believe.

2684. It will not decay, I suppose, by exposure to sun and rain?—It is in great demand for railway purposes.

2685. Is there much growth of that?—Yes, and it is being extended in Scinde and the Punjab.

2686. Has any consideration been given to its artificial cultivation?—In Scinde and the Punjab, certainly.

2687. Not elsewhere?—I am not aware. It grows better in those provinces than elsewhere.

2688. Is not that the only other wood, except teak, that offers a prospect of providing tolerable railway sleepers?—Sál and deodar.

2689. But you have stated that that only lasts 12 years?—They are extremely anxious to get wood that will last 12 years.

2690. The other woods will not even last for that length of time?—That I can scarcely answer.

2691. Can you tell me whether the Forests Department has ever made an economic estimate of the cultivation of any given quantity of land with teak, or any other wood?—I think the figures of the planting, both in Malabar and in Burmah, are very complete, and easily obtainable.

2692. Have they been carefully recorded from the beginning?—In Malabar, they have.

2693. Could you give the Committee a statement affording a proper economic estimate of the cultivation of an acre of land with teak wood in Malabar, showing the out-turn and the cost from the commencement, including the estimated out-turn from the thinnings?—I think I can give the total receipts and expenditure of the Conolly plantation in Malabar.

2694. And has that been done for the purpose of forming an opinion of the cultivation of any other wood in India?—We have not the data for the sales of more recent plantations; we have for the teak.

2695. But have any means been taken to form a record of facts, or otherwise, so that any economic estimate could be made of the cultivation of any other wood except teak?—The exact expenditure on the plantations is reported half-yearly, but the fuel plantations for the railways are as yet young, and the fuel is as yet small.

2696. If any one in this country were going to cultivate an acre with wood, he could have an economic estimate, without a Forests Department, or without any scientific aspirations of a high character; he could get an economic estimate made of the out-turn of that from the day it commenced till the whole of the trees were cut down; can that be given for these forests in India?—As the cultivation of timber is quite of a recent date, there are no antecedent data on which to base an estimate for a series of years, with the exception of the Malabar plantation.

2697. Then are we to infer from that that no economic estimates have been made of the result of the operations of the Forest Department?—Estimates as to cost and probable returns are invariably made before plantations are sanctioned, but the actual results of those plantations have not yet come in, with the exception of the Malabar one.

2698. Could you explain to the Committee how far the Government are proceeding in the treatment of forests with any practical economic views; at present you have told us that they have created a larger establishment and materially reduced the net results of their management, but what I am anxious for you to explain is, whether there is any definite view that you can bring before the Committee of an economic administration of a single forest in India, or a system

system generally so as to produce net results more satisfactory than those which we have heard of at present?—There is a Budget estimate submitted by every range officer, which is critically examined by the Inspector General, and it is only in consequence of the abnormal state of things, the heavy expenditure for the extension of railways and other purposes, that the expenditure has risen within the last one or two years, and, as I said before, we have no reason to believe that that will recur.

2699. But still you could not put before the Committee anything like a practical statement of the working of this forest system that would show any definite results?—I think the Budget estimate of the Inspector General of Forests would supply the information required.

2700. Mr. *Forrest*.] You alluded last time to the forests in Travancore, and you said that the accounts relating to them were at the India Office: have you happened to look into that, so as to give us an estimate of the revenue and the expenditure on those forests compared with our own? The Rajah of Travancore has a European conservator: he does not publish a detailed administration report, and does not submit it to the India Office; I have never seen the details; I am personally acquainted with the conservator, and have consulted with him, but these forests are the property of the rajah.

2701. But in talking to him has he ever given you any idea of what the revenue is compared with the expenditure in these forests in Travancore; has he ever told you that he has managed to hand over a large net revenue to the rajah?—I could not undertake to give the figure: there is no railway there, and the circumstances are very different; the trees are merely dragged off out by elephants to the sea-board.

2702. In reply to the honourable Member for Elgin you stated that during the last eight years there has been a steady and gradual increase in the gross receipts of the Forest Department?—Yes.

2703. Would it not be also necessary to supplement that statement by saying that during the same eight years there has been a steady and gradual decrease in the net receipts?—I mentioned the reason for that.

2704. But still as a fact, I mean without the reasons, that is the case is it not?—There was a diminution last year from the enlargement of the establishment required for special purposes.

2705. But is it not a fact (I will ask the reasons, if necessary afterwards) as a matter of accounts, that whilst this steady and gradual increase in the gross receipts has been going on, there has been at the same time a steady and gradual decrease in the net receipts?—It is so at present, certainly.

2706. You alluded a moment ago to the great increase in the expense of management in consequence of the railways, but I suppose if the Government are making a railway they pay for the sleepers which they buy from the Forest Department, do they not?—They pay for the sleepers.

2707. And that is put down as a revenue receipt, is it not?—It is. The labour market is much deranged by the enormous operations suddenly thrown upon the Forest Department, in connection with the progress of the railways, and it is not easy to calculate the exact cost of the timber.

0.59.

2708. But still with regard to the answer you gave just now, mentioning the carrying out of railways as one great cause of the increased expenditure, would it not produce the wrong impression that you give materials to the railways for nothing, whereas in fact you sell them to the railways?—We sell them.

2709. And that is put down as a receipt?—Yes.

2710. I really understand the very important duties which you perform, both in England and in India; in India you had the personal superintendence of the forests, and here you are the scientific adviser of the India Office. But I should be very glad if you could throw some light on what good the Forest Revenue Department in the India Office does?—There is no such thing as a Forest Department in the India Office.

2711. Will you state precisely what Mr. Phillimore does?—Mr. Phillimore, I thought, had corrected the misapprehension by explaining that the forest business was only one branch of the Revenue Department, and one which happens to have fallen more particularly into his hands.

2712. Then I am correct in understanding that there is a certain branch of the Revenue Department at the India Office in which Mr. Phillimore and other gentlemen are specially engaged, and therefore there is a department in the India Office which specially concerns itself with the forest revenue?—A branch of a department.

2713. Mr. *Grant Duff*.] Mr. Phillimore is an assistant in the Revenue Department, which a great many duties to fulfil, and one of the many duties which he has to fulfil, is attending to such correspondence (and it is not very far off, as comes from India, relating to forests).—Yes.

2714. Mr. *Forrest*.] Of course, for the scientific part, you have been very much interested in considering the revenue which has been derived from the forests?—Certainly.

2715. And supposing you had to take that revenue to see whether it was obtained from proper sources, whether too much or too little was obtained from the sale of timber or from the sale of wood for fuel, should you not feel it necessary, in order to exercise a control over that revenue, that you should know the items of which it was composed?—The minute details of the forest produce are not submitted to the India Office, they are critically examined in Calcutta, and the nine items of the forest revenue, furnished are alone entered in the Budget; the details are not sent home.

2716. But in regard to those nine items, you would think it very important that a person who has to audit the revenue should be intimately acquainted with those nine items, would you not?—The Inspector General in India reports especially on the Budget of the Forest Department.

2717. If he does that, in what way is the India Office concerned in the revenue; if they do not superintend it, why is it called the Revenue Department, or a branch of the Revenue Department?—I am not able to account for the distribution of work in the India Office; forests were at one time connected with the Marine Department.

2718. You consider, with regard to the persons who have to be employed in this Forest Department, it is very important that they should possess the highest scientific knowledge?—In the Administrative Department.

R 4

2719. That

Mr. H.
Cleghorn,
M.P.
—
28 April
1871.

2719. That they should be not only skilled botanists, but also that a knowledge of geology would be useful to them?—Highly valuable.

2720. And they are concerned, are they not, in the making of roads, so far as relates to the forests?—They should understand surveying.

2721. And engineering?—Levelling and road-making, certainly.

2722. Have you found any difficulty in obtaining this highly skilled European labour in England and Europe?—At the competitive examinations a large number of candidates come forward.

2723. And you would describe generally those whom you have obtained in the scientific department as persons highly qualified?—As highly qualified, with the additional training which they receive after examination.

2724. You have not thought it ever necessary to establish a special school in England for this department?—I have often considered that it would be highly advantageous to graft forest training upon such a school as the Royal Agricultural College at Cirencester, or the Highland Society of Scotland.

2725. To make it more a general branch of education in England, rather than to make it a special Government school; to graft it on any existing institution rather than to establish a separate school?—Yes.

2726. Mr. *Grant Duff*.] I suppose that the reason why we have not established or attempted to establish a forest school in this country is twofold; in the first place, because our forest service is an extremely small one; and, in the second place, because we can get admirable training on the Continent, far better than we could provide in this country?—Yes, and there are extensive forests there, which there are not in this island.

2727. So that the question of establishing a Forest College must be decided on different grounds from the question to which the honourable Member refers, the question, viz., of the Civil Engineering Colleges?—Certainly.

2728. Mr. *Lyttelton*.] Are you aware how long ago the Conolly plantation was planted?—It was commenced in 1844.

2729. Is there any special record of that?—There is of its earlier history, and it has been periodically noticed in the administration reports.

2730. It is perfectly well known, I suppose, what the planting cost, and what has been received since?—The figures have been kept in complete detail.

2731. Is there any estimate of the future

receipts since that date to the end of the 80 years?—Estimates have been submitted of the probable receipts of that plantation, and are included in the administration reports.

2732. And that includes the total amount that will be received, at the end of 80 years, when the whole of the timber has become matured?—Yes, that is entered in full detail in the administration reports of the last few years.

2733. *Chairman*.] The receipts from the thinnings of the teak plantations are very valuable, are they not?—They more than pay expenses; every year there is an excess.

2734. Mr. *Lyttelton*.] Those returns to which you have alluded, would show the receipts from the loppings, I suppose?—Yes.

2735. And those would guide us as to other plantations?—To the whole in Malabar.

2736. And as to those forests that now exist?—With regard to those in a natural state, it is difficult to furnish an estimate per acre of a forest that has been neglected. In the case of a plantation, we know exactly, and can speak with confidence.

2737. Can you say roughly what would be the value per acre of a plantation at the end of 80 years?—I can only state, that 7,000 rupees, or 700*l.*, are spent annually on the Conolly plantations; 300*l.* of which are for planting 100 acres added every year.

2738. *Chairman*.] The question is what would be the value of the teak standing on an acre of ground at the end of 80 years?—That is a question of estimate, as to which many things might prevent my coming to a correct figure.

2739. Still there would be an approximate estimate for a successful plantation?—Up to the present date it has been eminently successful, and the annual gross receipts have been increasing year by year.

2740. It must be known how many trees would stand on an acre?—We have that as an estimate; we have not yet any teak plantations of anything like complete maturity.

2741. It must be known what is the girth of an 80 years' tree?—Yes, but it differs enormously in different localities.

2742. Taking the character of the soil as good, bad, or indifferent, it is known what is the growth of a tree of 80 years, is it not?—Yes, the estimate which is presented in the administration reports includes the prospective value for 80 years.

2743. You will furnish that to the Committee?—Yes.—(*The Witness furnished the Statement and Report, vide Appendix.*)

Mr THOMAS LAWRENCE SECCOMBE, C.B., called in; and Examined.

Mr.
Seccombe,
C.B.
—

2744. *Chairman*.] WILL you have the goodness to state what office you hold in the India Board?—I am Financial Secretary.

2745. Have you been in that department from the commencement of your public career?—I entered the service of the East India Company in 1829. I was appointed Assistant Financial Secretary in the India Office in 1858, and Financial Secretary in 1859.

2746. I wish to direct your attention to the items of the Accounts of 1869–70; will you be good enough to direct your attention to the item in those Accounts of 1,110,224 *l.* of revenue de-

rived from “assessed taxes,” and to state to the Committee what are the taxes that are intended to be described as assessed taxes?—The principal tax, which is included therein, is the income-tax. There are small receipts of arrears from license-tax, and from the tax on trades and professions of previous years included in that sum, and some minor receipts which are only described in the accounts as receipts from military and public works; I believe it to be chiefly the income-tax.

2747. Will you state what has been the course of the Government of India in levying this tax; when

when did it first begin?—It was a measure introduced by Mr. Wilson towards meeting the serious deficit after the mutiny. It was then a tax of 4 per cent. That tax was imposed in 1860, for five years; it expired in 1865, and there was an interval without any assessed tax.

2748. Before this tax was levied, were there any taxes levied in India of the nature of a tax upon incomes or profits, or otherwise?—Immediately after the mutiny the Lieutenant Governor of the Punjab requested sanction from the Government of India to impose a trade tax. He obtained that permission, and it was afterwards given to the Chief Commissioner in Oude. For two years small sums, amounting in the first year to somewhat above 100,000 *l.*, and in the next year to a rather larger amount, were received. On the introduction of the income-tax by Mr. Wilson the trade taxes ceased for the most part.

2749. But were there any other taxes of that nature levied upon the trades or industry of people, or otherwise in other parts of India?—There was the Moturpha tax at Madras.

2750. Was that levied for the purposes of the local government?—No, it entered into the Imperial taxation.

2751. Do you recollect the amount of that?—It was small. I cannot state the precise amount.

2752. Was that a tax levied over all trades and occupations in towns and villages?—In towns. I am not sure as to villages, but I believe it was also levied in them.

2753. Was there any similar tax levied in any other presidency?—Not for Imperial purposes.

2754. Was there by the local government?—Of that I am not fully informed. It has often been noticed by the financial member of the Governor General's Council that we have no sufficient particulars of the local taxation.

2755. But was not the Moturpha tax more extensively levied than in Madras; was it not one of the primitive taxes in India; were not trades and occupations taxed under it?—It was an ancient tax, certainly. I believe that trade taxes for local purposes had been long established in India.

2756. In 1860 what was the nature of the tax imposed?—It was a tax of 3 per cent., a general income tax on the basis of the English tax, with an additional 1 per cent. to be appropriated to public works.

2757. On what incomes was it to be levied?—The minimum income was 200 rupees per annum. Incomes of 200 rupees to 500 rupees were subject only to a reduced tax of 2 per cent. On incomes of 500 rupees and upwards the tax was 4 per cent.

2758. That is 3 per cent., with the 1 per cent. for local purposes?—Yes.

2759. Did the 2 per cent. in the lower scale include the 1 per cent., or was it 2 per cent. instead of 3 per cent.?—It was 2 per cent., without the additional 1 per cent.; the 1 per cent. was not levied on those incomes.

2760. Did that tax apply to every class of income derived in India?—Yes.

2761. And to every class of landowners?—Yes.

2762. To the Bengal landowners as well?—Yes.

2763. Was any change made in the mode of levying the tax in 1862?—Yes, in 1862 a change was made in the mode of levying it, the separate account of the 1 per cent. for public

0.59.

works being discontinued, it having been found to be inoperative.

2764. Was the minimum of income liable to taxation raised by the Act of 1862?—Yes, it was raised to 500 rupees.

2765. Was any further change made in 1863?—In 1863 the tax was reduced from 4 to 3 per cent. upon all incomes.

2766. Was the law for levying that tax a very comprehensive law, following very much the English Income Tax Act?—It was.

2767. And containing an immense number of minute provisions?—It did.

2768. When did that tax expire?—In 1865.

2769. What was afterwards done to raise a revenue by assessed taxes?—Nothing until 1867, when a license tax was imposed.

2770. What is the nature of that tax?—It was a tax on professions and trades, the minimum license being 4 rupees, and the maximum 500 rupees, according to a scale which was given in the Act.

2771. Will you state shortly what that scale was?—On profits from trades of 200 rupees, and less than 500, it was 4 rupees; 500 rupees, and less than 1,000, it was 10 rupees; 1,000, and less than 5,000, it was 20 rupees; 5,000 rupees to 10,000, it was 100 rupees; 10,000 to less than 25,000, it was 200 rupees. Incomes of 25,000 rupees and upwards had a maximum assessment of 500 rupees.

2772. Were persons in the public service liable to pay this tax though they would, of course, take out no license?—They took out no license, but they were subject to the tax.

2773. Was the exemption for them the same as for other people, as regards scale?—Yes, the same. There were some peculiar exemptions for military officers of a certain rank.

2774. What were the exemptions made in their favour?—Military officers not in civil employ, whose pay and allowances did not exceed 6,000 rupees per annum, and Government employes with a salary of less than 1,000 rupees a year, were exempt. Cultivators of land, not keeping a shop for the sale of produce, were also exempt.

2775. And were the owners of land exempted also?—They were exempt. It was not a property tax, but a license tax upon trades and professions.

2776. Was there any definition of what constituted carrying on a trade or profession?—“Every person exercising any profession or trade,” was the definition.

2777. What was done after the Act of 1867 was passed?—In the following year that Act was repealed by what has been termed the certificate tax, which was much wider in its extent. The minimum of that tax was on incomes of 500 rupees, but the highest amount charged was on four lacs of rupees a year, and then the certificate amounted to 6,400 rupees; it was a tax beginning with eight rupees for 500 rupees, and going up by a gradual scale.

2778. Were there any exemptions in that Act?—The exemptions were nearly the same, in fact precisely, I think, as in the license tax.

2779. Was that for one year?—That was for one year.

2780. What was done in the following year, 1869?—In the following year an income tax was again introduced, but of only one per cent.

2781. Was it upon all kinds of income?—On income

Mr.

1871.

income arising from offices, property, professions, and trades.

2782. Did it apply to incomes derived from the land both by landlord and tenant?—Yes.

2783. What was the limit of that tax?—There was no limit to that tax. There was a classification for the lower rates of income; but it was a one per cent. income tax.

2784. But what incomes were exempt from that tax?—Only those under 500 rupees.

2785. Was there any exemption in that Act in favour of the public servants or the military?—There was the same exemption in regard to military officers, and the tax was not imposed in regard to property set aside for religious and charitable purposes.

2786. That exemption for religious and charitable objects extended, I think, throughout the Acts, did it not?—Yes.

2787. What Act was passed after that?—In the autumn of that year a further Act was passed, the effect of which was to increase the assessment by a half per cent. for the whole year. It was one of the measures adopted by Lord Mayo on its appearing that there was a serious deficiency in the estimated income.

2788. What was done then in the following year 1870?—In 1870 the income tax of six pies in the rupee, that is equivalent to three and one-eighth per cent., was imposed.

2789. Was that in all other respects on the basis of the former Acts?—Yes, on the basis of the former Acts; it was imposed for only one year.

2790. Can you explain why the last Income tax Act differs so entirely in its frame and character from the first Income tax Act; is it not extremely short?—Yes; the question of an income tax had been much discussed, and as the amount was heavy, it was obviously the desire and intention of the Government to remedy any defects that it could possibly be believed existed in the former Acts.

2791. On what principle was it that all the provisions, or the greater part of the provisions of the first Income tax Act, were omitted from the last Income tax Act, that is, the Act which regulates the collection; the Act of 1868?—In the first Income tax Act every person was required, as in this country, to render a statement of his income; in the more recent Act that provision was omitted, and they were not required, in regard to the lower classes of income, to make such a return, unless required by the collector to do so. He, as far as I understand it, sends a statement of the sum which the individual was to pay; and unless he appealed against it, that amount was assessed upon him.

2792. Could you state to the Committee shortly what the change was that enabled the Legislature to pass such a very short Income tax Act, in its clauses, in the year 1868?—I believe that the form of the first Income tax Act was adopted in order that no one should escape from assessment. I believe that the more recent Act was passed with a desire to avoid any chance of oppression on the part of the lower officials who had the administration of that Act.

2793. But is the great brevity of the last Act arrived at by transferring to the Governor General in Council, in his executive capacity, the whole power to collect the tax, instead of defining the powers and duties of the collecting officers in the Act itself?—The duties of the collectors

were shortly stated; but I am not aware that there is any omission of any point of importance.

2794. Were these taxes collected always within the year, or did the collection of each tax extend from one financial year into another?—They were collected, as far as possible, within the year.

2795. Would the revenue account represent the actual collection of each of the several taxes within the year, or would the amount of arrears render it impracticable to ascertain from the revenue account what was the result of each tax?—The precise result of each tax would not be shown, because the amount brought to account in each year was the amount collected.

2796. Can you tell the Committee what was the amount produced by each of these taxes?—No, I could not.

2797. No such accounts have been sent home?—No, we have not such accounts.

2798. Can you inform the Committee how far the item placed in these accounts for 1869-70, of 1,110,000*l.*, represents the tax which was levied under the Act of 1869?—There were two Acts in 1869, the one at 1 per cent., and the other to increase the amount passed in the autumn of that year.

2799. Do you suppose that the collection of that was so close that it would give us any idea of the out-turn of the two Acts of 1869?—There would be, no doubt, some arrear, and probably rather a considerable arrear, but in the main I should say that it might be taken as a near approximation to the amount.

2800. Are you in a position to tell the Committee, then, what is the out-turn of 1 per cent. of income tax under these Acts?—No; it has been stated at 700,000*l.* in round numbers, but we have no authentic statement as to the precise amount that would be obtained from a 1 per cent. income tax.

2801. Have you any statement showing the classified collection of this tax; the different amounts of income, and different classes of persons?—No, those have not been sent home.

2802. Do you know whether any such analysis has been made in India?—I have seen it stated that they have very accurate and voluminous statistics as to the tax in India, but they have not been sent home.

2803. Perhaps you would be able at some future time to furnish the Committee with some classified summary of the tax?—We can apply for those statistics.

2804. Mr. Dickinson.] Does the income tax absorb the Moturpha and those other taxes that you referred to?—Yes.

2805. The Moturpha is abolished, and the license and certificate taxes are abolished?—Yes.

2806. Might I ask what is the meaning of the "allowances, refunds, and drawbacks," 42,274*l.*?—They would be amounts allowed on appeal, after having been collected.

2807. Mr. Beach.] Has there been represented to you much feeling with regard to any of these taxes; the income tax particularly?—There was much discussion between the Government of Madras and the Government of India in regard to the first tax, but on the whole there certainly was little feeling exhibited on the part of the people, so far as I have been able to ascertain. There was one case in which the officers employed in Bengal in collecting the tax were considered

considered to have misconducted themselves, and to have exercised some oppression; they were severely censured, and that was the only instance in regard to that tax. More recently there has been no doubt a great amount of feeling, there have been several petitions and great complaints in the press, and in consequence the Secretary of State applied to the Government of India to ascertain whether the complaints of oppression were well founded; and the answer was that there had certainly been some instances, but they were not of a very serious or extensive nature.

2808. I suppose that part of the feeling was owing to the circumstance of its being a new tax; a tax to which they had not previously been used?—In regard to the first income tax, undoubtedly it was. But then the emergency was favourable to its imposition.

2809. It has recently been raised again?—It was raised, in 1870, to 6 pies in the rupee.

2810. That is very nearly what it was originally?—The tax of 1870 was at the rate of three and one-eighth per cent., that of 1860 of four per cent.

2811. Do you think that there is more feeling against it, where the permanent settlement has taken place, than in other places?—No, I have no reason to think that. The feeling, to a great extent, is on the part of the European community; it is not confined at all to the zemindars.

2812. And on the whole, from what you have been led to think, would you consider that a tolerably equitable mode of raising a portion of the revenue?—I think it is a proper mode of imposing taxation, if it be requisite to resort to additional taxation at all.

2813. And with respect to the license tax, does that seem to press heavily upon the trades and professions?—I think not; but that has ceased as an Imperial tax.

2814. It is used only for local purposes?—It is now open to the local governments to use it or not.

2815. Sir C. Wingfield.] This income tax, in India, was levied as a per-centage for many years; did you ever hear that any inconvenience was found in India from levying it as a per-centage; that it was found a simpler mode to levy it by so much a rupee?—I never found that there was any inconvenience; but there is manifestly greater simplicity in levying it at so many pies to the rupee.

2816. Mr. Dickinson.] Is the collection of income tax paid for by a per-centage?—The officers of the land revenue are the principal officers employed in the collection of the income tax.

2817. And there is no special per-centage?—There is a charge for subordinates, but whether that is in the shape of a per-centage I am not aware.

2818. Mr. M'Clure.] I see that the estimate is considerably larger for 1870 and 1871; is that altogether arising from the change?—It was from the increased rate imposed.

2819. Do you expect that it will progressively increase?—That increased rate of six pies in the rupee has already ceased. The Government of India are about to reimpose the tax at the rate of two pies in the rupee; in fact, the Act has been passed though we have not officially received it.

0.59.

2820. Do you think that the amount of income of the country will progressively increase?—Do you mean under all heads, or in regard to the income tax only?

2821. In regard to the income tax?—There can be no doubt, I apprehend, that the income of India will progress, and there will be a larger out-turn from any tax upon it.

2822. Mr. J. B. Smith.] I see here the abkari tax (that is the tax on spirits and drugs), and I see that there is a very large increase since 1865; does that arise from an increase of the duties?—The abkari tax does not come within my department; it is under the Revenue Department: mine is confined to finance, but I believe that generally the increased prosperity of the people has led to their using the articles upon which that tax is levied more freely.

2823. Then it has arisen from that prosperity rather than from any increase in the rate?—From that and from the additional area over which the abkari tax is now collected.

2824. Then as regards salt, there is a very considerable increase; has there been an increase in the duty on salt?—There has been an increase in the duty recently at Madras and Bombay from Rs. 1. 8. to Rs. 1. 13. per maund.

2825. Mr. Lyttelton.] Is it your opinion that by means of the income tax in India we reach classes who are otherwise inadequately taxed or not taxed at all?—That has been the great object of an income tax so far as I have seen.

2826. Then you approve of taxing classes that would otherwise escape taxation by means of the income tax?—In regard to professions and trades, and persons making large incomes in those capacities, it has been held, and I believe correctly, that they are not taxed so highly in proportion to their incomes as the bulk of the people of India, and therefore that there is no injustice in imposing an income tax upon them if that tax be not excessive.

2827. And is it from all those classes that a great outcry against the income tax has come, or only a few?—Memorials against the income tax have been signed by a large number of the European mercantile community, and also by natives.

2828. Is that joined in by cultivators or proprietors of the land to any great extent?—We have not such an analysis of the signatures to those memorials as will show that, but I believe not.

2829. Is it stated in the memorials that you have mentioned that the imposition of the income tax on permanently settled proprietors has been a breach of faith?—It has been so stated, but not in the memorials.

2830. The greatest amount of discontent, as a matter of fact, has come from Bengal, I believe?—I can hardly say that. A memorial, influentially signed, has also come from Madras, nearly in the same terms; in fact I believe word for word it was the same memorial sent for signature to Madras as that which came from Bengal.

2831. Do you know whether it has been held by any jurist or lawyer of eminence that permanently settled properties ought not to be taxed in this shape?—That question was very fully considered and debated at the time of the introduction of the first income tax, and it was then held, especially by Mr. Wilson in introducing the tax (and he appeared to me to establish it)

s 2

Mr.
Saccombe,

1871.

that

Mr.
Secombe,
C.B.
—
28 April
1871.

that it was no breach of faith to impose the tax on the permanently settled districts.

2832. Mr. *Eastwick*.] There was a memorial also from Bombay against it, was there not?—I think there has been one.

2833. Can you tell me whether in the first instance, when the tax was imposed, there was an immediate reference made to the Secretary of State, and did he approve of the tax when Mr. Wilson proposed it?—Yes, he did approve of it.

2834. And all along it has been approved of by the Secretary of State?—Yes.

2835. Mr. *Grant Duff*.] What was the reason of the change from the license tax to the certificate tax?—The license tax affected mainly the lower class of traders; the certificate tax affected in a proportionate degree those who were making larger incomes, and it was considered to be just to make that change.

2836. What was the reason of the change from the certificate tax to the income tax?—It was again thought that the certificate tax was an imperfect income tax, and that it would be better to make it an income tax in reality.

2837. In short, the income tax was re-imposed as being the fairest tax of the kind which the Government could find?—It was.

2838. And this policy was approved by successive Secretaries of State?—It has been.

2839. Could you explain in a few words what the attitude of the Secretary of State in Council was to the enhanced income tax of 3½th per cent.?—It was that of great regret that it should have been found necessary.

2840. But on the whole, I suppose, it was considered that Lord Mayo's Government had under very difficult circumstances done the best thing that it could?—It was.

2841. Under the very peculiar circumstances of the time?—Yes.

2842. Sir *C. Wingfield*.] Under the certificate tax I think no inquiries were made into incomes?—No.

2843. The people were ranged in grades?—They were.

2844. In regard to those taxes that were levied in the Punjab and in Oude in the year 1860, before the income tax, as passed by Mr. Wilson, was introduced, you are aware, I have no doubt, that there was no attempt to inquire into income in those, but that those taxes were fixed on what was called the lump assessment principle?—They were.

2845. We first of all decided what a district was to contribute, then it was spread over the villages, and then the people in the villages spread it over themselves?—Yes.

2846. But I daresay you are aware that the circumstances at the time that that system of taxation was introduced were very different from what they became subsequently, because the country had just recovered from the mutiny and insurrection, and the people looked upon this tax simply as a means resorted to by the Government to reimburse themselves the expenses of the mutiny?—I have seen it so stated, but we have no official information to that effect.

2847. In fact in Oude the name by which it went among the people was a fine for the rebellion; I put that to you because the fact of those taxes levied in that rough manner being submitted to so cheerfully, was really

owing to the very peculiar circumstances at the time of their introduction?—Yes.

2848. *Chairman*.] Are you aware that, in the Acts relating to the public funds in this country, there is a provision that the dividends from the public funds shall not be subject to any special tax?—I am not aware of that.

2849. It was considered that the income tax in India was not a special tax upon the zemindars, but a tax upon his income, the same as everybody else's income?—Yes.

2850. And, therefore, it was not any violation of the engagement entered into with him?—Quite so.

2851. Can you tell me whether any estimate has been made in India of the amount that a person enjoying any definite income would be liable to pay in taxes?—Officially we have no such estimate.

2852. You could not give us any information on that point?—No, not any trustworthy information.

2853. Will you direct your attention, if you please, to the item of 765,126*l.* as "tributes and contributions" from native states, and explain to the Committee from what sources that revenue is derived?—It is that which its title conveys, they are tributes and contributions, in accordance with treaties, received by the Government of India.

2854. Can you give, if you please, any more detailed explanation of the amounts?—For the most part they are permanent; a portion of them is paid for the maintenance of military forces; a portion of them, according to the terms of the engagements, is paid for British protection; and a portion in commutation of military service.

2855. Can you give the amounts paid under those different heads?—I have not the particulars separated for 1869-70; for 1867-68, when the amount was 689,286*l.*, as far as I could classify them, the charge for the maintenance of military forces was 281,000*l.*; for British protection 211,000*l.*; in commutation of military service 125,000*l.*, and payments by various petty states, in regard to which we have no very definite information, 71,000*l.*; the treaties could be furnished if required.

2856. With regard to the receipt of 281,000*l.*, is the Government of India under any engagement to provide a military force, involving a definite expenditure in those cases?—It does maintain, and it is under engagement to provide forces: the Bhopal contingent is one portion and the Mysore division is another. In regard to Cutch, the protection is that of the general military force of the Empire.

2857. Can you state what that expense is in regard to Mysore and Bhopal?—They are so blended with the general military expenditure that I am unable to say.

2858. With regard to the item "British protection," does that mean some special service or general protection?—It means protection in general terms.

2859. The question as to the commutation of military service, that is what parties pay instead of rendering such service, I presume?—Yes.

2860. Is there any probability of that item either increasing or diminishing from any circumstances?—I can see no probability of its increasing; if there be any change, there is more probability of a decrease, but I am not aware of any immediate probability of that.

2861. Sir

2861. Sir C. Wingfield.] Is not the Mysore contingent paid out of the revenues of the Mysore State?—The military expenditure for a local force of cavalry and infantry is, I believe, believe, paid out of the revenues of the Mysore State, but there is also a considerable regular force, the charge of which is defrayed from the tribute to which I have referred.

2862. You have not formed an opinion, have you, on this point, whether the native states of India contribute an adequate amount to the British Government for the protection which they receive from the British army?—There is a Political Department in the India Office, which has especial charge of those questions. They do not come within my department.

2863. Mr. Dickinson.] I suppose you cannot help us to the principle on which the Nuzzeranas are assessed?—That also is a question appertaining to the Political Department.

2864. Have you an exact list showing each contributor to the fund?—No, we have not a list. In order to obtain the information which I have given to the Committee, I had to take the treaties and engagements themselves, which are published in several volumes.

2865. Within the last two years there has been a slight increase in that respect?—It was merely in regard to payment, not in regard to amount payable, I apprehend; that which is brought to account is the amount received within the year, but I am not aware that there has been any important difference, such as would justify the belief that the account shows that which is payable.

2866. But the Nuzzeranas are a variable sum?—So far as they are on succession they would be clearly variable. Some of them, described as Nuzzeranas, appear to be of a continuous character.

2867. Mr. Beach.] Are these contributions provided for by special agreements?—Yes, by special agreements.

2868. Then they are not likely to be varied materially?—Not at all, unless by some Act of the Government.

2869. They are generally arranged satisfactorily, are they, from all you have heard?—As far as I am aware; but it does not come within my department.

2870. There are no complaints with regard to that point from the native states?—None.

Mr.
Secombe

THE RIGHT HONOURABLE ACTON SMEE AYRTON, IN THE CHAIR.

Sir CECIL BEADON, K.C.S.I., called in; and Examined.

Sir
C. Beadon,
K.C.S.I.
—
2 May 1871.

2871. *Chairman.*] WILL you kindly state what offices you held in India?—I was Secretary to the Board of Revenue, Secretary to the Government of Bengal, and afterwards Lieutenant Governor of Bengal.

2872. In your capacity of secretary of the Board of Revenue, I presume you became familiar with all the incidents of the duty on salt in the Bengal Provinces?—Yes.

2873. Did those functions extend also to the North Western Provinces in connection with salt?—No, only Bengal proper.

2874. You are aware that in 1856 an inquiry, was conducted by the Government of India into the manufacture, sale, and tax on salt throughout India?—Yes.

2875. And that included every province and part of India, I think?—I think it did.

2876. Will you be good enough to state what were the circumstances which led to that inquiry, if you happen to know them?—I think it was owing to Lord Dalhousie desiring to have before him a full and complete history of all that had been previously done in regard to the salt revenue.

2877. Will you state what was the mode in which the salt revenue was conducted at that time in Bengal?—The revenue was collected partly by a system of Government manufacture and sale, and partly by a duty on imported foreign salt.

2878. Was any arrangement at that time subsisting for the importation of salt into Bengal?—Yes.

2879. Will you state somewhat more in detail what was the system of manufacture under the Government?—The districts on the sea-board of the Bay of Bengal were divided into a certain number of agencies, and an agent was appointed to manage each district or agency. Advances were made to the inhabitants of those districts, and they entered into an agreement to manufacture and sell to the Government a certain quantity of salt at a certain rate. That manufacture was carried on under such supervision as was

necessary to prevent smuggling, and when the salt was manufactured it was stored in Government warehouses, and there it was kept until it was sold. The sales for the greater part of Bengal were always effected at the Board of Revenue in Calcutta. Merchants used to apply to the Board for the quantity of salt which they required; they paid the duty and the price, the price having been fixed by the Board at the cost of manufacture, and then they received from the Board an order upon a particular agency for the quantity of salt which they required.

2880. Was the sale always at a fixed rate in the whole, or was it an upset price?—The Board used to fix every year the price of each particular kind of salt by calculating what the cost of production was, and adding the duty to it, so that the salt was always sold to the public at the cost price, *plus* the duty.

2881. So that there was no competition whatever?—None.

2882. The Government fixed the price, and they took it if they chose at that rate?—Yes.

2883. Everybody was at liberty to buy at that rate?—Yes, in 1856. But there was also a supplementary system of sale for the districts in which salt was produced. It was found impossible to realise the same amount of duty from the salt which was sold in the saliferous tracts, as from the salt sold in those tracts where salt was not produced; and for that reason local stores were opened in these districts which were superintended by the local agents, and the merchants who desired to sell salt in those districts bought their salt at these local depôts at a price which was fixed from time to time by the Board with reference to the particular circumstances of each district.

2884. Were there any licences granted at that time to other persons to manufacture, on payment of a fixed duty, in Bengal?—Yes; there were a few instances; I think they were licences exclusively to Europeans who desired to manufacture salt on a more scientific method than the natives used.

2885. What

2885. What was at that time the duty on salt?—Three rupees four annas a maund. That comes, I may say at once, to 72 *d.* on 80 lbs., or a slight fraction under 1 *d.* a lb.

2886. Do you recollect what proportion that generally bore to the cost of manufacture?—It varied in different agencies.

2887. What was the general cost of the manufacturing of salt?—It varied from 80 to 110 rupees per 100 maunds.

2888. And was the license duty the same as that which you have mentioned?—Precisely, and so was the import duty.

2889. Was there any restriction upon imports, or was it perfectly open to everybody on paying that import duty?—It was perfectly open.

2890. Will you state the amount of the duty collected in Bengal in the year 1857-58, the quantity manufactured, and the quantity imported, and the amount collected as customs?—Taking Government salt, and first of all what is called "Wholesale under Presidency Rowanahs," that means the salt sold by the Board to the wholesale merchants, the quantity is 2,749,191 maunds; the prime cost of this salt to the Government was 1,514,716 rupees; the duty upon it was 6,872,977 rupees, and the total proceeds, that is to say, the total of those two last items was 8,387,000 rupees.

2891. Mr. Fawcett.] Is that Bengal alone?—It is not quite Bengal alone, because a certain quantity of that salt, when it is taken away by the merchants, is carried up the Ganges beyond the limits of the Lower Provinces, and is sold in the Province of Benares; but it is not a very large quantity.

2892. Chairman.] Having once paid the duty it passes free into the Upper Provinces, and any other provinces in India?—Yes, perfectly free.

2893. Therefore you have no account of the export of salt into the interior from the Province of Bengal?—None whatever. In addition to this quantity there was sold at the local depôts 916,000 maunds; the proceeds were 1,742,000 rupees, and the total proceeds of the Government sales were thus made up to 10,129,964 rupees. Then there was imported by sea 3,429,000 maunds, which paid a duty of 8,020,000 rupees; and there was manufactured under excise 18,263 maunds, which paid a duty of 45,657 rupees. Then there were miscellaneous receipts of the department charges, forfeitures, sales, and so forth, 123,000 rupees. So that the aggregate quantity of salt cleared and sold in 1857-58 was 7,113,000 maunds, and the total gross proceeds were 18,319,000 rupees. The charges of the department, including the cost price of salt, were 3,885,000 rupees, and the net revenue was 14,434,000 rupees.

2894. When you use the word "charges," do you mean that those were charges over and above the sums paid under the contracts for the manufacture of the salt?—No, it includes that.

2895. When was any change made consequent upon the Report of 1856 in Bengal in the administration of the salt revenue, or was there any change made in it?—Nothing was done upon that Report for a long time. It was not till 1863 that the Government determined to abandon altogether the system of manufacture.

2896. Was the rate of duty that you have described as that imposed on the manufactured salt, or intended to be collected from the manufactured salt obtained by the Government net, 0.59.

without any deduction, and were all the expenses connected with the manufacture and the collection of that amount considered as part of the cost of manufacture which you describe as influencing the price?—No, all general charges connected with the department were debited to the revenue as expenses of collection; it was only the actual charges of manufacture that were put upon the salt.

2897. That is, the sums you paid to the cultivators and the cost of paying them?—And the local agencies; everything connected with the expense of the local agencies was debited to the cost of salt; all general charges of the department were debited to revenue.

2898. Did I rightly understand you that there were different prices with reference to the quality of the salt manufactured in fixing the sum for which the salt was to be sold, or was it all treated as of one value?—No, it was all calculated upon the actual cost of manufacture without reference to quality at all.

2899. Was the salt thus manufactured very much inferior in quality to that which was imported, as regards the pure salt in it?—Well, examined chemically, it might be; but the people liked it just as well as the imported salt, and bought it as readily.

2900. Mr. J. B. Smith.] And did they buy it at the same price?—They paid more for it, because the importers could always afford to sell their salt at from 70 to 80 rupees a maund, when the Government were charging 100, and still the Government always had a sale for its salt.

2901. Chairman.] They preferred the sea salt made by the Government to that which was imported?—I suppose they were accustomed to it.

2902. You were going on to explain what change was made?—In 1863 the Government system of manufacture was abolished, and the Government from that time determined to depend for its revenue upon the duty to be derived from the importation of foreign salt, and from the excise duty upon salt manufactured in the country.

2903. Was that carried out in that year, or immediately?—It immediately began to be carried out.

2904. Then had that arrangement the effect of putting the salt revenue of Bengal on the same footing as that of all the rest of India; or do you happen to know whether there is any Government manufacture carried on still in India?—I believe that there is a manufacture carried on at Madras and at Bombay.

2905. Can you state what was the effect of that change on the production of salt in India, and on the amount of duty?—In regard to the production of salt in Bengal, you may say that it ceased absolutely; when the Government determined to give up the manufacture, the production of salt in Bengal ceased. I believe that there was no excise derived the first year, or if there was any, it was something extremely trifling; since that it has increased, but the main supply of salt for Bengal now comes from abroad.

2906. Was the rate of duty to be collected in Bengal continued the same as that which the Government had charged on their own manufacture?—Exactly the same.

2907. To what do you ascribe the cessation of the manufacture of salt in Bengal after the Government gave it up?—Because no person had

Sir
C. Beadon,
K.C.S.I.
2 May 1871.

Sir
C. Beadon, K.C.S.I. had sufficient capital to manufacture salt under the excise system, which the Government found it necessary to establish.

2 May 1871. 2908. Having reference to a statement which you made just now, let me ask, was it influenced by the fact that the price of the imported salt was below that of the manufactured salt, or the price at which they could afford to sell?—I think it must have been.

2909. What was the effect upon the price of salt generally in Bengal, shortly after the change of system?—It fell 50 per cent. of the cost. That was its effect upon the consumers.

2910. But on the wholesale price generally of the salt sold in Bengal, what was the effect?—It fell 50 per cent., because the foreign merchants could afford to import salt at 50 rupees per 100 maunds, and the Government had been in the habit of manufacturing it at 100 rupees the 100 maunds.

2911. Can you state from what places the salt was imported into Bengal?—The chief importation is from England, but there is also a considerable importation from the Madras and Bombay coasts, from Scinde, from the Persian Gulf, and a small quantity from Europe, that is to say, from France.

2912. Were there some natural difficulties in the manufacture of salt in Bengal that rendered it so much more costly to make there as to admit of its being manufactured in Bombay, and brought round from Bombay to Bengal?—Yes; the difference is this: that the brine at the head of the Bay of Bengal is more or less diluted by the fresh water of the Ganges, and requires a longer and more expensive process to evaporate than rock salt, or salt of any kind, which is dug out of the earth and boiled and evaporated in that manner.

2913. In fact in Madras and Scinde, and in Bombay it is the pure sea water?—The pure sea water which they are able to evaporate by the solar rays; they cannot do that in Bengal; it requires a boiling process there, and fuel is expensive, and the consequence is that the cost of the manufacture is greater.

2914. You were going to give us the quantities of salt consumed or imported into Bengal under the new system?—Perhaps I had better give you two years, what they were in 1857-58, and what they were in 1868-69.

2915. Can you give us the year after the change?—No, but in 1867-68 the quantity of Government salt sold had fallen to 1,715,000 maunds.

2916. What is to be understood by "Government salt"?—The salt which the Government had manufactured and sold.

2917. But I thought they had given it up at that time?—They had a large stock in store which they had to dispose of.

2918. That was the continued sale of the remainder of the old stock?—Yes; it has not yet been exhausted. The sale of Government salt had fallen, as I have said, to 1,715,000 maunds; the production of excise salt had increased to 53,000 maunds; and the importation of foreign salt had increased to 6,312,000 maunds. The total quantity of salt cleared for consumption had increased to 8,000,000 of maunds. It was in the previous year 7,100,000 maunds.

2919. So that the result was a general increase?—An increase of 1,000,000 of maunds, from

7,000,000 to 8,000,000. This, last year, has fallen slightly.

2920. To what do you attribute that increase of consumption; to the diminution of the price, or to the more improved circumstances of the people during the 10 years?—I think both causes must have had a share in the effect.

2921. Had the duty throughout that time remained the same, or had there been any increase of duty?—There has been an increase of duty only in the saliferous districts, because when the Government discontinued their system of manufacture, it then became easy to prevent smuggling, and thereupon the Government were able to bring those districts under the same system of sale that the inland districts had been under previously, and to exact the full amount of duty from the whole population.

2922. What do you call the saliferous districts?—Beginning from the eastward, Chittagong, Bulloah, Backergunje, Jessore, 24 pergunnahs, Midnapore, Hijelee, Balasore, Cuttack, and Pooree.

2923. That would represent the districts at the head of the Bay of Bengal?—Yes.

2924. Have you any exact information as to what the sale prices were, apart from the duty in the two periods which you speak of?—I think that I have mentioned that, in 1856, the sale price of Government salt varied from 80 rupees to 110 rupees per 100 maunds. You must add that to the actual duty of 325 rupees per 100 maunds, and that gives you the price at which the Government salt was sold.

2925. You say it was selling at 80 rupees per 100 maunds, in 1857; what was it selling for in 1867?—About 50 rupees, plus the duty.

2926. Was there any distress felt amongst the people who were engaged in manufacturing salt when the manufacture ceased?—Considerable distress.

2927. What became of that population?—I am afraid a considerable number of them were swept off the face of the earth.

2928. I suppose they betook themselves to ordinary agriculture?—They were the first victims of the famine in Orissa; they had nothing to fall back upon; they depended entirely upon the Government manufacture; they had no agricultural produce of their own, and a great many of them starved.

2929. But, in all other respects, do you consider that the change was beneficial to the community?—Yes, certainly.

2930. Has any difficulty been experienced in distributing the salt (which is imported at Calcutta chiefly, I presume) over the rest of the province?—None that I am aware of; it is very readily taken by the merchants, and finds its way through the ordinary channels of trade.

2931. Have you heard whether the price remains the same to the ultimate consumer in the interior, or whether he is benefited by the reduction of price in Calcutta?—I have no positive information on that point, but I infer it from the increased quantity of salt taken out for consumption.

2932. Mr. Cave.] Is it the fact, that when the salt arrives at a certain price, the consumption diminishes among the natives?—We have never found it so in Bengal.

2933. Have you heard of it in any other part?—I cannot speak as to any other part of India.

2934. It

2934. It has never risen sufficiently high in Bengal to induce the people to do without it?—Never.

2935. It is the habit, is it not, of the people of India, when commodities get to a certain price, to do without them very readily?—Yes.

2936. When sugar, for instance, gets to a certain price it is exported instead of being consumed?—Yes.

2937. But you have not found that the case with salt in Bengal?—No.

2938. When you stated the fourteen million and odd rupees as the net revenue from salt in 1857-58, I did not quite understand whether you calculated in that the charges of the Revenue Department?—Yes; that is, after deducting the charges of the Revenue Department and the cost of the salt.

2939. So that it was strictly net revenue?—Strictly net revenue.

2940. Sir C. Wingfield.] You have said that the stock of Government-made salt is not exhausted?—Yes.

2941. But I observe that the Government of India, in a Despatch, dated the 20th of September 1869, accounted for a decrease in the revenue expected from salt in 1868-69 by the fact that the Government stock in Bengal was exhausted, and that they had overlooked the circumstance?—They meant to say that it was nearly exhausted, probably.

2942. They account for the falling off of revenue on the ground that it is exhausted?—They speak then only of the revenue from that particular source, but probably they go on, and I think they do go on to say, that it is made up by the customs duty upon imported salt.

2943. Yes; I only mentioned this as being evidence that the stock is exhausted; that is the fact, is it not?—It may be by this time: my information only goes to the end of 1869.

2944. You never heard, did you, that there was any caste prejudice against using the imported salt?—Never.

2945. The duty stands in Bengal now, I think, at Rs. 3. 4. a maund?—Yes.

2946. What was it before 1856 a maund?—It had been reduced to Rs. 2. 8.

2947. When?—It was reduced by successive stages of four annas a maund between 1843 and 1850, I think.

2948. Mr. J. B. Smith.] Reduced from what?—In 1843 it was Rs. 3. 4., that is to say, what it is now, and then it was reduced by successive stages of four annas to Rs. 2. 8.

2949. Sir C. Wingfield.] Then it was enhanced after the Mutiny, was it not?—Yes.

2950. Chairman.] In the accounts that have been laid upon the table for 1869-70 the salt duty in Bengal is stated at 2,583,562 l. gross receipts, the repayments are 34,000 l., and the net revenue 2,549,000 l.; then the charges of collection are 12,000 l., so that the ultimate net revenue after the deductions is 2,537,000 l.?—Yes.

2951. Do you know whether that revenue includes the customs as well as the excise, and every kind of collection from salt?—Everything.

2952. Therefore the item of "customs" in the account does not include any salt duty of any kind?—Certainly not.

2953. Do you happen to have any analysis of that total, so as to show how much is from the

sale of salt?—Not for 1869-70: the latest report that has been received from Bengal upon the Salt Department is for 1868-69.

2954. Sir C. Wingfield.] Do you think the duty of Rs. 3. 4. a maund too high; I mean, do you think that it diminishes consumption?—Certainly not; it amounts to a fraction less than a penny a pound.

2955. Some of this imported salt finds its way into Upper India, does it not?—A small quantity.

2956. I have heard that it has been coming up in rather larger quantities of late years; are you aware of that?—I am not aware of it.

2957. You have heard that in Upper India the salt duties have been complained of as too high, and limiting consumption?—I have heard that there are complaints.

2958. But you have not in Bengal?—Never.

2959. What might be the reason for there being an absence of those complaints in Bengal which are so common in Upper India; is it the greater wealth of the people, do you think?—I believe so; I believe that the agricultural classes who form the bulk of the community are much better off in Bengal than they are in the North West Provinces.

2960. Mr. Dickinson.] Is the salt duty collected in Bengal by the officers of the customs?—The customs' duties are: the excise duties are collected by the officers of excise.

2961. Is there any charge against the salt revenue in respect of the customs' officers of Bengal?—Yes, a proportion of the customs' charges.

2962. And is there any charge against that duty for the Excise Department?—Yes, a proportion.

2963. Does this sum of 12,384 l., given as being the "charges of collection" for the years 1869-70, comprise that proportion of the customs and excise charges?—I believe so.

2964. That seems a very small sum for so large a revenue; are there any other special charges applicable solely to salt, and not to any other department of revenue?—None whatever.

2965. None such as watchers?—There is a preventive establishment.

2966. Is that specially for salt?—Yes, specially for salt.

2967. Is it large in Bengal?—Considerable.

2968. Then the whole charge seems to be 12,000 l. against salt?—No, it is more than that; it is 74,000 l.

2969. That is including drawbacks, is it not?—But there is no drawback.

2970. You will see a heading for "drawbacks"?—Yes, but it is blank. The charges for the previous year 1868-69 were one million of rupees for Bengal; that is 100,000 l.

2971. The drawbacks, I presume, would be a mere matter of account; they would not be an item of charges of collection?—No.

2972. You think that there is some mistake in this amount of 12,384 l.?—I think there must be some mistake there, because this statement which I have before me, which is a statement prepared by the Board of Revenue, is, I have no doubt, correct.

2973. Chairman.] It might be an explanation of the matter that the amount of salt sold was deducted from the charges?—No; because the quantity of salt sold is so very small; I cannot explain that entry in the accounts.

T

2974. You

Sir
C. Beadon,
K.C.S.I.

2 May 1871

Sir
C. Beadon,
K.C.S.I.
2 May 1871.

2974. You are aware that we have not the same year as that which you have just given?—No; but it must be much more than that.

2975. The charge for collection in the account of 1867-68 for Bengal is 11,705 l.?—According to my accounts it is 1,007,288 rupees for Bengal alone, which is 100,000 l.

2976. In the account before us it is described a little more in detail; "Bengal Salt Agents Salaries, Establishment, and Contingent Charges, 11,705 l.;" that is for the year 1867-68?—Then they have left out the whole expense of the preventive establishment, and I do not know where that is charged.

2977. That would probably be charged to the general charges of the excise or customs; perhaps this charge is exclusively confined to the special service for salt as appearing in these accounts, and the other charges go into the excise and customs charges?—I think not; there is a large special establishment employed for preventing the smuggling of salt in Bengal, and that must be charged somewhere. It is charged in this account of mine I have no doubt, but where it is charged in the general accounts I cannot say.

2978. Mr. Dickinson.] Will you tell me what the salt agents are?—There are no such people now.

2979. In 1869-70, I presume there were salt agents, because it says, "Salt agents' salaries, establishment, and contingent charges, 12,384 l.?"—They came to an end when the Government manufacture was abolished; that was six years ago; they kept up the old nomenclature in the accounts however, and did not change it.

2980. Mr. Fawcett.] I suppose from your knowledge of India you consider salt almost a necessary of life, do you not?—Not more in India than elsewhere.

2981. I suppose it is always a necessary, but still a vegetable diet, like rice particularly, requires salt, does it not?—I am not aware that it does more than any other kind of diet.

2982. Still it would not be incorrect to describe it generally as a necessary of life?—It is a necessary of life all over the world.

2983. And the duty now upon it in Bengal is Rs. 3. 4. a maund, is it not?—Yes.

2984. And I understood you that the price of it, duty free, in Bengal, was about half a rupee a maund?—Yes.

2985. So that the duty is a duty of 700 per cent.?—Yes.

2986. In some parts of India, close to where salt is produced, the price of the salt, duty free, is even less than half a rupee per maund, is it not? I mean close to the salt lakes and salt wells?—I cannot say that the price of salt there is less. I am not aware that it is, but no doubt individuals might manufacture it themselves for less.

2987. Considerably less?—Probably.

2988. I have seen it stated that in parts of India if the salt were duty free, and people were allowed to manufacture it as they liked, they could manufacture it at an eighth of a rupee per maund?—For their own consumption probably they could.

2989. Three rupees four annas is the least duty charged now upon salt, is it not?—No, the highest.

2990. Is there in any place a less duty charged?—In other parts of India much less is charged;

in Bombay and Madras and the North West Provinces.

2991. Is there less duty charged in these places where you say the people might manufacture it themselves for an eighth of a rupee per maund?—In Madras and Bombay, but not in Bengal.

2992. In some parts of Bengal there are places where they could manufacture it for themselves at an eighth of a rupee per maund?—Yes.

2993. So that in Bengal it comes to this, that on a prime necessary of life there is a minimum duty imposed of 700 per cent., which rises in some districts to a duty of 2,800 per cent.?—Just upon the margin of the sea.

2994. Do you think that the fiscal history of any civilised country in the world would furnish an example of such a duty as that?—I cannot say.

2995. It is a subject which you have never looked into?—No.

2996. Do you think it is possible to raise the duty upon salt more?—Do you mean possible or expedient?

2997. Possible or expedient; do you think that you would raise more revenue in the first instance, if you did raise the duty?—Yes, I think you would.

2998. Do you think it would be expedient?—It is difficult to answer that question absolutely; it must depend upon the circumstances under which revenue is required by the Government.

2999. But can you conceive any purposes for which revenue would be required by the Government which would justify a Government in imposing, upon a necessary of life, a duty of more than 700 per cent., and, in some instances, more than 2,800 per cent.?—Yes; because I think that the expediency of a tax must be measured rather by the ability of the people to bear it and to pay it, than by any calculation of per-centage as to its original cost.

3000. But do not you think it would be a strong argument to condemn a foreign power having anything to do with the government of a people, if they cannot govern it without imposing such duties as this?—No, it does not strike me in that light.

3001. I believe, before the English Government had anything to do with India, no such tax was imposed upon the people?—They paid a salt tax.

3002. But can you tell me what it was?—It was much less than that.

3003. Not a 10th, was it?—I do not think that the extent was ever ascertained. The taxes were farmed in those days, and the farmers got what they could out of the people.

3004. I have seen it stated, that it was not a 10th of the present tax, and you do not know that that is incorrect; you simply know that it was very much less?—I dare say it may not have been more than a 10th.

3005. Then do not you think it is one very serious cause of discontent to a people, if you find that a tax on a first necessary of life, imposed by an alien government, is increased ten-fold?—I do not know what it may be in the abstract, but, as far as Bengal is concerned, I can safely say that I never heard a word of discontent, from any class of people, in respect of the salt tax.

3006. There is grave discontent with regard to

to it in many parts of India, is there not?—I am not aware. I have heard that there have been complaints in the North-West Provinces that the salt tax there is too high.

3007. Did I correctly understand you just now to say, that since the Government gave up the manufacture, and salt had been made somewhat cheaper in consequence of that, the consumption of salt had, in some parts of India, greatly increased?—Yes.

3008. Then, putting it in a different way, the consumption of salt varies with its price?—But it has equally increased after the Government has increased the duty; the increase is annual and regular, and has never been checked by the imposition of duty, neither has it been greatly stimulated by the reduction of duty.

3009. But then that seems contradictory; I do not quite understand your original answer in reply to the Chairman, in which you said that owing to the price having been reduced the consumption had considerably increased; if you do not wish to convey to the Committee the idea that the reduction of price has anything to do with the increase of consumption?—I only mentioned the decrease in price as one of several causes; another cause is the improvement of the condition of the people; a third cause was mentioned by Sir Charles Wingfield, namely, the increase in the quantity exported to the North-West Provinces.

3010. If the financial exigencies of India should increase, do not you think, considering the enormous duty now imposed upon salt, that it would be desirable, if possible, to avoid resorting to it for any increase of revenue?—If I may be allowed to give an opinion upon a point which embraces something more than Bengal, I would say that one of the first legitimate objects of additional taxation in India would be the salt of Bombay and Madras, which now pays about one-half of the duty which the salt of Bengal does.

3011. You would suggest, then, as a measure of general expediency, not to equalise the duties by reducing them, but to equalise them by raising the lower ones up to the highest standard?—Speaking of salt, I do.

3012. Would you carry out that throughout India?—No; but if additional revenue is wanted I should think it a very safe and legitimate mode of obtaining that revenue by increasing the salt tax in Madras and Bombay, so as to bring it up more nearly to a level with that of Bengal.

3013. I think you referred just now to the people in Bengal as being better off than the people in other parts of India; better off, I think you said, than they were in Madras and Bombay, taking the great mass of the people?—I only spoke of the condition of the people of Bengal in comparison with those of the North-Western Provinces.

3014. Do you know what the duties are in the North-West?—I believe they are three rupees a maund.

3015. Then the duties in the North-West are almost exactly equal to what they are in Bengal?—There is a difference of four annas, that is to say, one-thirteenth.

3016. You have recognised the principle in a previous answer, that one principle of taxation should be, as far as possible, to levy it in proportion to people's ability to pay?—Yes.

0.59.

3017. Then bearing that principle in mind you would have considerably to reduce the salt duty in the North-West, would you not?—I really do not know much about the condition of the people in the North-West, but if, as I suppose, their circumstances are very much worse than those of the people in Bengal, it might possibly be expedient to reduce the tax on salt there.

3018. And that might be the case in other parts of India?—No; I believe the people of Madras and Bombay are quite as well off as the people of Bengal, and they pay very much less duty on salt than the people of the North-Western Provinces do.

3019. Do not you think it undesirable to have a duty which varies in different parts of the country so enormously in proportion to the value of the article?—No; I am rather an advocate for provincial taxation in India; I think the taxation of each province ought to be regulated according to the circumstances of that province.

3020. I understood you just now that you were in favour of something rather different, in favour of equalisation?—That was merely as a question of fairness.

3021. Have you formed any estimate of the maximum which you think it would be expedient to increase the duties to; in fact could you give us any idea of how much more, under a state of financial exigency, or emergency, you might hope to get out of the salt duty?—I have looked at it in this way. I mentioned before, that the duty on salt is something under a 1d. a pound; and I believe that the imposition of that duty does not in the slightest degree affect the consumption in Bengal, nor is it felt by any class of the population. I think it therefore very probable, if not certain, that some addition might be made to that tax, if it were absolutely necessary, without causing any severe burden to fall on even the poorest class of the population.

3022. Do you think that the tax might be increased to the extent of 50 per cent.?—I have never contemplated anything like that.

3023. Would you give an idea of what you have contemplated as a possible increase?—I never contemplated anything more than 2 annas, and that was because it so happened that money was wanted for local purposes. When I was Lieutenant Governor of Bengal a certain proportion of the first income tax, imposed by Mr. Wilson, was set apart for public works in Bengal; and when that ceased, the Bengal public works were suddenly deprived of an income of about 12 lacs of rupees, and the Government of India wished to know how that could be supplemented, and they asked if it could be supplemented by local taxation. I then had to cast about me for means of local taxation, and after a good deal of thought and inquiry I came to the conclusion that the least objectionable mode would be to put on 2 annas to the salt.

3024. So that the elasticity of this salt revenue which you contemplated, that is to say, the rise in the revenue, which you contemplated, is to increase it not by a large amount, but by an increase of about 5 per cent, which, in the case of Bengal, would bring in about 120,000 £.?—Yes.

3025. That is the increase which you contemplate as possible?—Yes.

3026. I have seen it stated in an article attributed to a certain Lieutenant Governor of Bengal, and given on his authority that there has been

Sir
C. Beadon,
K.C.S.I.

2 May 1871.

Sir
C. Beadon,
K.C.S.I.
—
2 May 1871.

been a considerable increase in the salt duties lately in India, since the mutiny?—Yes.

3027. Could you give us the items of that increase?—Before I answer that question I wish to correct an answer which I gave to an earlier question which the Chairman put to me. I stated that at the time of that report, in 1856–57, the duty was Rs. 3. 4. That was a mistake; it was then Rs. 2. 8. The Rs. 3. 4. duty, was not imposed till after the mutiny in 1858.

3028. Then since that time has there not been any increase in the salt duty?—Not in Bengal.

3029. But in other parts of India has there been any increase?—Yes; in Bombay and Madras.

3030. Do you know the increase?—I cannot speak accurately to it.

3031. The duties have been doubled in those cases?—Nearly doubled; they were very low before.

3032. You said that the salt duty is not felt by the great bulk of the people; you saw a great deal of horrible suffering in the famine in Orissa, was it not felt by the people there, had they not a difficulty in getting salt?—Their difficulty was in obtaining rice.

3033. But if they had to spend so much more on salt, they had less to spend on rice?—The expenditure on salt is so very small as compared with the expenditure on rice, that it would hardly be felt; the one is swallowed up in the other. A man who is starving for want of rice does not trouble himself about salt.

3034. Mr. Birley.] Did I understand rightly, that in 1843 the duty was Rs. 2. 8.?—It was reduced to Rs. 2. 8. in 1843 or 1844.

3035. And you tell us that you think that the natives really get sufficient for their own consumption?—I have every reason to think so.

3036. What are about the wages of a labouring man in a country district in Bengal?—It varies very much.

3037. It is often not more than 1*d.* or 2*d.* a day, is it not?—I never heard of its being so low as that.

3038. I suppose that the price of salt is very much enhanced by the carriage?—Not very much; 5 or 10 per cent., perhaps.

3039. Do you mean that salt could be carried up from Calcutta, and penetrate into the rural districts of Bengal, far from the rivers and ordinary means of communications, without very much enhancing the price?—When I was Lieutenant Governor of Bengal, I used to have before me statements of the retail prices of salt in all districts of the country, and I cannot recollect, under any circumstances, in the most distant province, their being higher than Rs. 4. 8.; and I think ordinarily they were from four rupees to Rs. 4. 2., or Rs. 4. 3.

3040. I was in India in 1844, and I certainly understood that the cost of salt was a very serious pressure on the native population of Bengal at that time, and that in the neighbourhood of Calcutta even it was so; that is not your impression?—I never heard it; and I made it my business to make very close inquiries frequently on the subject.

3041. And that if not actually essential it was the condiment to their ordinary repast, which it was hardly possible to dispense with, because rice would be very unpalatable without it?—Some years ago the Government instituted

inquiries into the consumption of salt by the natives of India, and they took specimens from every class; they made inquiries as to the quantity of salt consumed in a family, and they took a family of a European, a family of a well-to-do native, a family of a man of the middle classes, and a family of a man of the lowest classes, several of each class, and the result was that with very trifling variations indeed, the consumption of each family per head of the family was found to be six seers, that is 12 lbs. a head in a year; and there was no material difference between the consumption of the richest man and the consumption of the poorest man, on the average. Now, if you take the population of Bengal to be 40,000,000, as I see it so stated in the last statistical return, and the amount of salt sold to be 7,250,000 of maunds, you will find that it gives a consumption of 14½ lbs. per head.

3042. A great deal of the salt goes to the North Western Provinces, does it not?—Not a great deal; some does.

3043. Is there much fraudulent manufacture of salt in the saliferous districts?—Yes, a good deal in a petty way.

3044. And is salt produced anywhere beyond the interior of Bengal?—An insignificant quantity of salt is produced in the district of Tirhoot, and the other districts of the Behar Province, in the course of the manufacture of saltpetre; but not otherwise.

3045. You rather surprise the Committee, I think, by telling us that the Government had no difficulty in selling their salt at the price of 100 and 110 rupees per 100 maunds, at the same time that the importers were selling it at 80 rupees; did the Government keep up that price with the remainder of its stock?—No, it reduced it. As long as the Government kept up the system of manufacture, it was considered to be only fair to the importers that the Government should charge the full cost of the manufacture; but when the Government ceased to manufacture, and was left with a large stock of salt upon its hands, then it was considered perfectly fair, in order to get rid of this large quantity of salt, and to realise the duty upon it, to abate somewhat of the original cost price.

3046. Mr. Beach.] With reference to what was stated just now, various causes, I presume, would prevent an exact deduction being drawn from the amount of the salt tax formerly levied to what is levied at present; it is stated that it might have been one-tenth that was levied in the old times; but various causes, such as the rise in the value of money, the ability of the people to bear the tax, and other causes, might prevent there being an exact deduction from the proportion which the tax bore then to what it is now?—Such causes, of course, are always in operation. Prices generally have risen throughout the country; prices of all kinds of provisions have risen; I suppose at least 50 per cent. throughout Bengal; but salt has remained stationary, or rather has diminished.

3047. And in former times there was a great discrepancy, I believe, between the amount which was levied upon the people, and that which was realised in the treasury of the native princes?—I have no doubt that the farmers of the revenue made a large profit on what they took. The revenues in those days of the native princes were farmed out.

3048. Did the Government make any profit by

by the manufacture of the salt that it sold in Bengal?—Their profit is represented by the duty.

3049. Simply by the duty?—Nothing but the duty.

3050. But if the prices fell at once 50 rupees, why could they not manufacture it as cheap as other people?—Because, as I endeavoured to explain to the Committee just now, the expense of manufacturing salt in Bengal is greater than the expense of manufacturing salt in England and conveying it to Bengal; the reason being, as I stated before, that the brine at the head of the Bay of Bengal is largely diluted with the fresh water of the Ganges, and consequently requires a much more expensive process to evaporate it.

3051. It is stated, I think, that an illicit traffic of about 1,000,000 of maunds prevails throughout India in salt; is there a large proportion of that existing in Bengal?—A very minute proportion indeed.

3052. You consider the amount of the salt tax a fair test of the prosperity of the people?—I do not know that it is quite accurate to say that it is a fair test of the prosperity of the people; it is a test, no doubt.

3053. It is a tax which does not bear very heavily, and it is an article of universal consumption?—I think that the fact that they are able to bear it shows that they must be in a prosperous condition.

3054. Mr. Baring.] Is the fraudulent production of salt on the increase at all?—No, on the contrary; since the Government have given up the manufacture of salt it has been greatly on the decrease, being so much more easily prevented.

3055. Is it possible that from one part of the country where the duty is very low there can be smuggling into a part where the duty is high?—Yes, and such smuggling does take place, not to any very great extent, but still it does take place from the Madras districts on the Ganjam coasts into the Cuttack districts; and the Government has to keep up a cordon of preventive officers to put a stop to that illicit traffic.

3056. That would be rather an argument for equalising the duty, would it not?—It is. Speaking as a Bengalee, I may say that we have always felt it a great grievance in Bengal that we should have to keep up a cordon of preventive officers because the Madras people tax their salt less than we tax ours.

3057. Is there any smuggling of salt imported from England?—None; it is not possible.

3058. Sir D. Wedderburn.] I think you said that you did not consider the salt in Bengal as more a necessary of life than in other countries; am I right in believing that in Bengal rice is the staple food, and that, except in the form of butter, animal food is hardly consumed?—They consume a great deal of fish.

3059. In parts of India, where the supply of salt is insufficient, are there prevalent any particular diseases among the people?—Certainly no diseases have ever been prevalent in Bengal that I have heard attributed on any good authority to the want of salt.

3060. Sir J. Elphinstone.] What do you state as the full allowance of salt per year to an adult?—I mentioned to the Committee just now that the inquiries made on that subject by the Government some years ago, resulted in this, that the

average consumption per head in a certain number of families of all classes, was six seers, that is 12 lbs. a head. Of course if the average consumption is 12 lbs. a head, the consumption of an adult must be more than 12 lbs. a head, because it is not to be supposed that infants consume as much as adults.

3061. What do you consider the annual cost to an individual of the salt which he consumes?—I make out that taking the present consumption of salt, and the population of 40,000,000, it gives 14½ lbs. per head, and the tax is about 1 d a pound, so it is about 14 d.

3062. He pays 14 d. a year to the revenue?—Yes.

3063. It operates as a poll tax?—Yes.

3064. Chairman.] That is, including man, woman, and child?—Yes, the average per head.

3065. Sir J. Elphinstone.] If the salt duties were repealed, would it be possible to substitute any other impost that would produce the same result?—I think not without an immense amount of suffering and oppression; and nobody can tell what consequences.

3066. Have any proposals been made to equalise the duties on salt in the smaller presidencies later than 1868?—I believe there have, but I cannot speak positively.

3067. You cannot state from your own knowledge that the matter has been considered since that time?—No; I have ceased to have any official connection with the Government since 1867, and therefore as to any thing since, I can only speak from what I hear.

3068. I believe that there are something like 10,000 men employed in guarding the line of customs frontier?—I have no knowledge of that, it does not form any part of the Bengal administration; it belongs to the North Western Provinces entirely.

3069. Mr. J. B. Smith.] Is the carriage of salt from one place to another a very important element in its price?—If you calculate it upon the prime cost of the article, it is, but if you calculate it upon the price the public pay to the Government for it, that is to say, if you calculate it upon the price with the duty, then the addition of the cost of carriage is insignificant.

3070. Do the Government forward the salt to different parts of the country for sale?—No.

3071. Then whoever buys of the Government, must of course add the price of the carriage to the salt before he can make a profit out of it?—Certainly.

3072. Then if the price of the carriage of salt be 2 l. or 3 l. a ton from one place to another, of course it must increase the price of the salt?—It increases the price of the salt by the cost of the carriage, whatever that is.

3073. Then does not the price of salt depend very much in different places upon the facility of obtaining their salt by means of canals, or rivers, or roads?—Yes, of course those people who live more distant from the great lines of traffic have to pay more for their salt than those who live upon those lines of traffic.

3074. Supposing that there are no roads, and the salt is carried on the backs of bullocks, would not that add very much to its cost?—Yes.

3075. In fact it would be equivalent to a tax upon it?—I do not see how it could be equivalent to a tax; it would be an addition to the price.

3076. If, by means of a railroad, for instance, they

Sir
C. Beadon,
K.C.S.I.
2 May 1871.

Sir
C. Beadon,
K.C.S.I.
2 May 1871.

they could obtain salt at half the price which they formerly paid for its being carried on the backs of bullocks, it would be equivalent to a diminution of the tax?—It is equivalent to a diminution of the cost of carriage.

3077. Supposing you undertake to convey the salt to a certain point, free of expense, the purchaser of the salt would then only have to pay the same price at that place which he would have to pay at the place where the salt came from?—Yes.

3078. But if you, instead of that, oblige him to carry it, and he is put to a great expense in consequence of bad roads, then that operates in the same way as if you put an additional tax upon it, does it not?—It may operate in the same way, but it is a very different thing from a tax, as I understand it.

3079. It operates in the same way as a tax?—Yes, it enhances the price, of course.

3080. Do not you suppose that the establishment of railroads in Bengal, for instance, has very much facilitated the carriage of salt, and so has cheapened it?—Greatly, in all those districts which the railways permeate.

3081. The price of salt has therefore been lowered?—Yes, probably.

3082. And therefore the establishment of roads and railroads is equivalent to a reduction of taxation?—Unquestionably, in that point of view.

3083. Is not that a very important point of view?—I think it is.

3084. We hear that the consumption of salt is very much increased. Is not one reason of that increase the diminution in price which has been caused by cheapness of conveyance?—Hardly, I should think; it may be one among many causes, but not a very potent cause, in Bengal.

3085. Do not you think that it must be the case in every place. I have a return from Nagpore, and the consumption there, in consequence of the high price of carriage, in the year 1862, was only 5 lbs. a head; the consumption is said to be in other parts of India 20 lbs. a head, and the consumption in Pondicherry is said to be 30 lbs. a head. Must not that be owing to the price?—I should think it was.

3086. *Chairman.* Do you think that the consumption in Pondicherry arises from the fact of the fish being cured with salt at Pondicherry?—I think it is extremely probable.

3087. It might affect the rate per head of the consumption, if there is a large curing of fish for the interior?—Any industry of that kind would largely increase it. Salt used for curing fish in a small area, intended to supply a very large area, would of course very much add to the average consumption of salt in the smaller area.

3088. Is Nagpore, do you suppose, supplied at all with salt from the Bengal Provinces, or is it supplied from Bombay?—Certainly not from Bengal, probably from Bombay.

3089. Do you know whether any of the rock salt is brought down from the north to Nagpore?—No, I cannot speak positively.

3090. *Mr. J. B. Smith.* I believe that Nagpore is supplied with salt from Madras?—I should think, most probably, that it would be supplied from Bombay.

3091. If you make a railway to a certain place, and by means of that railway you are able to convey the salt, we will say, at a 1d. a pound less, the people would not be any worse off if you

were to impose an extra 1d. a pound duty?—It is the same thing.

3092. Therefore, if the Government were to go to the expense of making the railway, they could, if it were necessary, impose a higher duty, owing to the saving that was effected by the carriage on the railway, and the people would not be worse off?—The opening of a railway in any part of India improves the condition of the people in all respects; not in respect only to their salt, but in respect to everything. Salt is only one small item in the whole amount.

3093. I think you stated, that there were some public works executed in Bengal, and that in consequence of the cost of those works to the Government, an extra duty was laid upon salt?—No; I said, that when the payment to Bengal out of the first income tax ceased, the Government of Bengal had to consider how it was to replace the deficiency; and I then went on to state, that a tax of two annas a maund on salt had occurred to me as the most expedient mode of raising the funds that were required to make up the deficiency; but no proposal to that effect was ever formally made.

3094. Was that deficiency occasioned by the execution of public works?—No; the deficiency was occasioned in this way, that when the first income tax was imposed, 1 per cent. of it was given up to public works. The consequence was, that an allotment of that 1 per cent. was made to the Bengal Government every year for public works, and an impression arose, I will not say whether justly or not, that that would be continued; but when the five years of the income tax ceased, the 1 per cent. ceased, and the Government of Bengal found itself embarked in undertakings of considerable magnitude without any means to meet the expense of those works, and they therefore had to cast about for means to make up that deficiency. It was then that a tax of two annas upon salt occurred to me as the best mode of meeting that deficiency; but it never was proposed officially.

3095. Then it was not adopted?—No.

3096. *Sir T. Bazley.* You have spoken of the Government sales, and the wholesale price of salt in Bengal; can you tell the Committee what the augmentation of price has been for carriage and dealers' profit, and, in fact, what has been the price that the consumer has been paying?—I endeavoured to explain to the Committee, in a former answer, that, taking the returns which I was in the habit of receiving from all parts of Bengal, I do not remember ever hearing that the price of salt, in any part of Bengal, was higher than Rs. 4. 8. a maund.

3097. Would that be an increase of 25 per cent.?—Much less than that; it would be more than that upon the cost of the article, but much less than that upon the cost, plus the duty.

3098. Then you think on the whole that the people of India are being supplied with salt at a moderate price compared with the cost at which it was obtained from Government?—Yes, I think so.

3099. Are you aware that new supplies of salt have been obtained in any part of India; have there been new sources of supply brought into the market from India itself?—The North Western Provinces of the Punjab are supplied with salt from the Sambhur Lake and from the Salt Range of the Punjab Hills, and salt is also made in Scinde.

3100. And

3100. And have those increased supplies of salt had the effect of diminishing the cost to the consumer?—Not in Bengal, because they have never entered into the Bengal consumption.

3101. *Mr. Lyttelton.* You have told us that this tax operates virtually as a poll tax; can you tell us why a tax which is obviously open to such objections, in theory at least, should be specially applicable to India?—Simply because the people do not pay indirect taxation in any other form.

3102. Can it be stated that the poorest classes of India pay less to the Government in respect of duties on necessities than the poorest classes in England, for instance?—They pay absolutely nothing.

3103. Not in the shape of clothing?—No; the poorer classes of India do not buy clothes that pay duty.

3104. It is the fact, then, that this is the only way of reaching them?—Except, what is a very small exception, in regard to the duty upon spirits and drugs, the salt duty is the only indirect tax which the poor man in India pays.

3105. Spirits and drugs cannot be regarded, in India at least, as a necessary of life?—No, certainly not.

3106. You regard the tax as theoretically good in India; it is not one which you would take off supposing a large surplus were at the disposal of the Government?—It would be one of the last which I should take off.

3107. Even if reduced, you would always retain it as a source of revenue?—Certainly; it is the only means by which you can make the lower classes in India contribute to the expenses of the Government.

3108. If it is a virtual poll tax, in what way is it better than an actual poll tax?—It is collected with the greatest possible ease, and without the slightest oppression.

3109. *Mr. Fowler.* I understood you to say in answer to Mr. Fawcett's question, that though the duty under the native princes was much less than it is under the British Government, yet it was farmed in a way which brought it up nearly to the amount at which it now stands?—That was a point on which I could not give any positive opinion at all; I said it was probable that the farmers derived great profit from the sale of the salt.

3110. But there is no accurate information to be had on the subject?—None whatever.

3111. *Mr. B. Denison.* In the Finance Minister's financial statement for 1869-70, there occurs this paragraph: "The revision of the salt duties throughout India has engaged, and is still engaging our anxious consideration. The inequality in the rates of duty and the market prices of such an article as salt in different portions of the empire is indeed to be deplored. But though there are present obstacles, financial and other, in the way of equalization, we shall bear this steadily in view as an object for ultimate attainment. But after all, what the northern people want, even more than reduction of duty, is increased facility of supply, by the construction of railways to the saliferous tracts, and by the encouragement of local manufacture of salt, to all which matters immediate attention is being afforded." I suppose that that was very much your own view while you were in India, that it was an object to equalise as far as possible the selling price of salt, the cost to the consumer in

different parts of the country, I mean as far as it depended upon the salt tax?—As I said before, we in Bengal always considered it a grievance that the salt in other parts of India was not so highly taxed or not nearly so highly taxed as our salt was; but at the same time I do not deny that there may be some local circumstances which would render it expedient not altogether to equalise the tax in all the provinces.

3112. Do you know what are the considerations which hitherto have prevented an approach to the equalisation of the salt duty in Bombay and Madras; has it been from Imperial considerations?—Entirely from local ones. The Government of India have repeatedly pressed upon the Governments of Bombay and Madras to enhance their duties, and have always been met with the strongest objections; and it has been in defiance of those objections, I believe, that the duty in Bombay and Madras has from time to time been raised to its present pitch.

3113. I find in a similar statement for 1870-71, the Finance Minister says, "The salt revenue has been taken at 6,177,370*l.*, an amount considerably over that of the previous year, chiefly because the increased duty in Madras and Bombay (five annas per maund) is to operate for the whole of 1870-71." Then there has been, since you left India, some attempt at equalising the duties?—Yes; they are still far from equal.

3114. Was it ever in contemplation while you were in India, actually to equalise the duty for Madras and Bombay?—No, I think not.

3115. As a matter of Imperial finance, the revenue from salt in Madras is about 1,165,000*l.* gross, and in Bombay 600,000*l.*; therefore any increase upon the salt duties of those two presidencies such as you contemplate, would really not give any very considerable increase of revenue, because the total is about a million and a half; and I think you said, in answer to one of the honourable Members, that you never at any time contemplated a larger increase on existing duties than two annas a maund?—That was speaking of Bengal: in Bengal that would give 10 *lacs.*

3116. You still think it quite sensible to raise the salt tax in the two Presidencies of Madras and Bombay?—I know no reason to the contrary.

3117. As regards the hardship of the tax which honourable Members have pressed upon you, would it not be right to say that in those districts of India where the salt tax and the price of salt perhaps is highest, the other necessities or staples of life are somewhat lower than they are in the other parts of India?—That is certainly true in regard to Bengal, and I should think it most probable in regard to all parts of the country. Taking Calcutta as a centre, provisions are dearest at that centre, and gradually get cheaper as you radiate to the frontier in all directions. On the other hand, salt, which is cheapest at the centre, gets dearer as it gets to the circumference of the circle.

3118. Also down in the districts in which the means of communication are the worst, and the roads fewest, agricultural produce is sold at a very much lower price than elsewhere?—Yes.

3119. So that there is really a natural compensation in these things?—To that extent there is.

3120. And in no sense can it be said that at the present moment the salt duty presses to that degree

Sir
C. Bendon,
K.C.S.I.
2 May 1871.

Sir
C. Beadon,
K.C.S.I.
2 May 1871.

degree on the population, that from Imperial reasons it ought to be reduced?—I am quite satisfied that in Bengal the tax upon salt does not press severely upon any class of the population.

3121. Mr. J. B. Smith.] Am I wrong in inferring from your evidence that you think that the outcry against the tax on salt has been very much exaggerated?—I think it has been very much exaggerated indeed.

3122. And in your opinion the burden of the salt tax has been very much diminished, first by the rise in the rate of wages, and secondly by the diminution in the cost of the conveyance of salt?—Yes.

3123. And therefore whatever the burden might have been in times past, it has been very much lessened from those causes recently?—Yes.

3124. Mr. Grant Duff.] The part of India of which you have been speaking from your own knowledge, the Lieutenant Governorship of Bengal, is a region larger than France, is it not?—Yes, considerably.

3125. About as large as the Austrian Empire?—It is about 200,000 square miles.

3126. As to all that vast region, you can say, of your own knowledge, that the salt tax does not act in any way oppressively?—I can say negatively that, as far as my knowledge goes (and I ought to have some knowledge of the circumstances of the province in all its parts), I do not believe that the salt tax presses heavily on any class of the population in any part of Bengal.

3127. And you would say, I suppose, with regard to Bengal, that the impression which prevails against the salt tax in some quarters in England, is a reflection from speeches of English orators of the last century?—I do not think that the opinion arises from anything that has ever been said by natives of India, by those who actually bear the burden of the salt tax; I do not think that the complaints which have been made against the salt tax have arisen in any way from any complaints made by the tax-payers themselves.

3128. And it results, from your evidence, that even in Bengal, where the tax is now considerable, you think that if the exigencies of the State require it, it might be increased moderately, without any approach to oppression?—I think so.

3129. Chairman.] What is your idea of a moderate increase in this tax in Bengal?—It is very difficult to give an opinion on that point.

3130. In using the phrase "moderate," do you mean something like 5 per cent., or do you contemplate anything more as moderate?—I said, in reply to a question from an honourable Member, that I had contemplated an addition of two annas in the maund.

3131. But dealing with the finances of India, supposing that there was a deficit, what would you consider, in your view of moderation, a moderate increase of the salt duty in Bengal to make good the deficit?—Putting things at the worst, and supposing an absolute necessity for additional taxation, my belief is that you might increase the salt duty of Bengal by 25 per cent. of its present amount, without its being felt.

3132. Do you know whether on the inland frontier of any part of Bengal, except that which

you have spoken of near the Madras coast, the foreign salt, so to speak, meets the Bengal salt and passes the frontier?—The salt from the Sambhur Lake, and other parts of Northern India, meets the Bengal salt at a point somewhere below Allahabad. Formerly in order to equalise the rates of duty between the North Western Provinces and Bengal there used to be a duty of four annas taken at Allahabad upon all north-western salt passing down into Bengal, in order that the consumption of the Bengal highly-taxed salt might not be interfered with below Allahabad. But that was taken off some years ago, and things are now left to their natural operation; and now, practically, I believe the Bengal salt finds its way up nearly to Benares.

3133. Then, passing round to the further frontier, do you protect yourself against the rock salt, from Malwa, by any differential duty?—No, there is no differential duty anywhere. The only means that we have to protect ourselves from the highly-taxed Madras salt, is the rude expedient of force, by a cordon of preventive officers.

3134. But supposing they wished to pass the salt across from Madras to Bengal at any point, do you prohibit it absolutely, or do you allow them to do it on paying any differential duty?—No, it is absolutely prohibited.

3135. Is that the case with reference to the Bombay salt?—I never heard of any Bombay salt finding its way to Bengal.

3136. But is there any law by which it is prohibited, or is it allowed to come on paying a differential duty?—I never heard of any Bombay salt finding its way to Bengal, except by sea.

3137. Is there any law on the subject by which it would pay a differential duty?—Bombay salt could not find its way to Bengal without passing either through the North Western Provinces, or through the Central Provinces, so that it would have to pay its differential duty before it got there.

3138. It would be treated then as liable to the full duty?—The question has never practically arisen in Bengal. You see all the Bombay salt that could possibly come by land to Bengal must pass either through the North Western Provinces, or through the Central Provinces. The difference might be taken there; but about that I know nothing. But we in Bengal have never even thought of dealing with Bombay salt, because it has always been considered impossible for the Bombay salt to find its way overland by reason of the distance.

3139. To go to the point of consumption, I think you stated that the duty amounts to 1d. a pound?—It is a fraction under 1d. a pound.

3140. And that, the average consumption would be about a pound weight a month?—Yes.

3141. Therefore the charge would be 1d. a month on each individual?—A shilling a year.

3142. What do you consider to be the earnings of a family of five persons of the working classes in Bengal per month?—It varies very much indeed. In the neighbourhood of Calcutta the people are very well off; the lowest order of people, the men who carry about earth on their heads, who are the lowest class of labourers, get 6 annas a day.

3143. That is in Calcutta, and in the surrounding districts?—Yes; near where any railways have penetrated, or any great public works have been

been carried on, or any expenditure of money in large undertakings has been incurred, the wages are 6 annas a day.

3144. But what may be taken to be the earnings of a family for a month in the rural districts not affected by this sudden demand for hard or strong work?—I should say in the generality of the rural districts wages are not less than 4 annas a day, or 6 *d.* a day, that is 15 *s.* a month.

3145. That is the wages of a strong man, a full able-bodied man?—Yes, and women and children get half.

3146. Do you think that we may take the earnings of a family of five persons as being 8 annas?—A little over 1 *s.* a day, I think you may take it.

3147. Then it would seem that if a family is taken to consist of five people they would pay 5 *d.* a month salt duty, and they would earn 1 *s.* a day?—Yes; they would get 30 *s.* a month.

3148. That is your opinion of the ratio of the charge of the duty upon the working classes in Bengal?—Yes.

3149. Except those who live near their large cities and railway stations?—They would be better off; but still there is a large class of labourers, particularly in North Western Bengal: the Behar Province, who do not get such high wages as that; not more than 3 annas a day; you must cut off 25 per cent. from the earnings of a family of five in that case.

3150. Mr. *Fawcett.*] Am I not correct in supposing that in some parts of India, such as the north west, a labourer does not earn more than 3 *d.* a day?—I cannot speak about the north west.

3151. But you have known such cases, have you not, in the rural districts of Bengal?—Never.

3152. You have not heard it stated that a man earns less than 4½ *d.*?—Never less than that.

3153. If a man is married he may have a wife and three children who do not earn anything?—The wife generally earns something.

3154. But supposing the children are very young, it often happens that the mother cannot earn anything?—It may be so.

3155. Therefore this may occur, that a man, his wife and three children, have to live upon an income of 4½ *d.* a day, according to your own statement?—Yes, such things may happen.

3156. You stated in answer to a previous question, that whether people were poor or not they consumed about the same quantity of salt? On an average.

3157. And that that quantity was about 14 lbs. per head per year?—I said that that was the deduction from the quantity of salt sold, thrown over the population, but according to the inquiries made it is 12 lbs.

3158. Then that would represent a charge for five persons of about 60 *d.* a year?—Yes.

3159. A charge of a penny and a third a week?—Yes; but you must remember that where you have on your supposition three infants in the family who cannot work, they will not consume up to the average, or anything like it. The average in the case of such a family would be much less.

3160. At what age do children usually begin to work in India?—They begin about eight years old.

3161. You have said that possibly there might 0.59.

be an increase to the salt duty, as I understand you, under a case of severe emergency, of 25 per cent.; you have never contemplated, you say, an increase of more than 5 per cent., but if the money were absolutely required, you think it would bear an increase of 25 per cent.?—Yes, I think it would, without seriously diminishing the consumption.

3162. But that represents the limit of the increase?—I am not prepared without experience to say that.

3163. One chief reason, as I understand your evidence, in justification of the salt duty is, that that there is no other article of general consumption on which we could impose a tax?—Yes, that is one.

3164. And has one never been suggested?—Yes, tobacco has been suggested, but that would be only partial.

3165. But the condition of the people of India is such that there is no other indirect tax that could be imposed that would tax them all?—No.

3166. Therefore if we required increased revenue, we could not in India impose an indirect tax upon any other article of general consumption?—Except tobacco.

3167. If an indirect tax should ever be imposed on tobacco, what would it raise, not a considerable amount?—I cannot pretend to say; all sorts of estimates have been made.

3168. That is the only article on which such an indirect tax could be imposed?—The only one I can think of.

3169. Mr. *Birley.*] I suppose as a general rule where wages are lowest, that is to say, in the remote districts of Bengal, there salt is dearest?—Yes.

3170. *Chairman.*] In regard to your remark that the objection to the levying of the salt duty by Government was rather a reflection of opinion in England, do you recollect that the objections to the system that prevailed in Bengal chiefly arose from Cheshire, and that it was very strongly urged on the Government that it should give up this monopoly, and that if it did so there would be a considerable reduction in the cost of salt, and that the Government in India very steadily resisted that, and said that it was one of those complaints that came from England and had no foundation, but the result would seem to show that the objections that arose in England were very well founded, and that everything that was predicted has happened, and in consequence of the change that was made there has been a reduction in the price of salt of 50 per cent.?—The Government for a long time resisted the abolition of the Government manufacturer upon various grounds; I think the chief ground, perhaps, was a ground, which of course now-a-days is not tenable, but which had a great deal to justify it; they felt that it would be a great injury to the local manufacturer.

3171. Then they looked upon it as a question of protection to the local manufacturer?—It was always a matter of indifference to the Government whether they got their duty upon the import of foreign salt, or by adding to it the cost price of the salt they made themselves. Speaking financially merely, they never had an interest as a Government in keeping up the manufacture; the only object they had in keeping up the manufacture was to give employment to the people on the coast, who were employed on it.

Sir
C. Beadon,
K.C.S.I.
—
2 May 1871.

3172. It never occurred in that case to the people of India to complain, although they were paying 50 per cent. more for their salt than they need do?—No, they were not paying 50 per cent. more for their salt than they need do, because they never could distinguish between the duty and the cost price; they were only paying some 5 per cent. more than they need do, and than they do now.

3173. I mean 50 per cent. more than the actual cost; they were paying that, but they did not discover it?—No, they were not likely to discover it.

3174. That would afford rather a strong argument for saying that the complaints made by intelligent people in this country are rather deserving of consideration, if they then resulted in the Government giving a reduction of 50 per cent. on a first necessary of life, as the people of Cheshire pointed out that they might do?—But the Government were always aware of that; I think that the Government doubted the ability of the people of Cheshire to supply salt to Bengal, and thought that if the home manufacture were discontinued there might be a dearth.

3175. That has not taken place?—No, it has not, but the commerce of India was not so great then as it is now.

3176. Can you tell me whether any of the Bengal salt passes into native states and is then consumed, that is, states that do not form part of the general Government of India or of Bengal?—Yes; I think probably a small quantity may go into Nepal.

3177. Is there any drawback allowed on what goes into those states?—None whatever.

3178. Do any native states send salt into Bengal, of any kind?—No, none.

3179. Then, in point of fact, you also tax the inhabitants of the native states to the amount of the duty?—Certainly, if they consume it.

3180. Mr. Dickinson.] Has Nepal any frontier duty?—Not that I know of.

3181. Mr. Lytleton.] Is the local manufacture recovering its former position?—To a small extent.

3182. You regard the foreign supply as the chief one for the future?—Yes; in 1868-69 there were 6,000,000 maunds imported by sea, and only 91,000 maunds made under excise.

3183. Mr. B. Denison.] You have said that with the exception of the excise on spirits and drugs, the salt tax, speaking generally, is really the only tax which the poorer British subjects in India pay?—Yes.

3184. As regards the hardship or the contrary of the salt tax under the native governments, there were all sorts of vexatious imposts which the natives were subject to?—Yes.

3185. Which have been all swept away?—Yes; there were taxes upon everything.

3186. So that in fact this salt tax does stand in the place of a great variety of vexatious imposts which the natives were subject to under former governments?—I am not sure that it is correct to say that it stands in their place, but whereas they did not pay such a heavy salt tax under the native governments, they paid instead all kinds of vexatious imposts.

3187. Chairman.] Will you explain one circumstance: seeing that the salt is manufactured so cheaply in Bombay that it can be imported to Calcutta and sold there, what is it that enables

the natives of Bengal to pay such a much higher duty on the salt than the natives of Bombay seem able to pay?—But my position is that they cannot; that the Bombay people ought to pay as much.

3188. You may remember that the Bombay people made a great outcry, and indeed a riot, when there was an increase of the duty on salt?—They showed an ignorant impatience of taxation.

3189. They were not ignorant of the incidence of the tax on themselves?—No.

3190. Do you see in the circumstances of the people of Bengal any peculiarity which enables them to bear it, while the people in Bombay cannot?—Certainly not. In reference to Bombay, I believe that the agricultural classes in Bombay are just as well off, if not better, than those in Bengal.

3191. Do you think it is due to the fact that the Bengal people live very much on rice, and that rice is very much cheaper as an article of food in Bengal than it is in Bombay?—I cannot say.

3192. Do you think that if you put the two items together, the principal food and salt at Bombay, and the rice and salt in Bengal, and compared the two, the Bengalee would still be better off?—I do not think so; the cost of the salt which a man eats with his food is so very small in proportion to the cost of the food itself, even when that food is of the cheapest, that I doubt whether the nature of the food would affect the quantity of the salt consumed.

3193. Then perhaps the discontent in Bombay might be attributed to the fact that the salt was used very much for curing fish, and therefore was an article for manufacture rather than for consumption?—I do not know to what extent it is used for that purpose.

3194. Passing now from salt, are you also very conversant with the arrangements of Government for raising the revenue from opium in Bengal?—Yes; I know just as much about it as I know about salt.

3195. Has the existing mode of raising the revenue from opium been in force for a very long time in Bengal?—Yes, almost ever since the commencement of our rule in Bengal.

3196. You know generally what has been the course of that production for a long series of years?—Yes.

3197. You know that the production of opium in Bengal has been gradually growing for a number of years?—Yes.

3198. Will you state, in the first instance, as the system has been the same, what is the system generally under which this revenue is collected, and the administration under which it is collected?—I will endeavour to be as brief as possible.

The Government have established two agencies, one at Patna and the other at Ghazepore, which are usually called the Behar agency and the Benares agency, the head-quarters of the one being at Patna, and of the other at Ghazepore; each agency is divided into sub-agencies, which may be either co-terminous with the ordinary administrative districts, or sometimes there are two, three, or four sub-agencies in one district. The Behar agency includes all the districts of the Province of Behar, and also a portion of Chota Nagpore; and the Benares agency includes the districts of the Benares division; part of the Allahabad division, and Oude. Under the

the sub-agents are native establishments, whose business it is to look after the cultivation.

3199. In what mode is the land then selected for cultivation?—When any ryot wishes to cultivate opium he goes to the sub-agent and asks to have his name registered, his land measured, and to get a cultivation license, and the usual advance. The sub-agent makes inquiries, ascertains that the man is really *bonâ fide* an owner of land which he proposes to cultivate with opium, has the land measured, and then makes the advance upon the security of the person himself to whom the advance is made and his fellow villagers. The advance is made shortly before the sowing season. The ryot then sows his land, and when the plant is above ground the land is then measured by one of the native establishments, and if the ryot has sown all that he engaged to sow, he gets a second advance; if he has not sown so much, he gets something less in proportion, or if more he gets a little more. There is a sort of rough settlement at the second advance. Nothing further takes place till the crop is ripe for gathering; and when the ryot has gathered the crop he collects it in vessels and takes it to the sub-agent's office; there he delivers it to the sub-agent as the agent of the Government, and receives the full price for it, subject to further adjustment, when the opium has been weighed and tested and examined at the agent's factory. The opium is then collected at the sub-agency and forwarded to the factory; there it is exposed for a considerable time in large masonry tanks; it is reduced to a uniform consistency, and made fit for the market, some for home consumption and some for sale in Calcutta for exportation, the greater quantity for exportation. It is then packed in cases and sent to Calcutta, and in Calcutta it is sold by auction at periodical sales and exported by merchants for consumption abroad.

3200. What is the relation of the ryot to the landlord; are all the cultivators under zemindars?—There may be a few who cultivate their own, what we may call freeholds, but the great majority of them are in the condition of ryots, who pay rent to a zemindar.

3201. With that the Government has no concern?—Nothing whatever. The Government does not ask what right a man has to his land; all they look to is the fact of occupancy and the fact of the man being able to fulfil his engagements.

3202. But supposing that he does not pay his rent to the zemindar, what becomes of the crop then?—There are some special regulations which prevent the landlord from touching the opium crop; it is exempt from the ordinary law of distress.

3203. So that the growing crop is, as it were, mortgaged to the Government for the advances in the first instance?—Yes; instead of being mortgaged to the landlord it is mortgaged to the Government.

3204. And they are entitled to be paid before anyone else can be paid?—Yes.

3205. Is there any regulation by which the Government limit the extent of the land so cultivated, or do they always accede to every request?—It is limited according to the financial needs of the Government; it is limited entirely upon Imperial considerations. The Government of India, theoretically at least, if not practically, decide how much opium they will bring to

0.59.

market; and of course upon that depends the quantity of land that they will put under cultivation and make advances for.

3206. The produce per acre being well known by long experience, the applications that are acceded to are limited by the estimate of the quantity required?—Yes; on an average.

3207. On an average of the season?—On an average of many seasons.

3208. Are the districts that are so cultivated with opium, in large blocks close together, or are they much scattered?—The villages are very much scattered; the cultivation is scattered all over the districts in which it prevails; but in particular villages it is generally all those lands immediately contiguous to the homesteads as being generally higher, less liable to inundations, and more easily irrigated, and also more cheaply and easily manured.

3209. Is it always necessary to irrigate the crops to bring it through?—Yes, except in some of the most northern districts.

3210. Are great precautions taken to prevent any person cultivating the land with opium without a license?—It is absolutely prohibited.

3211. But is there great supervision required to prevent people from cultivating without a license?—There is an establishment of native officers employed under the sub-agent whose business it is to go round the district, and measure the opium lands in the different villages.

3212. It is a crop that is very easily distinguished, and it takes a long time to mature, does it not, till the opium is gathered?—Yes, it is a crop that takes a great deal of labour and a great deal of preparation, so that the lands on which the poppy is sown are identifiable from the first sowing; the cultivation cannot possibly be concealed.

3213. So that you have no reason to suppose that there is any illicit cultivation?—There is no illicit cultivation at all.

3214. Do you suppose there is much room for fraud being practised on the Government in the collection of the opium itself?—I think that some small quantity of opium, not much, finds its way from the hands of the producers into the hands of consumers, and perhaps the producers consume some of it themselves.

3215. I suppose they always keep some for their own consumption; they are not all opium eaters, but such as are do not hesitate to retain some for their own use?—It is extremely difficult, if not impossible, to find that out, but on the whole very little is diverted from the Government, and the Government only pays, of course, for what it receives.

3216. Do you think that to any considerable extent, or to a small extent, the opium is manufactured privately from the growth, and sold privately?—The manufacture is entirely in the hands of the people who grow it.

3217. I mean whether they manufacture it to any considerable extent for purposes of sale?—No, to no considerable extent. There is a certain amount of smuggling, but it is insignificant compared with the whole quantity.

3218. Are there many detections of smuggling in the course of the year?—Yes; in the producing districts the facilities for the abstraction of opium made by the ryots themselves are so great that the Government hardly attempts to prevent it; what they do is to sell opium for consumption in those districts at a price a little above the

prime cost, and they encourage the people instead of consuming the opium which they have cultivated, to send all that opium in to the Government for sale, and to consume this opium, which is at their disposal at a fixed price.

3219. Then that which the Government sell is properly manufactured for keeping and for consumption?—Yes, a part of what is called the Abkarry opium.

3220. Is there any reason to suppose that that opium is all consumed in the district, and none of it sent away for export?—The quantity sold by the Government in the producing districts is very small indeed.

3221. Is the money that is advanced always repaid at the end of the year, or have the Government many losses in ultimately adjusting with the cultivators?—The advances in the two agencies are upwards of 2,000,000 £ sterling a year; and I do not know what may have been the case the last two or three years; but when I was in Bengal the remissions amounted to some 200 rupees or 300 rupees, so popular is the cultivation and so punctual are the ryots in discharging their obligations.

3222. And is that the case throughout all seasons, good and bad?—There may be some difference, but generally speaking the ryots have no difficulty in fulfilling their engagements.

3223. So that on the whole the revenue is very surely collected from this branch?—Very surely collected.

3224. And without loss?—Yes.

3225. Are you aware that under this system the number of chests increased from, in 1829-30, 7,565 chests, to, in 1853-54, 53,321 chests?—Yes.

3226. In the first period the cost per chest to the Government was 291 rupees; and in the second period the cost per chest was 281 rupees?—Yes.

3227. And the gross revenue was 1,250,000 £ in the first period, and in the other period 3,920,000 £?—Yes.

3228. And the net revenue was 1,030,000 £ in the first period, and in the other period 2,420,000 £?—Yes.

3229. There was a steady increase from the first period down to the last?—Yes.

3230. Did any alteration take place in the size of the chests?—I do not think there has been any alteration from the earliest times.

3231. As this production increased I think the price steadily went down. The price in 1829 was 165 £ a chest, and in 1853 it had diminished down to 73 £ a chest?—Yes.

3232. Therefore, as the quantity increased, so did the price diminish to one-half?—Yes.

3233. You are aware that, from 1853 downwards, to 1858-59, there was a steady decrease, or rather a very rapid decrease, in the production?—Yes.

3234. And that, in 1858-59, it reached the minimum production again of 21,357 chests?—Yes.

3235. But that the price, however, rose to 163 £ a chest, and that the gross revenue was 4,450,000 £, and the net revenue was 3,600,000 £?—Yes.

3236. Can you explain to the Committee what were the circumstances under which the production of the opium diminished and the price rose?—Yes. Consequent upon that great increase of production and reduction in price, some diminution in the price paid to the cultivators

was determined upon. I cannot recollect precisely what it was, but I think very likely it may be stated in that return before you. There was some diminution of price paid to the cultivator, so much a seer being paid to the cultivators for their opium. That of itself restricted the cultivation, and the Government being themselves anxious to restrict the cultivation gave up some of the outlying sub-agencies. There was an agency at Futtchgur, in the North West Provinces, and an agency at Oude, and at Allahabad. I think all those three agencies were given up. There was no agency at Poorneah, in Bengal; that was given up; and an agency at Chota-Nagpore was also given up. The result of these measures, together with the general growth in the price of agricultural produce which followed the Russian war, combined to reduce the cultivation until it fell to such an extent that, in 1858-59, the produce was only a little over 21,000 chests.

3237. Then previous to these measures, the increase which I have described was due to the gradual development of the cultivation to meet the demand at Calcutta for opium?—Yes. It was thought in those days that the more opium you made the more revenue you would get, but the result of the year 1853 showed the Government that there was a point beyond which it was not profitable to go, and that if you exceeded a certain quantity of opium, the price in China would fall so low that it would affect your net revenue.

3238. The revenue in that view being, of course, the difference between the sum that you pay and what you can get for it in Calcutta?—Yes. The cost of producing the opium is pretty nearly constant. Then the difference between the cost and what you realise in Calcutta is, in fact, your duty, or your profit, or whatever you like to call it; but it depends, of course, upon the prices in China; and if you overstock the market in China by suddenly increasing the provision, as they did in those days, from 30,000 to 50,000 chests, there will inevitably be a sudden depreciation.

3239. Do the public of Calcutta know what is the out-turn of the season before the sales for the year begin?—That is a very important question which I should like to answer at some length. Up to 1865 the Government always brought to sale in each year the quantity produced in that year, and it was always advertised to the public some time before the sales began; but it was impossible for the public or the Government or any body else to know a year beforehand how many chests there would be for sale the year after; that could not be known until the whole crop was gathered and manufactured into marketable opium and packed in chests; and when the Government knew what number of chests it would have to bring forward for sale in the following year, it notified the same to the public, and from that notification no deviation was ever made. Well, just before 1865 a similar collapse had taken place to that which was just now described as having taken place in 1853. When the Government discovered that in 1858 the production had gone down to 21,000 chests, and was threatened to go down still further, it became alarmed and saw the necessity of doing something. It then saw that although the price in 1859-60 increased to 2,000 rupees a chest, still the larger amount of profit got upon the smaller number of chests

price was not sufficient to compensate them for the more moderate profit which they lost upon the larger number of chests; they therefore resolved to push the cultivation by every possible means and restore it to what it was before the fall took place; accordingly in 1860-61 the price was raised to 4 rupees a seer, a seer being two pounds, that is, 4s. a pound; and in the following year it was raised to 5s. a pound.

3240. You mean the price paid to the cultivator?—Yes; under the operation of that great stimulus, raising the price from Rs. 3. 8. a seer to five rupees a seer, the cultivation increased rapidly, and the produce rose to 29,000 chests in 1860-61, to 39,000 chests in 1861-62, to 49,000 chests in 1862-63, and to 64,000 chests in 1863-64. Then it became apparent (and it devolved upon me at the time, being Lieutenant Governor of Bengal, to bring the matter to the notice of the Government) that some change was necessary. I may first mention that this enormous increase of produce was followed by a corresponding reduction in the price, and a loss in the revenue, and it was then pointed out to the Government of India that in order to remove one element, and the most important element, of uncertainty from the opium revenue, it was absolutely necessary that they should bring forward every year for sale, not the quantity of opium that happened to be grown in that year, but a fixed quantity which should not vary from year to year, and which should be supplemented by a reserve of opium, a certain number of chests of opium, so that in case of a short crop the deficiency might be supplied, and the figure at which it was proposed to fix the sale was put at 48,000 chests; that, after inquiry, was considered to be about the quantity which the China market would take off without, on the one hand, reducing the price so far as to affect the revenue derived by the Government from the export duty upon the Bombay opium; and, on the other hand, it was considered that the price would not be so high as to encourage the importation into China of opium from other countries, or the manufacture of home-grown opium in China itself. And it was also pretty clearly shown that according to the data then existing 1,200 rupees a chest in Calcutta, which was about the price that might be expected on a provision of 48,000 chests, was really that point at which the net revenue would stand at the highest; it would not be affected injuriously by the lowness of price in China on the one hand, nor would the Government lose on the other by the loss of Bombay opium in consequence of its being less than 1,200 rupees.

3241. Then from that time it has been generally known what is the quantity to be sold?—Yes; that took place in 1865; the matter has been undergoing discussion since, but that has to a certain extent been acted upon, and in 1869 the arrangement was formally sanctioned by the Secretary of State for India.

3242. Have you got the opium account for 1868-69?—No, I have only got the local accounts of the agencies for 1869-70; the general account has not been sent home.

3243. Can you give the result of the operations for 1868-69?—Only in the price. In 1868-69 the total gross receipts for opium in Bengal were 6,822,255 L., and the total charges were 1,717,746 L., the net revenue being 5,104,509 L.

3244. The sale price in that year in Calcutta, I think, was 137 L. a chest?—Yes.

3245. Therefore it would seem that the arrangement which you have mentioned was very successful in that year?—I think so.

3246. Has that, as far as you know, been continued up to the present time?—I think not; I think the Government have deviated from it this year.

3247. Do you know in what respect?—They have ordered the sale of 52,000 chests instead of 48,000 for the year 1871.

3248. Have you the accounts for the year 1869-70 of the Bengal opium?—No; it is not available.

3249. It would seem from the accounts presented for 1869-70 that the gross receipts for opium in Bengal were 5,594,000, and that the charges of collection and cultivation were 1,317,000 L., and the net receipts were 3,776,000 L. The charges paid for a chest of opium would seem to have been steadily rising since the period that you have mentioned of the depression of the cultivation?—No. In 1865 it was again reduced from 5 rupees to Rs. 4. 8. At the same time that it was determined to sell 48,000 chests every year the Government again reduced the price to Rs. 4. 8. the seer.

3250. And it has remained at that?—It has remained at that ever since, and the cultivation now remains steady.

3251. To what do you ascribe the great reduction in the opium revenue for 1869-70 as compared with 1868-69?—There are two reasons. One is that there was an unexpected fall in the price of opium in China, and I have not yet heard that anybody has been able to give a satisfactory account of the cause of that, but that the price did fall in China, and consequently in Calcutta, there is no doubt. It was supposed to have arisen from a large extension of cultivation in China, but that seems to be contradicted by the fact that this year prices have resumed their former figure.

3252. It did not arise from any apprehension that the Government intended to increase its produce in the ensuing year?—I do not think so, because they certainly had no such intention then.

3253. Is it your opinion that if the system which you have lastly described is maintained, the revenue from the Bengal opium would be maintained at the existing rate?—I think that the opium revenue must always depend upon the prices in China, and they must depend in a great measure upon circumstances altogether beyond the control of the Government; but I think it is in the power of the Government to remove one element of uncertainty in the opium revenue, and that is by offering for sale as nearly as possible the same quantity every year.

3254. Do the Government offer it at an upset price?—Yes, they do, nominally.

3255. I presume ultimately they must sell it for what it will fetch?—The contingency of its being sold at the upset price has never happened; the upset price is 400 rupees a chest, but the first bid is always double that.

3256. Then it is practically not selling it with any immediate prospect of revenue?—No; the reason why the 400 rupees is put upon it is that it just covers the expense of bringing it to Calcutta.

3257. Therefore, practically, they get exactly the

Sir
C. Beadon,
K.C.S.I.

2 May 1871

Sir the revenue that the public are prepared to give?
C. Beadon. —Yes.
K.C.S.I.
 2 May 1871. purpose of obtaining revenue?—Such a thing has never been done. •

3259. Nor have chests been held back, except for the purpose that you have mentioned of equalising the amount exported?—No.

3260. The stock which they now keep would be merely for the purpose of keeping the quantity sold one year with another equal?—For no other reason.

3261. But do you think that the plan which you have proposed offers a temptation to the Government of India to increase the quantity it produces, even if they think they can keep up the price?—I think the interest of the Government, the public interests, will lead the Government to adhere to that rule; a desire to get the largest amount of revenue.

3262. But might not an unskilful speculator think that he might possibly increase the 48,000 chests and still keep up the price?—Well, I do not pretend to know the reason, but that has been done this year; the amount has been raised from 48,000 to 52,000 chests.

3263. But do you know of any legitimate grounds of speculation for raising it to that extent?—No, I do not. I do not in the least know the reasons.

3264. Did the Government take any measures to inform themselves of the possible state of affairs in China to regulate the quantity?—It may possibly have arisen from some information which the Government obtained as to the price of opium in China, and the extension of cultivation there; but I have no certain knowledge on that point.

3265. *Mr. Baring.* I do not quite understand the grounds upon which you think the best plan to follow is only to keep a certain amount every year?—Simply this, that it removes one element of uncertainty in the price of opium, and consequently in the amount of revenue which the Government can derive from it year by year. Half the complaints that we hear about Indian budgets and Indian finance arise from the impossibility of forecasting what the result of the opium revenue will be; and with a view to prevent that, and to give more stability to the finances in the matter of opium, it seems to me that it is a great object on the part of the Government to remove that one element of uncertainty, which is within their own power, and to bring forward every year as nearly as possible the same quantity of opium, merely providing for a gradual increase so as to meet the natural expansion of the trade.

3266. But I understood you to say that the price depended very much upon the demand in China, which was uncertain?—Yes; but one reason that makes the demand uncertain in China is the varying quantity of opium brought into the market by the Government in Calcutta, because if 60,000 chests have to be taken to China instead of 40,000, and have also to be sold to the Chinese, the Chinese of course will not give the same amount per chest for those 60,000, or anything like it, that they would give per chest for the 40,000 chests.

3267. But would not the power of consumption in China vary?—The power of consumption varies, but not at the same price; it affects the

price. The whole of the opium is consumed, but people will not pay so much for it.

3268. But I should have thought that supposing the Chinese were to be very prosperous, and to be able to consume more opium one year than another, if the supply is regulated according to that demand, that would be the proper method of meeting it?—That is exactly the object which this arrangement had in view, to ascertain what was the demand, what amount could be taken off at a fair price, that is to say, what was considered a fair price; that price which would produce the largest amount of net revenue, and what the demand in China would be at that rate, and then to satisfy that demand in a regular way; because naturally the demand would not vary from year to year unless it was greatly stimulated by a reduction of price.

3269. But to India it would be the same, would it not, if they produced more and sold it at a lower price, or if they produced less and sold it at a price in proportion?—Well, it is found by experience that after the year's provision exceeds a certain point the Government lose more by reduction of price than they gain by the increase in quality of the article sold; that is a matter of experience.

3270. Is there no other opium that comes into competition with this in China?—Yes, there is a very considerable growth, and I believe an increasing growth of opium in China itself. I believe it is strictly prohibited by edicts from the emperor, but that those edicts are very much disregarded; they are, in fact, very little better than waste paper; and from all the accounts that we have, the production of opium in China is increasing, and has become very considerable.

3271. Turkey opium is not consumed now to any extent, I think, in China?—I have not heard of any Turkey opium being sent now to China, but there is a considerable export of Persian opium into China.

3272. If India limits its production, will not that give a stimulus to the production of China?—That is what I have said, that the Government must keep down its prices to a point which will not encourage either the growth of opium in China, or the importation of opium from foreign countries. But you see there is another consideration that in this matter the Government has to take hold of; they impose upon the Bombay opium a duty of 600 rupees a chest, and according to the accounts which we have, it costs between 500 and 600 rupees to bring the Bombay opium to market at Bombay; and therefore if our price in Bengal is very much less than 1,200 rupees a chest, we cannot continue to levy a duty of 600 rupees a chest upon the Bombay opium. Therefore, if it is shown that 1,200 rupees a chest is too high a price to be paid for Bengal opium, and that with such a price it will be under-sold in China by foreign opium, or by home grown opium, then the first step that the Government must take is to take 100 or 200 rupees, or whatever it may be off the Bombay duty, then it can afford to sell the Bengal opium at a lower price, but, of course, with some loss of revenue.

3273. The result is that you think the present system the safest and most productive for the purposes of the Government?—You mean the system of regulating sales. I think so. Perhaps I naturally think so, because it is my own.

3274. *Chairman.*

3274. *Chairman.*] Can you tell us with reference to the effect of the sales in China on the prices in Bengal, when is the first sale for the season in Calcutta, and when is the first re-sale of the season in China?—The first sale of the season in Bengal is in January.

3275. When is the first re-sale of the opium in China which fixes the price of the opium in China?—Within a very few weeks; three weeks or a month.

3276. *Mr. Baring.*] That is done by private persons?—Entirely. But the people in China know how much opium the Government are going to bring into the market long before the first sale takes place.

3277. *Chairman.*] When is the second sale in Bengal?—In February. There is one every month. Most of the sales which are made in Calcutta are made on commission, under orders from China.

3278. They are governed by the price which has been established in the beginning of the season, in China, on the re-sales?—Yes, chiefly so, I imagine.

3279. And on the price immediately before, in fact, in anticipation of the sales?—Yes.

3280. Therefore the price in China has an immediate action on the sales in Calcutta?—Yes, it has; but the prices are influenced by other things too.

3281. What other things?—Well, it is largely used as a medium of exchange. It is the only way by which merchants can pay for their tea; they must pay for their tea and silk in Indian opium; so that exchanges affect the value of opium in Calcutta.

3282. That is to say, the rate of exchange is taken into account in fixing the relative price in Calcutta and China?—Yes, very much. I have known instances of prices in Calcutta being higher than the nominal prices in China, and leaving no margin for profit, one of the chief reasons of that being that the opium is used as a means of remittance, and that more can be made in that way than by taking bills. Then, too, the holders of Bombay opium, in Bombay, find it worth their while to bid up the opium, in Calcutta, to a price above its real value, in order to maintain the price of stocks at Bombay, particularly now that the two are connected by telegraph; the prices in Bombay and Bengal hang upon one another.

3283. The quantity sold at any monthly sale being such that individuals can materially influence the price by speculative biddings?—Yes.

3284. And are there cases where they have greatly enhanced or affected the price by purely speculative biddings?—Yes; it is one of those operations from which the Government always derives immediate advantage, that is they never bid below the value, but they very often bid above it.

3285. It is the great staple in which the natives in the commercial classes of India gratify their appetite for gambling, is it not?—Yes, to a very large extent.

3286. And that to some extent influences the price?—Yes.

3287. *Mr. Cave.*] Do they buy opium in anticipation of the sale without knowing what the quantity offered will be?—No, they never begin their speculative biddings until the amount to be sold is made known, and the Government makes known the quantity to be sold months before the

first sale takes place. For instance the announcement of the quantity to be sold in 1871 was made as far back as April 1870.

3288. Then there is no undertaking by speculators to deliver a certain quantity which they may not be able to deliver by a certain time?—A man will undertake in the month of June to deliver so many chests in January; whether he gets them or not he pays the difference.

3289. That is quite independent of the Government?—Yes.

3290. Do you say that the opium is used as a means of barter in China?—No; simply as a means of remittance to cover bills.

3291. For the payment of tea principally?—Yes.

3292. *Sir C. Wingfield.*] Can you state what the total value of the opium sold in the districts for what is called district consumption is?—Yes, I can. I will take the year 1868-69; that is the latest I have; I cannot give you the number of chests, but I can tell you what the value of it is. The proceeds from the sale of Abkari opium in 1868-69 was 31 lacs and 25,000 rupees, and the cost of the opium and contingencies, and all other charges upon it, were 10 lacs and 25,000 rupees; so that the Government made a profit upon the sale of that Abkari opium of 21 lacs of rupees.

3293. But after all 30 lacs, 300,000 £, represents the value of that proportion of the opium that is consumed by the people of India?—Yes.

3294. The rest all comes from a foreign people?—All the rest of the revenue comes entirely from the Chinese; it is paid by them.

3295. Is it never sold in smaller portions than a chest for exportation, is it?—No; in the districts it is sold in minute quantities.

3296. Do you not think that that is a very remarkable fact; it shows at all events that the Government system and manner of dealing with opium cannot be said to stimulate the consumption of a deleterious drug in India?—Yes; I do not know that it was ever so asserted.

3297. It has been repeatedly said in this country that it is demoralising to the natives of India?—That has been said as to China.

3298. I thought it was always a great set-off to the system that it had precisely the opposite effect, and that it diminished the use of the drug in India?—So it does, in so far as the price the Government puts upon the opium can do so.

3299. And so far that the free cultivation is not permitted; if the free cultivation were permitted it would be impossible then to prevent private sale in the country?—Yes.

3300. Do you recollect that that is what precisely did happen on the annexation of Oude. We found the opium grown in the country; the Government would not interfere with the people growing the opium, but they said that they must take it to certain contractors who held a contract from the Government, and sell it to them and them only; but the contractors found that it was utterly impossible to enforce this condition, and the opium was sold in the country. You may not recollect that, but cannot you imagine that it would be so?—Yes.

3301-2. You said, did you not, that the cost to the Government is 400 rupees a chest to manufacture it and bring it down to Calcutta?—It varies; it is about that.

3303. But I think that I have seen it put at about

Sir
C. Beacon,
K.C.S.I.

2 May 1871

Sir
C Beadon,
K.C.S.I.
May 1871.

about 450 rupees lately?—No, it is not so high now as when the price paid to the cultivator was five rupees; the price paid to the cultivator now is only Rs. 4. 8., and therefore the cost per chest has decreased also.

3304. This system by which Government makes these advances leads to a great deal of money being circulated in a district, does it not?—Certainly.

3305. And that must be very conducive to the prosperity of the district?—Yes, it is.

3306. And have you heard that in the settlements in the North Western Provinces, in some districts, the amount of land revenue that you could assess has been very materially influenced by the prevalence of the opium cultivation in the district?—Yes.

3307. Have you heard it said that the great rise in wealth and prosperity, and the increase in the assessment of the district of Goruckpore has been very mainly owing to the great cultivation of opium there, and the large sum always lying out in advances?—Yes; and that is the case with all the districts in which opium is grown.

3308. And in fact it is possible that if the cultivation is put a stop to in some of those districts where it is now being carried on to a very great extent, the effect would be perceptible in the collection of the land revenue?—Undoubtedly it would; the advances in the Behar division on account of opium are considerably in excess of the land revenue of the division.

3309. And that money is practically lying out without interest; I mean that the people are getting the advantage of all that money circulating in the district without interest?—Yes; I may add for the information of the Committee, that practically it has come to this, that the payment of the land revenue depends at certain seasons of the year upon the opium advances, and that until the opium advances are made, instalments of revenue cannot be paid by the Treasury. And that was brought to light in a very remarkable instance during the mutiny in the district of Goruckpore. The collector of Goruckpore received an order from the Government of India, at the instigation of the military authorities, not on any account to pay any money out of his treasury, except on the requisition of the military officer commanding the troops in the district; all the money he had in his treasury was to be reserved for military

purposes. Immediately after the opium agent applied to the collector for the usual money for advances. The collector was obliged to reply, that he was prohibited by the order of the Government from giving any money for the opium advances. The consequence was, that the opium advances could not be made. Thereupon the people who were to receive these advances, and who were themselves the payers of revenue to Government, went to the collector's office and said that they could not pay their land revenue. So that the whole thing went in a circle; and the collector could not receive his land revenue to pay his troops.

3310. In what year was that circumstance that you have referred to, because I was there in 1858 myself?—It was somewhere about that time that I heard the story told; it may have been Azimgurgh; I am not quite sure as to whether it was Goruckpore or Azimgurgh; it was one of those districts.

3311. Therefore we may safely say that the effect of putting a stop to the opium cultivation would be felt in the collection of the land revenue?—Yes.

3312. *Chairman.* Can you state what is the value of the produce per acre of opium cultivation?—I can tell you what the average production per beegah is. The beegahs vary so much, they vary in the different parts of the agency so much that you cannot make any correct calculation; but in a very rough way you may say that a beegah is three-fifths of an acre. In Bengal three beegahs go to an acre; in Behar and Benares it is about a beegah and two-fifths that go to an acre; in 1858-59 the produce was three and a-half seers per beegah; in 1859-60 it was three and one-tenth seers; in 1860-61 it was five and a-half seers; in 1861-62 it was four and one-tenth seers; in 1862-63 it was five seers; in 1863-64 it was five and one-tenth seers (when I say a tenth, I mean 5 decimal point 1, and something beyond that); in 1864-65 it was four and four-fifths seers; and in 1865-66 it was five and one-tenth seers.

3313. And the cultivators get Rs. 4. 8. a seer?—Yes; and you may say that on a long series of years the average is about four and a-half seers a beegah, so that if you multiplied the seers by Rs. 4. 8. that would give you the amount per beegah.

Mr. J. B. Smith.
Sir David Wedderburn.
Sir Charles Wingfield.

THE RIGHT HONOURABLE ACTON SMEE AYRTON, IN THE CHAIR.

Sir CECIL BEADON, K.C.S.I., re-called; and further Examined.

3314. Sir C. Wingfield.] You have, no doubt, considered the question which has been so often discussed in India, whether an export duty should be substituted for the present Bengal system of the cultivation of opium on account of Government, and sale by auction?—Yes.

3315. What is your opinion on that question in regard to the effects on the revenue —If you impose the same amount of duty upon Bengal opium that you impose upon Bombay opium, and if you could realise it in Bengal with the same facility with which it is realised at Bombay, the financial effect would be to relinquish the difference between that amount of duty and the profit which is now obtained by the sale of the opium, and which I suppose, roughly, may be put at about 200 or 250 rupees a chest.

3316. But that is assuming that the same quantity of opium would be grown as is grown now?—Yes, assuming that also.

3317. But do you think that the cultivation would fall off greatly if the present system of growing it under advances were stopped?—Certainly it would, at first.

3318. You are aware that in regard to Mulwa, where nearly all the opium brought to Bombay on which an export duty is levied is grown, the advances to the cultivators are made by Bombay merchants?—So I understand.

3319. Do you think that the merchants of Calcutta would take the place of the Bombay merchants in regard to the opium in Bengal?—I should think it very probable that they might: the profit would be quite sufficient to tempt persons with capital to enter into the trade.

3320. At first probably there would be a falling off in production if the present system were discontinued?—I think it most probable that there would be. It would take some time before capitalists could be prepared to enter upon such very large transactions as those involved in the manufacture of from 40,000 to 50,000 chests of opium.

3321. The experiment then would be a rather hazardous one?—I think it would, as regards the revenue.

3322. I dare say you have read a report of the 0.59.

delegates of Shanghai Chamber of Commerce, who accompanied Consul Swinhoe into the interior of China?—Yes.

3323. You are aware that they report a very great extension of opium cultivation in China? 5 May 1871
—Yes.

3324. They said that there was apparently not now even a nominal prohibition, for the opium was freely carried about, and paid transit duties just like any other article in the interior?—That I believe is the purport of their report.

3325. And they agree, I think, that the extension of the cultivation of the native opium must lower the prices of the imported?—Yes, I think they said that.

3326. But they also said that the Indian drug was very much better, and was consumed by the wealthier classes?—I think they said that the Indian opium as a rule was about 50 per cent. better than the China opium.

3327. Could you form any opinion in your own mind as to the degree in which the prices of Indian opium are likely to be affected by the increased cultivation in China?—I can only form the same general opinion that any one else can form upon those data; that if the cultivation of the poppy extends in China it will naturally have the effect of reducing the price of opium in India.

3328. Last year, in the estimates for 1870-71, they calculated on 97 £ a chest, but the opium realised 112 £ a chest, so that their anticipation of a falling off were not realised. That was stated by the Financial Member of the Council in India. Could you assign any cause for that?—The only explanation that I can give of it is that the extension of the cultivation in China is perhaps not quite so great as was supposed.

3329. Mr. Fawcett.] I understand you to say that opium is grown in India simply for purposes of revenue; no moral considerations at all influence the Government?—The Government only regard opium as a means of obtaining revenue.

3330. That if, for instance, they thought they could obtain more revenue by doubling the cultivation of opium in India, they would do so, and would not be deterred from adopting such a course

Sir
C. Beadon,
K.C.S.I.

Sir
C. Beadon,
K.C.B.,
—
5 May 1871.

course by any considerations as to the deleterious effect which opium might produce on the people to whom it was sold?—Probably not.

3331. I believe the opium revenue has realized some years as much as 9,000,000 £, has it not?—From the whole of India nearly 9,000,000 £, I think, one year.

3332. What is the average *ad valorem* duty on opium in Bengal, taking the average price, and comparing it with the duty?—I cannot tell you the average exactly; but perhaps the best plan would be to assume a price, say 1,100 rupees a chest, or 110 £, and then the price of a chest of opium, including the cost of manufacture, and the expense of all establishments, is something under 400 rupees a chest; if you put it at 400 the proportion is just 400 to 1,100, and the duty, or profit, is seven-elevenths, on that supposition.

3333. So that you may say that the opium duty on the average, according to those figures, is about an *ad valorem* duty of 180 per cent.?—Yes.

3334. In your last evidence you stated that the cultivation of opium in China was restricted by an edict of the Emperor?—So I have gathered from the official correspondence.

3335. Of course there is no security whatever that that edict might not any day be rescinded?—None that I know of; it is in the pleasure of the Chinese Government.

3336. Over whom, of course, we have no influence?—None whatever.

3337. Suppose any day it was rescinded, of course, that would enormously increase the cultivation of opium in China?—It would very likely have that effect; except for this reason, that according to those accounts the cultivation goes on increasing in spite of the edict.

3338. But still, no doubt from your previous evidence the edict has some influence; if the trade were perfectly free there would be more cultivation, I presume?—I have no knowledge on that point, except what I have derived from reading the reports.

3339. A paper to which reference has been made which you said you had read, estimated the difference in the quality of the Chinese and Indian opium at 50 per cent.?—Yes.

3340. Therefore, if there was perfect free trade or unrestricted cultivation of opium in China, it would be absolutely impossible, owing to competition, to maintain anything like the present duty of 180 per cent. upon Indian opium?—I do not see that.

3341. Does it not follow as a self-evident proposition?—Not if the quality of the India opium is 50 per cent. better than the China.

3342. But if the India opium is only 50 per cent. better, that represents the maximum duty which you could levy, does it not?—Yes; supposing the cultivation were perfectly free, and the demand sufficiently supplied.

3343. Therefore, admitting the truth of the fact that the edict may any day be rescinded in China, and the cultivation become perfectly unrestricted, you have the fact that you may have any day an order to sell your India opium to reduce the duty to one-third of its present amount?—I think it quite possible; in fact, it must be so.

3344. Then, besides that very serious prospect, am I not correct in stating (I believe you stated it) that the cultivation of opium in Persia is very

much increasing?—So it appears from the official reports.

3345. Can you give any figures to show that?—Yes; the last report states that the production is 4,000 chests.

3346. And how rapidly has it increased?—It is quite of recent growth.

3347. So that you may say that the export of opium from Persia to China is steadily increasing?—I think it is.

3348. So that not only have we the prospect before us of China becoming a most formidable competitor, so formidable as to render it necessary for us to reduce our duty to one-third of the present amount, but we also have another serious competitor in Persia?—Yes; but I suppose it will not be long before the Persian Government see the policy of putting an export duty on their opium.

3349. Do you know the relative advantages that Persia has for the cultivation of opium compared with India?—No, I have no knowledge of that; I have never seen anything bearing on that.

3350. They sell it now at a cheaper rate than we can sell ours, do they not?—On that point I can give you no information.

3351. Can you give us any information as to the relative quality of the Persian opium compared with the Indian?—No, I have never seen any analysis of the Persian opium.

3352. Then considering this opium question as a financial question it comes to this, that we raise 9,000,000 £ in sales of a very deleterious drug to another people, and that that revenue is a most critical and uncertain one; it may be, according to your own statement, at any day reduced by two-thirds?—We only realise half that amount from the manufacture and sale of opium; the rest is realised by all Indian opium exported from Bombay.

3353. That comes exactly to the same thing, does it not; it estimates the whole amount of revenue?—Quite so; only in putting your question you seemed to imply that the whole was derived from the manufacture and sale of the drug by Government, as I understood you.

3354. Then I will put the question differently; the whole revenue is 9,000,000 £, therefore there is the prospect at any time of India suddenly finding itself deprived of 6,000,000 £ of its revenue?—It is quite possible that such a thing may happen; and no doubt opium is admitted and known to be a precarious source of revenue to a certain extent; but I think it will be a long time before it is likely to be seriously affected.

3355. But still, looking upon it simply as a question of prudence, it is not a source of revenue which is a certain source of revenue like the land revenue or the salt duty, for instance?—No, certainly not.

3356. The year when 9,000,000 £ was raised by the opium revenue in India, I believe was a year when there was a very serious deficit, was there not, in the Indian finance; it was two years ago, was it not?—It was in 1867-68.

3357. *Chairman.*] For the year ending March 1868, the gross revenue for opium was 8,923,000 £?—Yes.

3358. *Mr. Fawcett.*] In spite of obtaining this very large revenue from this uncertain source, in that year there was a very serious deficit, was there not, in finance?—I do not think that there was a deficit on the ordinary expenditure. There

as, if you include the extraordinary expenditure on Public Works.

3359. But still that year you were borrowing?—For reproductive works.

3360. Then have you ever contemplated (of course you have had to consider these financial questions) whether there would be any means of supplying this large deficiency which may any day occur?—No doubt I have considered it from time to time, but the question never assumed a practical shape.

3361. But do not you think that it has already assumed a practical shape when Indian finances are in this position, that in a majority of years you have very serious deficits, and you are constantly borrowing; and at the same time, in addition to your deficit, and in addition to your borrowing, you are obtaining a revenue from a speculative source which may any day be very seriously diminished?—The only practical form in which the question has arisen for consideration is this: Shall we sacrifice the whole or any portion of the opium duty? And it seems to me that the present state of the Indian finances is such as to prevent us from giving any answer but one to that question, that we must not give up any of the opium revenue; we cannot afford to do so.

3362. But that is not at all my point. It is not a question whether we shall voluntarily give up a portion of this revenue; that is not the point at all to which I wish to direct your attention. What I want to direct your attention to is not the voluntary surrender of this revenue, but the possible, if not the probable, compulsory surrender of it, owing to circumstances to which you have yourself alluded, and which you say exist?—When that arises, the difficulty must be met either by reducing expenditure or by the imposition of other taxes.

3363. You say it must be met by reducing expenditure or by imposing other taxes. I will begin with the first point first; how could you reduce expenditure?—Well, that is a very large question, quite beyond the scope of the opium question.

3364. But still it is a question, as I venture to submit, intimately connected with this opium question; because the point which I wish particularly to bring out is this: that you are living in India above your means, and at the same time that you are living above your means you are obtaining a portion of your income from an extremely uncertain and speculative source, which may any day be seriously diminished. You say that, if it did diminish seriously, you would have to meet it by reducing the expenditure or by increasing taxation. I wish to direct your attention to both these points—I am not now prepared to suggest any way in which expenditure can be reduced. It is a matter which requires very deep and careful consideration, and I am not prepared to enter into it.

3365. I understand you that you consider that the revenue which we obtain from opium is an uncertain revenue, and that if it fell off we should have to adjust it, either by reducing expenditure or by imposing new taxation; but that in what particular way we could reduce expenditure, and whether we could impose new taxes or not, you would rather not express an opinion upon now?—Yes.

3366. I understood, from your last evidence, that we obtain profit from opium in two ways:

0.59.

in a direct way and in an indirect way. The direct way is what is put down as the opium revenue, and the indirect way is this: that if it was not for the growth of opium, the amount which we obtain from land revenue would not be so large?—In Bengal Proper, and some of the districts of Benares, the amount of revenue would not be affected, because they are permanently settled districts; but the facilities to the landholders for paying their revenue would be very considerably diminished, if advances were not periodically given by Government for the cultivation of opium.

3367. But what I wanted to bring out was this: in districts where there is not a permanent local settlement is it not the case that the land revenue is larger, owing to the growth of opium?—Yes; the revenue would not be affected during the currency of the existing settlement, but when a new settlement had to be made I think it is probable that if there were no opium cultivation the revenue would be less.

3368. Could you give us any estimate at all of the possible loss to the land revenue if the growth of opium were greatly curtailed?—No, not the least.

3369. You stated in your last evidence that we obtain a certain revenue from the sale of opium, did you not?—Yes.

3370. I think in one of your answers you stated that we sold it at near the cost price?—At little more than the cost price in the opium-producing districts; but the further you go from the opium-producing districts the price charged for what is called Abkari opium increases until at the greatest distance it arrives at its maximum.

3371. Then how is that maximum adjusted; so as to cover the cost of carriage?—No, the maximum is taken at the highest amount that it is supposed that the people can pay without smuggling; because the further you go from the districts of production the greater the difficulty of smuggling, and therefore the larger the price which you can demand for it.

3372. Then you stated in your evidence last time, at the close of it, that we obtained from the sale of this opium to our own people an amount, I forget the exact figures, but I think nearly three times the cost of the opium. Am I not correct in that?—Twenty-lacs, that is 200,000 £.

3373. And what was the cost of that opium?—That is net; we actually obtain about 300,000 £ gross, and the cost of the opium is about 100,000 £.

3374. So that you sell it at more than I stated?—At about three times the cost.

3375. Therefore you may say generally that your sales of opium in India, as well as in China, are adjusted to obtain the utmost revenue possible?—Yes.

3376. Does that 20 lacs which is obtained represent the whole of the sale in India?—The whole of the sale in Bengal and the North Western Provinces.

3377. Have you any estimate of the whole of India also?—Opium is not sold in any other part on account of the Government, I think. I am not aware that it is.

3378. *Chairman.* Is there not a large license in the nature of an abkari?—I think that in other parts of India the local opium revenue is raised by licenses; not by the sale of opium at the Government agency.

3379. Is it not a heavy license in the nature of an abkari license?—Yes.

x 2 +

3380. Mr.

Sir
C. Beadon,
R.C.S.I.

5 May 1871.

Sir
C. Beadon,
K.C.S.I.

5 May 1871.

3380. Mr. Fawcett.] Can you give an estimate of what these licenses bring in?—No, I have not the data before me.

3381. Those are not included in the 20 lacs?—No; the 20 lacs are simply the profits derived from the sale of opium which is manufactured at the Government agencies, and supplied to the districts of Bengal and the North-Western Provinces for sale to the consumers.

3382. Has there ever been any complaint from the authorities in China as to our exporting these large quantities of opium there?—I never heard of any.

3383. Mr. R. Fowler.] I believe the system is that the Government prohibits the growth of opium, except in certain provinces?—Yes.

3384. The prohibition is very strict, I believe?—Absolute.

3385. Then, does the prohibition apply to the other provinces?—No.

3386. There is no opium grown in Madras and Bombay, is there?—I am speaking of the action of the Bengal Government. The Bengal Government has no authority except in Bengal itself, and also in regard to opium, a certain qualified limited authority in the North-Western Provinces.

3387. But it is a fact, is it not, that there is no opium grown in either the Madras or Bombay Presidency?—I am not sure; I know that it is grown in the Punjab.

3388. I am not speaking of the Malwa opium, that is an independent State, I believe; but my question was, whether the growth of opium in the English territories in India is not limited to certain provinces in the Bengal Presidency?—I am not able to speak positively upon that point. In the Bengal Presidency it is limited to certain districts, but whether it is limited in Madras and Bombay, I cannot state positively.

3389. Still you never heard of any opium being produced in either Madras or Bombay of much practical moment?—No.

3390. Then, I think one statement was that, under the system which we pursue, it comes to an *ad valorem* duty of 180 per cent.; that was stated by you in answer to a question which Mr. Fawcett put just now?—Seven-elevenths, I think I said.

3391. Is any ryot at liberty to grow opium; he requires a license from the Government to do so, does he not?—He must apply for a license at the same time that he applies for an advance.

3392. And the ryot always receives the advance if he applies for it?—The ryots are not asked to cultivate, but it is open to any ryot to come to the agent and say, "I have land which I wish to cultivate with opium, give me an advance."

3393. And, practically, they all receive an advance?—All.

3394. Is opium much consumed by the natives of India?—It is difficult to give an answer to your question, because I think the circumstances of different parts of India are so very different. In Malwa and the Rajpoot States, I believe it is very largely consumed.

3395. Malwa is not under our Government?—No; it is not directly under our Government. I do not think that the consumption in Behar and Bengal is very great. In the opium-producing districts where the opium is made by the people, there is no doubt a great deal of opium consumed by the manufacturers which never finds its way into the Government factory.

3396. Then the action of the Government has been, while encouraging the use of opium in other countries, to discourage the use of it among their own subjects?—Certainly.

3397. What is the reason for that?—The object of the Government has been simply a fiscal object, to get as much revenue out of opium as it possibly could. It therefore sells opium to its own subjects at as high a rate as possible, and it also endeavours to derive from the sale of opium for exportation as large a price as it can obtain.

3398. But, in a fiscal point of view, is it indifferent to the Government whether it is consumed by their own subjects or by the Chinese?—Not quite. The profit upon opium sold for exportation is very much greater than the largest profit which we obtain on opium sold to our own people. We only sell the opium to our own people in order to prevent them from attempting to smuggle opium, and to sell it without payment of duty.

3399. But it has been the wish of the Government not to encourage the consumption of opium among their own subjects?—I do not think that the consideration has had much weight with the Government, as far as I know. I think their object has been to get as much revenue out of the consumption of opium as they possibly can.

3400. And the Government would have been quite ready to see it consumed by their subjects as well as by the Chinese?—I do not think the Government have ever regarded the subject in that point of view, but only looked upon it in a fiscal point of view, and endeavoured to get as much revenue out of it as they possibly could.

3401. Is it a fact that, while opium is largely cultivated in India, and exported from it, it does not seem to be consumed as largely there as might be expected; and, if so, to what do you attribute that fact?—As I said before, the people of Bengal and Behar are not so largely an opium-consuming population as the Chinese are.

3402. But is that not owing to the action of the Government; the Government have taken no part in encouraging it?—I think not. The fact of the Government levying a high duty upon the consumption of opium must have indirectly a tendency to check consumption, but I look upon that as incidental.

3403. What is the effect on the character of the population in the districts where it is grown; are they as fine and healthy a population as in any other part of India?—Quite so, as far as my observation goes.

3404. The Bombay system is a transit duty, is it not, of 600 rupees a chest?—Yes.

3405. You have no doubt seen the Minute of Sir William Muir, dated the 22nd of February 1868, on the taxation of Malwa opium, and the revenue derived from opium in general?—No, I have not seen it.

3406. Sir W. Lawson.] Might I ask you how the sale of opium in India is regulated; is it free?—The opium which is prepared for sale in India is made up in a different way from the opium which is prepared for exportation to China, and is packed in chests of a different size and description. One or two of these chests are sent to the collector of every district, and it is sold by one of the officers of the collector's establishment to licensed vendors, at the fixed price, and they retail it to the people.

3407. Then it is sold directly by the Government, the same as the exported opium?—Yes; it

it is sold by an officer of the collector's establishment, whose business it is.

3408. He sells it to the retailers, and they make their profit out of it?—Yes.

3409. Then, is it sold for smoking or for eating?—Chiefly for eating; and it is not eaten in its rude state, but it is made up into all sorts of messes of different kinds, and consumed in that way.

3410. Are you aware whether there is a great consumption of it in the districts where it is grown?—As far as the opium sold by Government goes, there is a very much less consumption of opium in the districts in which the poppy is grown, than in those districts where it is not grown.

3411. Have you any way for accounting for that?—The only way in which it can be accounted for is this: that the people supply themselves from the cultivators.

3412. Surreptitiously?—Surreptitiously.

3413. Have you observed the effects yourself upon the people in those districts where it is consumed in India; have you been able to observe them from your own knowledge?—I have been a great deal among the poppy cultivators of Behar, and I consider them a very healthy race. I never saw any people suffering from the use of opium.

3414. In this minute of Sir William Muir's, he advocates a different policy in regard to opium, and I understand that he advocates the giving up by the Government of their monopoly; that they should put an export duty on and continue the license duty, and he says, "Thus the action of Government will be that of check, and no longer a stimulus;" is that the policy which you would recommend in this matter on export and license duty, and the abolition of the monopoly?—The only reason for maintaining the present system is, that it is believed that it yields a very much larger amount of revenue than any other system would yield, as, for instance, an export duty. I do not know that the Government is particularly wedded to the monopoly system, except as a fiscal agent of great power, by which they are enabled to extract from this article of opium the largest possible amount of revenue.

3415. Then you would not wish to express an opinion as to the desirability of the monopoly being given up and the export duty being substituted?—As a fiscal question, do you mean?

3416. I merely quote his words; he advocates it, and says: "Thus," that is, by the system I have named, "the action of the Government will be that of check, and no longer of stimulus;" that is his reason for advocating that policy; you do not wish to express an opinion on that?—I think that if the system were changed, it would lead to a loss of revenue.

3417. And would diminish the consumption?—Not necessarily, if you allude to the supply to our own people. Assuming the consumption to remain the same, the Government would derive less revenue from it than they do under the present system.

3418. Then you think the present system is the best for deriving a revenue?—Certainly.

3419. Have you ever had your attention called to an opinion expressed three years ago by 25 of the most eminent medical men in this kingdom, who said that they could not but regard those who promoted the use of opium as an article of

luxury as inflicting a most serious injury on the human race; and do you agree with that sentiment?—I do not consider that the Government does promote the consumption of opium.

3420. But those gentlemen said they should regard those who did promote the use of opium as "inflicting a most serious injury on the human race"; would you consider the promotion of its use as inflicting such an injury; I merely ask whether you agree with that opinion?—I do not quite understand the drift of the question.

3421. I do not know that I have any right to ask your opinion; but I thought that being acquainted with the opium revenue you would have an opinion on the point; I merely ask whether you would agree with these medical men who consider promoting the consumption of opium to be "inflicting a most serious injury on the human race"?—It does not appear to me that that opinion has any bearing upon the action of the Government in the matter.

3422. No; but would you consider promoting the use of opium to be "inflicting a most serious injury on the human race," if it should be proved by any other witness that the Government does promote it?—But if I were to say that, I should condemn the manufacturers of all stimulants throughout the world; I am not prepared to utter such a wholesale condemnation as that.

3423. Then I will give you the opinion of others who are not medical men; are you aware that in a despatch to the Governor General, of the 24th October 1817, the Court of Directors said: "Were it possible to prevent the use of the drug altogether except for the purposes of medicine, we would gladly do it in compassion to mankind;" I should like to ask whether you would think it would be an act of compassion to mankind to act on that policy now?—I am not a teetotaler.

3424. Then not being a teetotaler, but being acquainted with the opium traffic, I will ask whether you agree with my honourable friend, the Under Secretary for India, that the indulgence in the use of opium brought no more evil than did the moderate use of wine to persons in this country, and that on the side of opium there was this great advantage, that even its moderate use did not tend to incite the consumer of it to crime?—As far as my knowledge goes I do not think it so injurious as alcoholic stimulants.

3425. Are you aware that Mr. Bruce has mentioned it as a deleterious substance, in his Licensing Bill?—No.

3426. Is it true that while the Government make an enormous profit on the cultivation of opium, the ryot incurs all the risk of the failure of crops, and that the more he is compelled to take advantage of the Government the less he is able to exercise his own freedom of action?—The ryot is not compelled to take advances from the Government.

3427. Are you aware why, if the drug is not deleterious, the Emperor of China prohibited its use; have you any information on that point?—I have no information.

3428. It was merely a foolish fancy of the Emperor?—I have no information on the point.

3429. Are you aware whether some years ago the Government officials ordered an unwilling peasantry to the west of the Jumna, by the bait of large advances to grow opium?—I never heard of such a thing.

3430. Are you aware whether the land which is employed for the growth of the poppy is filched

Sir
C. Beadon,
K. C. S. I.

5 May 1871.

Sir
C. Beadon,
K.C.S.I.
May 1871.

as it were from the growth of corn, and that it would otherwise be employed largely in the growth of grain?—I have no doubt that most of the land upon which the poppy is grown would also grow wheat, but the poppy is a much more profitable crop for all concerned.

3431. Mr. Baring.] You mentioned, did you not, that you expected that Persia would put an export duty upon opium; is there any ground for that expectation?—I did not say I expected it; I said I thought they might.

3432. There is no positive ground for expecting that?—No; I only considered it a likely and probable thing.

3433. Is there any estimate as to the comparative cost of producing opium in India, or in Persia, or in other countries?—Not that I have seen.

3434. Can you form any idea whether in the absence of all limitation or export duty, or profit, opium could be produced in India cheaper than elsewhere by the population at large; I mean without any limitation or restriction?—No, I do not think that that is a question which I can answer. I suppose that everything can be produced cheaper in India than it can in China, because wages are lower.

3435. And cheaper than in Persia?—I do not know anything about Persia; I cannot tell.

3436. Mr. Beach.] May I ask whether the advance to the cultivators is made because there is considerable expense incurred in preparing the land for the cultivation of the poppy?—Yes, it is because they have to expend money in the preparation of the land, its irrigation, purchase of seed, and so forth, long before they get any return; advances are customary in all transactions in India.

3437. It is profitable to the cultivator generally afterwards, is it not?—I believe it is very profitable to the cultivator.

3438. Does the crop vary much according to the season?—A good deal.

3439. Is the whole of the amount which is converted into opium sold during the same season?—The season at which the opium is produced is the spring of the year, March, April, and May; that is the season for producing the opium; it is brought to the Government Factory, and there it lies for a considerable time in large tanks, so as to acquire a uniform consistence; it is packed after the periodical rains are over in October, and sent to Calcutta. The opium which is produced in the spring of one year is not sold till the following year; it is then divided into 12 portions, and sold, one portion in each month of the following year; therefore, the opium which is produced in the spring of 1870, begins to be sold in the Calcutta market in January 1871, and the sales of that opium continue till December 1871, and then the provision of the next year is ready.

3440. Would it deteriorate if it were kept to another year?—Not a year, certainly. As far as my experience goes, I do not think that opium deteriorates by some keeping; I cannot tell how long it would keep without deteriorating, but certainly it would not deteriorate in one or two years if properly kept.

3441. I believe it has been stated that the object of the Government is to sell, as far as possible, an even quantity every year?—That is my opinion.

3442. It has been stated that in Bengal 50,000

chests would be the amount?—Something about that.

3443. There is a large amount received in Bombay. Is it chiefly from opium which is brought from the Lower Provinces?—No, most of the opium which pays the export duty at Bombay is made in the States of Central India and Rajpootana, which are not directly under our Government. The manufacture is carried on entirely by private individuals, and they pack the opium in chests, and bring them to be weighed; there are Government scales at certain fixed points, and there they are weighed and passed on to Bombay, and at Bombay they pay the duty.

3444. How is it that out of the last return 1,820,683 *l.*, which is given as the cost of collection, 1,817,510 *l.* is charged to the Bengal collection?—That includes the price of the opium paid to the cultivator. If you look at the Parliamentary Return of the Finances of India you will see in the last column that the cost price paid to the cultivator forms a very large per-centage of the gross revenue, but that the actual expenses of collection are not more than 1·7 per cent.

3445. But still it seems a very small amount for collection, 3,173 *l.* for Bombay, when the receipts are 2,357,000 *l.*?—Because there are no advances to cultivators there; that is the difference. In Bengal the charges against opium include the price of the opium paid to the cultivator.

3446. Then, in the Punjab, I see that there is 1,375 *l.* received, and no charge for collection?—It forms there a branch of the Abkari; that is for local consumption.

3447. Sir D. Wedderburn.] A large proportion of the Bengal opium is exported to and consumed in the Straits Settlements, is it not?—Some portion.

3448. A considerable proportion?—Not considerable as compared with the whole.

3449. I have observed that it was very considerable; I mean the amount exported to places outside the limits of the Chinese empire?—My impression is that it is something less than one-tenth of the whole—I cannot tell you exactly what it is.

3450. The quality of the Bengal opium, and the price that it fetches in the market, is less than that of either the Malwa or the Persian opium, I believe?—I cannot say about the Persian opium, but a chest of Malwa opium fetches a higher price in China than the Bengal opium. The reason is that the Malwa opium, though about the same weight, is prepared of a much higher consistency than the Bengal opium. Bengal opium is prepared at a consistency of 70 per cent.; that is, each ball of opium consists of 70 parts of opium, and 30 water. The Malwa opium contains 90 parts of opium, and only 10 parts of water. Therefore, it is intrinsically more valuable.

3451. And to that cause alone you attribute its higher price?—That is the only cause, I believe.

3452. The Bengal poppy has quite a different flower from the Malwa poppy?—I never heard that there was any other reason but that which I have named.

3453. With regard to the cultivation of opium in the native states, what limit is placed upon the extent of cultivation?—I am not aware that there is any limit.

3454. Then it might extend indefinitely in those countries?—I believe so.

3455. Is

3455. Is there in the Bengal Presidency reason to believe that much opium is smuggled across the frontier from the Central Indian States?—No, I doubt if there is any smuggled into Bengal.

3456. Is there not reason to believe that in Bengal the amount consumed is very considerably in excess of the amount furnished to the retail dealers by the Government?—Only in the opium-growing districts.

3457. I fancy that while it is a crop of which it is very easy to prevent the cultivation, it is a drug that is more easily smuggled than perhaps any other, from its intrinsic value and small bulk?—That is the case. It is very difficult to prevent smuggling.

3458. We have had considerable difficulties in past times with some of the independent States on that very question, particularly with the Rajpoot States, I think?—I am not aware of that.

3459. The opium crop is somewhat precarious, is it not. When just about to be collected, a shower of rain will wash away a very large proportion of the harvest after the capsules have been sacrificed and the juice has exuded?—Yes; I have heard it said that a night's rain will destroy 10,000 chests.

3460. Is not it true that while the Government derive an enormous profit from opium, the peasantry take all the risk of a failure of the crop?—To a certain extent they do; but in practice whenever a ryot cannot pay his advances in kind by the delivery of opium, the difference is remitted to him. Government never insists upon payment.

3461. And is the crop precarious at any other stage than that of collecting the produce?—Not where there is a full command of water for irrigation.

3462. Mr. Bourke.] I think that on the whole, your evidence goes to this, that although there may be many objections to this Government monopoly, yet, at the same time, the profit is so great that the Government would not be justified in abandoning it, unless they saw clearly their way to supplementing the revenue to an equal amount by some other means?—That is my opinion.

3463. Now, has it ever been seriously contemplated by the Government of Bengal to abandon the growth and production of this drug altogether, and to supply in its place an excise duty?—Never, that I know of.

3464. I think you said on the last occasion that some years ago, I think 10 years ago, there was a great reduction in the growth and production of opium throughout the country?—Yes, there was.

3465. That was an intentional reduction on the part of the Government?—Yes, it was.

3466. What was that owing to; what was the view of the Government in reducing the growth and production in that year?—In one year, in the year 1853, there was a very productive season, and a very large number of chests were produced. The custom at that time was to sell the whole crop of one year in the course of the next year; and the consequence of bringing this very large crop to market was that the prices went down to 700 rupees a chest, and the net revenue suffered considerably. The consequence was that the Government became alarmed, and determined to reduce the cultivation in order to restrict the annual provision, and they did it by reducing the

0.59.

price paid to the cultivators. The consequence of that was that fewer cultivators came forward to take advances, and the area cultivated became less and less, until in 1861–62 the provision was reduced to 21,000 chests. The price then rose to nearly 2,000 rupees.

3467. Did the rise of price in India consequent upon that operation increase or diminish the price in China for China-grown opium; I mean did it stimulate the growth of opium in China?—I have no doubt that it did.

3468. And in Persia?—And very likely in Persia.

3469. I suppose, then, your object will be always to try and keep down the competition of China and Persia, as compared with India?—I think that ought to be our policy; to maintain a large area of cultivation.

3470. I think you have told already one honourable Member that you were not prepared to say whether the soil of India was much better and more favourable for the cultivation of opium than that of either Persia or China?—It is a question that I cannot answer.

3471. Sir J. Elphinstone.] Has the production of opium in China, which has increased very much of late years, permanently lowered the sale price of opium in Calcutta?—It is very difficult to say how far it has had that effect. It seems to me, looking over the accounts of the last few years, that the price has been more affected by the quantity of opium brought into the market by the Government than by anything that goes on in China.

3472. In fact, the increase of cultivation in China, if there is an increase, has not shown itself distinctly, as affecting the market in India?—I do not think it has.

3473. I think you said that the touch of the Patna opium is 70, and that of the Malwa 90, and that the China was 30 per cent. below Patna?—I said that the touch of Patna opium was 70, and I gather from the papers which have been published that Patna opium in China is worth 50 per cent. more than China opium; but whether that arises from difference of touch or difference of flavour or quality I cannot tell.

3474. That brings the China down to 35?—No, not necessarily. I do not think that the price of opium depends upon the touch, but upon the quality and flavour.

3475. The China opium is very coarse, is it not?—I believe it is.

3476. With regard to the permanency of the opium revenue, you are aware that, some years ago, the duties on French wines were made very much lower in this country. Can you now, for your purposes, buy first-growth claret cheaper than you could 10 years ago?—I was not in England 10 years ago.

3477. But, as a matter of fact, is the price of first-growth claret cheaper now than it was 10 years ago?—No; I believe not.

3478. Is there any reason to suppose that the price of the first-class opium will fall in China by the introduction of a lower and coarser article?—I do not think it has had that effect yet.

3479. Taking the quantities of opium as they were given to me by an authority on opium, I find that the last year that we have it was estimated at 60,000 chests. I think that the Bengal opium produced more than that, did it not, in 1870?—No, the quantity of opium produced in 1870 was 54,000 chests.

x 4 +

3480. I think

Sir
C. Beadon,
K.C.S.I.
5 May 1871.

Sir
C. Bradon,
K.C.S.I.,
5 May 1871.

3460. I think it was estimated at 60,000 chests?—The actual produce of opium for exportation was 54,000 chests. Then, besides that, there was a good deal made for Abkari, and medicinal purposes.

3481. Malwa was estimated, according to the same authority, at 35,000 chests, Damaun was supposed to export 15,000 chests, and Persia 4,000 chests; in rough numbers that is about the total amount of opium produced and sent round to China; in all 54,000 chests?—I had no idea there was so much exported from Damaun; I would say that I do not think so large a quantity is exported from India.

3482. You think that 110,000 chests is more than is exported from India and Persia?—Yes.

3483. The weight of the contents of a chest is 140 lbs., is it not?—Yes.

3484. Taking my figures roughly to approach the truth, it would be 15,400,000 lbs. weight of opium which would go round to China from India, and you know what the population of China is estimated to be?—400,000,000.

3485. That amounts to half an ounce a head for the population, does it not?—I have not made the calculation, but I dare say it is about that.

3486. Have the Government of India any official reports as to the increase of the Chinese cultivation, the provinces in which that increase is to be expected, and the grounds upon which that opinion is based?—Yes, there is a good deal of correspondence that has taken place on that subject; they have had reports from the consular authorities in China.

3487. From whom can we get that information?—From the India Office. I do not know any one that has any personal knowledge on the subject, but it is all on record.

3488. The smuggling of opium is a very difficult matter, is it not, in consequence of the small of opium?—It is of such great value and small bulk that it is easily smuggled in small quantities.

3489. What was the cause of the famine in Orissa?—The absolute failure of the periodical rains in the middle of September, instead of continuing to the end of October, as they usually do.

3490. Were there not a number of the population thrown out of employment about that time from the suspension of the salt manufacture, and other reasons?—Yes; there were certain portions of Orissa lying immediately on the sea coast that had relied a great deal upon the Government manufacture of salt, and when the Government ceased to manufacture salt they were deprived of that means of gaining subsistence; and when their crops failed, they had nothing to fall back upon.

3491. What are the means of communication between the Province of Orissa and the rice-producing districts of Bengal; is it entirely by sea?—I think there is a canal communication now, but there was not in 1866. The only communication was by sea in 1866.

3492. The canal is now commenced from the Chilka up to the Hooghly?—I do not think it is finished from Chilka, but from the Mahanuddy up to the Hooghly; I think there is a communication now by canal.

3493. The Mahanuddy is the boundary?—No; the boundary goes down to the Chilka.

3494. Have there been any means adopted to open the mouths of the Mahanuddy by dredging

or otherwise, to enable supplies to be taken in?—There is a very tolerable port at the mouth of the Mahanuddy.

3495. What becomes of the harbour dues in India; are they applied to the improvement of the ports, or do they go into the general revenue of the country?—There are port funds at every port, and the harbour dues are carried to the credit of the port fund, and out of the fund are defrayed all the expenses of the harbour.

3496. And improvements?—Yes.

3497. Sir T. Bazley.] In some of the native states opium is grown?—Yes.

3498. Is it permitted to be sent across the British territory to market?—No; except packed in chests and under a pass.

3499. And is any transit duty taken?—None. I believe that at the scales a small fee is paid when the chests are weighed.

3500. And has that opium; grown in native states, the same advantage of export that the British opium has?—Just the same.

3501. Mr. Lyttelton.] What reason have you for supposing that the imposition of an export duty would result in a loss to the Government in place of the present system?—Simply this: that the Government at present derives from the growth and sale of opium in Bengal a larger profit than the export duty which they impose upon opium exported by Bombay and grown in the native states in the west of India.

3502. How much larger?—It varies with the price; the duty upon Bombay opium is 600 rupees. If Bengal opium sells for 1,200 rupees, and the cost of the production of a chest of opium, is only 400 rupees, there remains a margin of profit of 200 rupees a chest, which the Government makes, over and above the duty of the 600 rupees a chest.

3503. Would it be difficult and expensive, if you did substitute an export duty, to prevent smuggling in Bengal?—I think very difficult.

3504. Has any other method of obtaining this revenue from opium been suggested?—I never heard of any method being proposed except that of imposing an export duty.

3505. Chairman.] Or rather in Bengal it would be an excise duty on the growth?—No; an export duty; a duty on exportation by sea from Calcutta; that is the method which has been proposed as a substitute for the manufacture and sale by the Government.

3506. Mr. Lyttelton.] That would necessitate a preventive service all along the coast, I suppose?—Not along the coast.

3507. Chairman.] The question is, how you could get it to Calcutta to collect the duty?—If you adopted a system of export duty, you must go a step further, and also have a system of manufacture under license and supervision; that is inevitable.

3508. Mr. Eastwick.] Can you make a conjecture as to the number of ryots who are now employed in cultivating opium generally, taking Patna and Benares both?—It is on record somewhere; but I cannot tell you the exact numbers off hand. I can tell you the extent of land that is cultivated; the extent of land that was cultivated in 1869–70 was, in round numbers, 500,000 acres. I suppose, but it is mere conjecture, that on an average each ryot would cultivate two acres; that would give you 250,000 cultivators besides their families.

3509. Then

3509. Then we may say certainly that three-quarters of a million of people, at all events, are dependent upon this opium cultivation in Bengal?—At least that number, I should think.

3510. From your observation, would you say that they were in quite as good circumstances, or, perhaps, in rather better circumstances, than any other cultivators in the country?—Rather better.

3511. In the first place, they receive advances from Government?—Yes.

3512. And they have no actual risk of failure of crop, because, as you stated just now, in case of failure and their not being able to pay in kind, the deficit is written off?—Yes; but in that case they get no profit.

3513. But still they do not suffer the reverses which, for instance, the Orissa people did, or which any cultivators of grain whose crops fail would suffer?—No.

3514. In fact, there is no selling-up of the opium cultivating ryot for the Government on account of failure?—No; irrecoverable balances are always remitted.

3515. And there is nothing deleterious to them in the cultivation; but the cultivators are a healthy people, they do not suffer from the cultivation?—No.

3516. Is it found that they themselves indulge in opium at all?—It is merely a matter of suspicion; I suppose it is impossible that opium can pass through the hands of a vast number of men like that without some portion of it sticking to their fingers.

3517. But there is nothing in their physical appearance, or in the state of their health, to indicate it?—Nothing. I never heard of any excessive opium eating among that part of the population.

3518. It is also a fact, is it not, that the plant is extremely useful, not only to be sold as a drug for China, but also in many other ways; for instance, some part of the plant, some of the seed, is given to cattle?—The stubble of the plant is fodder for cattle; the seeds are used to make oil. There is a large trade in oil seed. The mere petals of the poppy are all sold. Every part of the plant has its value, and the ryot is left to make what he can out of his plant. All that the Government asks him for is to give up the opium on payment of a fixed rate.

3519. Then, no doubt, he does make a profit out of the plant?—Yes.

3520. And it is also a fact, is it not, that it is very largely used as a medicinal drug?—Yes.

3521. For various poultices, and in many other ways?—Part of the annual provision of the Government is made into what is called medical opium, and supplied to the medical department for medicinal purposes.

3522. Then it is pretty clear, is it not, that the cultivators are an extremely thriving, perhaps the most thriving, part of the cultivating population of Bengal; that it is not only extremely profitable as a matter of revenue, but also to the cultivators themselves?—Very much so, certainly.

3523. Now, I will ask you just to turn your eye in the direction of Assam: is it not the fact that the population of Assam is almost entirely demoralised by the quantity of opium which is produced and used there?—It was.

3524. There has been a change lately, has there?—Some 10 years ago the Government

prohibited the manufacture of opium in Assam; up to that time it had been free.

3525. And during that time the population was immensely demoralised?—Very much demoralised. The reason that was assigned for it was, that it was eaten by the women and children; the children, from their earliest years, were accustomed to suck rags saturated with opium.

3526. Now, supposing that the Government were to withdraw its hand altogether from this monopoly, is it not reasonable to suppose that you might have a state of things like that which existed in Assam; that you would at all events have a considerable use of the drug among the population which does not at present exist?—If the cultivation were entirely unchecked, no doubt such a state of things might arise.

3527. And even if the Government monopoly were done away with, and you put on an export duty, there would be a danger of it?—Unless you adopted a very strict system of excise supervision, equivalent to the supervision now exercised over the Government growth.

3528. But there would be considerable difficulties in that, would there not?—I think the difficulties would be great.

3529. I do not know whether you have been in Rajpootana yourself, but you have heard that the Rajpoots do use opium?—Yes, I believe, largely.

3530. In Kattywar, for instance?—I believe, largely.

3531. There would be a risk, therefore, of the population of Bengal being seriously injured if we changed our system, would there not?—I have no doubt that the present system tends very largely to diminish the consumption of opium in the Bengal districts, and if the restrictions were withdrawn I think it most probable that the consumption would largely increase.

3532. Then, supposing that there was a change of system, you would have, as you have stated, a certain very strong risk of loss of revenue, and a risk also of demoralisation of the people?—I think you would.

3533. Then, I would ask, is it not the fact that the people of India have another means of intoxicating themselves if they wish, and that they use that very liberally: I am speaking now of bhang and churrus, and those other things which they get from hemp?—Yes; those things are very much used.

3534. Then, in a moral point of view, our doing away with this monopoly of the opium in Bengal is not likely to be very effective as regards the morals of the people, because they do use this bhang and churrus very freely; and supposing that we took away the opium altogether, or took away our monopoly of it and prohibited its cultivation, even if they did not use opium they would certainly use more of the other intoxicating substances?—I think the result of withdrawing restrictions upon the cultivation of the poppy would be to lead to a very largely increased consumption of opium, but I do not see how it would lead to a further consumption of bhang.

3535. If men wish to intoxicate themselves, they would probably turn to other sources if one were shut out?—Yes.

3536. I do not know whether you have noticed the Chinese in Calcutta; do they use the opium?—Very largely.

3537. Do they smoke it?—They use it in different shapes, but they chiefly smoke it. They

Sir
C. Beadon,
K.C.S.I.

5 May 1871.

Sir
C. Beadon,
K.C.S.I.
5 May 1871.

have also a sort of conserve made out of it; they mix it up with sugar and butter.

3538. That is what they call majún?—Yes.

3538*. It is the fact that experiments have been made upon the Persian opium at Bombay; was no report sent round to you on those?—I do not remember to have seen any report on the Persian opium.

3539. But I believe it has been ascertained that the Persian opium is extremely good?—I understand that the Turkey opium, which I suppose is pretty much the same as the Persian opium, is much superior in quality to the Bengal opium.

3540. Then there would be a greater risk from the cultivation of opium in Persia than from its cultivation in China, because the Chinese opium is a coarse opium?—So it is reported; but, as I said before, I think that it is much more a matter of flavour and taste than actual intrinsic chemical qualities.

3541. Have we any means whatever of putting a restriction on the opium trade from Persia; that is to say, it is carried round in English vessels, is it not?—I take it that it is chiefly in English steamers.

3542. It has not been considered by Government whether anything might be levied on those vessels?—Yes, the question has been considered; it has been the subject of discussion. I believe that it is a great object of the merchants in the Persian Gulf to be able to send their opium to China *via* Bombay, because there is no traffic direct from the Persian Gulf to China unless they charter a special ship for the purpose. It would require a great deal of opium to fill a ship, and their object is to get the Government to allow them to ship their opium on board steamers which touch at Bombay, and to tranship their cargo there to other steamers going from Bombay to China. Under the present law that cannot be done. If any opium is brought into the port of Bombay it is immediately confiscated; and under the present state of the law the Government cannot allow of any such trade being carried on; but I understand that there is now a proposition which is before the Government, and is being seriously considered, to impose a tax, a sort of transport duty, of 50 rupees a chest upon all Persian opium transhipped at Bombay.

3543. And in your opinion that would be a politic thing?—I think so. You may as well make what you can out of the Persian opium; you cannot stop it.

3544. You cannot stop it, but you might no doubt raise a considerable revenue from it?—I think that you ought to take as much as it is worth the while of the merchants to give you. If it is worth their while to pay 100 rupees a chest for the advantage of transshipment at Bombay, I do not see why we should not take it.

3545. It is the fact, is it not, that the opium is used a good deal in the hookahs; that there is a mixture of opium in that?—I believe there is, but in small quantities.

3546. Even in the hookahs it used to be used by the Europeans?—I believe there was a small quantity of opium mixed.

3547. It was never supposed that there was anything very deleterious in it?—No, not deleterious; it was used to produce sleep.

3548. Can you say whether the Bengal Government have ever received, or have endeavoured

to procure, any regular information on this subject from China from our consuls; have reports, for instance, been sent to them?—Entirely there has been a great deal of correspondence on the subject with the authorities in China, and a great deal of information has been sent, but it is extremely contradictory, and very difficult to make anything out of.

3549. Mr. B. Denison.] It is the fact, is it not, that the Persian opium is sold already in China at a higher price than the Indian opium?—I am not aware; if it is so stated in the correspondence, I have no knowledge of it.

3550. It is also the fact, is it not, that while the consumption of opium in China itself is steadily on the increase, the trade of India in opium is stationary, not increasing and not decreasing?—I do not accurately know.

3551. I was about to draw your attention to this, that from the year 1830 up to 1858, the trade was steadily on the increase as long as the British Indian Government had a monopoly of the opium trade, and that from that date, since the consumption of Chinese-grown opium has been increasing, the Indian trade has become stationary?—It may be so; I have no accurate knowledge on the subject.

3552. Now I will turn to India; as regards the actual area of land under opium cultivation, is there any difficulty in keeping up the quantity of land?—None whatever; wherever the Government declares its willingness to give advances, the people are willing to come forward and take them.

3553. Do you state that generally, or do you state it with reference to the enhanced price that has been given for the opium in recent years; because there was a period when the area was decreasing?—Up to the time at which the price paid for opium was less than four rupees, the cultivation fell off, because it was not worth the while of the ryots to take advances at that rate; but as soon as the Government raised the price to four rupees and five rupees, they came forward most willingly, and the cultivation rapidly expanded. Then again, in 1866, the price was reduced to four rupees eight annas, but it has not been found that that reduction has had any sensible effect in reducing the cultivation; therefore the inference is, that four rupees eight annas is enough for that area. In 1869-70, which is of course the last year up to which we have any information, the cultivation on those terms increased largely.

3554. Then you are decidedly of opinion that the cultivation as it now stands is entirely voluntary, without any pressure or compulsion on the part of the officials?—Perfectly so.

3555. And the cultivators are entirely at liberty to throw up their land if circumstances change, and the price is not remunerative?—Perfectly so.

3556. With reference to the greater profits which may be made from the cultivation of tobacco and sugar, and one or two other things, how is it that there is a general disposition to cultivate opium in preference to those more profitable products; is it owing to the system of ready money advances, and certainty of the payment for the produce, or to what is it owing?—Those circumstances of course have their weight, but I think that in most instances the cultivation of opium is more profitable than the cultivation of tobacco and sugar.

3557. There

3557. There are some statistics here, prepared by Mr. Hampton, showing that tobacco is very much more remunerative than opium cultivation; but I was under the impression that it was the system of ready money advances that made the opium cultivation popular?—No doubt it tends to make the cultivation of the poppy extremely popular. The ryot gets the advance just at the season of the year when he most requires the money.

3558. And, moreover, his crop for the time being is by law removed from any restraint?—Yes, that, of course, is an advantage also.

3559. Have you ever had complaints made to you when in India by cultivators, of being compelled to give their land against their will for opium cultivation?—Never.

3560. Not even at the time when there was a spasmodic effort made to increase the amount of cultivation?—No, I never heard of any one being compelled to cultivate against his will.

3561. There is a very strict law against that, namely, the law of 1857, which says, "Any inferior officer who shall compel, or use any means to compel, any cultivator to enter into engagements, or to receive advances for the cultivation of the poppy, shall be liable to be dismissed from his situation," and so on?—Yes, that is the law.

3562. You have already said that there is no case within your knowledge in which that has occurred?—No, I have never heard of a case of that kind.

3563. How you account for the steadily growing consumption of Abkari opium?—The great increase has been in the province of Assam.

3564. Not in the Punjab, where they do not smoke, but where they do eat opium?—That is not Government opium; I can only speak of the opium which is manufactured and supplied by the Government; that does not extend to the Punjab.

3565. But as far as your own experience and knowledge of India goes, there is no particular moral evil connected with the cultivation of opium; as regards the actual cultivators of the soil, they are not a bit more degraded or debased than any other cultivators?—No, certainly not.

3566. And, in their material circumstances, they probably are rather better off; that is my experience; is it yours?—I think so.

3567. An honourable Member near me referred to some alternative mode of dealing with the cultivation: all the local authorities up to the present day, who have personal knowledge of the feelings of the people, are opposed, are they not, to anything like an acreage tax on the cultivation of opium?—All that I ever had any communication with are opposed to it.

3568. Because it would subject the cultivators to great uncertainties from the fluctuations of the tax, and also because of the inquisitorial nature of the supervision which would be exercised over them?—Those are objections; but the chief objection is, that it would be a sacrifice of revenue. You could not get any revenue by such a tax as that.

3569. That is a difficulty, to combine any two things, the security of the revenue and the freedom from taxation of the people?—Yes.

3570. Mr. J. B. Smith.] Sir James Elphinstone has asked me to put this question to you: Are you aware that Turkey opium, which was once largely exported to China, is not now sent

0.59.

there?—I believe that what they call Persian opium is, to a great extent, Turkey opium; that is to say, it is grown in Turkish Arabia, not only in Persia.

3571. Then it is merely the same thing under another name?—I believe that a great deal of that is grown in Turkish Arabia.

3572. Sir D. Wedderburn.] But is it not the case, that the opium which used to fetch the highest price in the market was grown in the neighbourhood of Smyrna?—I do not know that Smyrna opium has ever been exported to China, if so it must have been in very small quantities.

3573. Sir W. Lawson.] Did I rightly understand you to say that the natives of India use bhang as a substitute for opium?—I do not know that they use it as a substitute for opium, but they use it as an intoxicating drug.

3574. I think you said that if restrictions on the growth of opium were removed it would cause an increased consumption of opium in India?—Yes.

3575. Should you consider that an evil to the people of India?—Well, I think it would be.

3576. Then I think you said, in answer to one honourable Member, that some portion of the opium was used for medicinal purposes?—Yes.

3577. But is it not a fact that the bulk of the opium produced in India is not well adapted for medicinal purposes?—I believe it is perfectly well adapted for medicinal purposes; but in Europe, Turkey opium is preferred to Indian opium.

3578. And, I suppose, out of 70,000 chests, it could only be a very infinitesimal proportion which could be consumed for medicinal purposes?—Very small.

3579. Mr. Grant Duff.] You mentioned, I think, that a great deal of opium was consumed in Rajpootana?—Yes.

3580. The Rajpoots are about the finest race in India, are they not?—Well, they are fine strong fellows.

3581. A certain amount of opium is consumed in the Punjab, is it not?—So I believe.

3582. You have never heard that it has in any way injured the physical development of the Sikhs, have you?—No, I cannot say that I have.

3583. Sir W. Lawson.] Why do you think that it would be undesirable that the consumption should be increased in India, as you said it would be, if the restrictions were removed; what evil do you anticipate from that?—Well, of course, if the cultivation of the poppy were perfectly free throughout Bengal, and people could consume opium for the mere trouble and expense of growing it, it might encourage a larger use of the drug. To that extent it would, no doubt, be injurious to the people.

3584. Mr. Grant Duff.] You would say, I suppose, that while opium, used in moderation, may not perhaps be deleterious, when used in great quantities (as it was in Assam, and when used by children) it is very deleterious?—That is my belief.

3585. And it is because you do not wish to expose the general population of India to the evils which at one time prevailed in Assam, that you do not want to see the cultivation spread broadcast in India?—Yes, I should regret it.

Y 2

3586. Chairman.]

Sir
C. Beadon,
K.C.S.I.

5 May 1871.

Sir
C. Beadon,
K.C.B.1.
5 May 1871.

3586. *Chairman.*] Can you detect a professed opium-eater by his appearance?—Yes; I have seen some of the natives of Rajpootana and the Western States, who are habitual opium-eaters, and, no doubt, they have a peculiar appearance.

3587. *Mr. J. B. Smith.*] That is where it is taken in excess?—Yes, I am talking of a man who eats two drachms of opium a-day.

3588. *Chairman.*] Would it be possible to levy a tax upon bhang?—In Bengal we do levy a large tax upon bhang. Perhaps I had better go into that under the head of Abkari.

3589. *Sir D. Wedderburn.*] In 1862-63, I find that the revenue derived from Malwa opium considerably exceeded that from Bengal; the Malwa return being 3,222,000*l.*, while from Bengal rather less than 3,000,000 *l.* was obtained; in 1868-69 the revenue from opium amounted to nearly 7,000,000 *l.*, of which two-thirds came from Bengal; what is the cause of that great relative change?—The cause is this, that in the particular year which you mentioned first, the quantity of Malwa opium exported must have been considerably larger than the quantity of opium produced in Bengal.

3590. But is there any special reason for that great relative falling-off in the amount of the Malwa opium, as compared with the Bengal opium, if it has been continuous; I name those as extreme cases?—The seasons are not uniform throughout India. Sometimes you have a favourable season in Western India and a very unfavourable one in Bengal and Behar; so that it may happen, and it does happen, that you have a redundant crop on the one side of India while you have a failure on the other.

3591. But my reason for asking the question is, that I want to know whether, while in Bengal, there is a check upon the extent of cultivation and in Malwa there is none, you consider that any special causes were at work tending to diminish the cultivation in Malwa and to increase it in our own territory; because you said before, that we were to exercise great care in limiting the extent of cultivation in our own territories, and that we had no power to limit it in the Native states; but when so large a supply comes from territories beyond our control, it would seem that we can exercise very little control over the market, even if we limit it in our own territories?—I cannot precisely state what the causes are which limit the cultivation in Malwa.

3592. *Chairman.*] The honourable Member is

rather putting this: what is the use of fixing the number of chests to be exported from Bengal when we have no means of putting any limit to the quantity to be exported from Malwa?—That, of course, renders any measure taken by the Government to equalise the produce of Bengal less efficacious than it otherwise would be; but it removes one element of uncertainty.

3593. *Sir D. Wedderburn.*] Then I want to know whether there is any particular difference between the opium produced in Behar and that which is produced in Benares, because I find, on reference to the Tables in some Returns furnished to this House, that whilst almost the whole of the Behar opium is exported to the Chinese empire, as nearly as possible one-half of the Benares opium is exported to Singapore and Penang?—It is a mere matter of habit.

3594. Have you heard that there was a scheme for establishing a line of French steamers to ply direct between Persia and China to convey opium?—No, I have not heard of that.

3595. Are you aware that in February 1870, 2,000 chests of Persian opium were landed in Hong Kong?—I know that last year there was a large importation of Persian opium into China.

3596. *Mr. Beuch.*] You stated that in Bombay, and in some other parts of India, no system of advances prevailed; I want to know whether you attribute the want of that system to the falling-off of the revenue?—No; advances are made in Bombay and in the Native states, but they are made, not by Government but by private individuals. The falling-off in production is not a permanent or steady falling-off, but merely casual in certain years, and it depends, I take it, entirely upon the seasons, and nothing else.

3597. The sale of opium, I think, is conducted by private auctioneering firms in Calcutta?—For many years the Government employed an auctioneering firm in Calcutta to sell the opium, and they received a commission upon the sale of the opium.

3598. Does not that prevail at present?—I think not. I think it has been changed, and it is now sold by a Government officer. I should like to mention to the Committee the existence of these "Finance and Revenue Accounts" which have been published in Calcutta, and which contain the very fullest statistics upon all questions of salt and opium.

3599. *Chairman.*] What is the date of those?—They were published in Calcutta in 1870. It is a Government publication.

SIR FREDERICK JAMES HALLIDAY, K.C.B., called in; and Examined.

Sir F. J.
Halliday,
K.C.B.

3600. *Chairman.*] WILL you kindly state what principal offices you have held in India?—I went through the usual career of the service in the administrative departments in the interior, until I became Secretary to the Board of Revenue; then Secretary to the Government of Bengal; then Secretary to the Government of India; then a member of the Council of India; and then Lieutenant Governor of Bengal, after which I retired.

3601. You are now a member of the Council of the Secretary of State?—Yes.

3602. Have you heard the evidence that has been given by Sir Cecil Beadon?—I have heard the whole of it.

3603. Do you concur in the opinions which he

has expressed?—Entirely. I do not know that I have anything to add to his evidence in any way, or that I have in any respect to differ from it.

3604. *Sir D. Wedderburn.*] I should like to know whether, in any part of India, you have heard of diseases being prevalent among the natives from an inadequate supply of salt?—Never.

3605. *Mr. J. B. Smith.*] Is it your opinion that the tax on salt is a judicious tax?—There is a great deal to be said against it in the abstract. I daresay, in the eyes of political economists, it may have many faults; but it has, with us in India, some very remarkable merits: one is that it exists, which in India is a very great merit, and

and has existed for a long while. In India, an old tax, even though you may, theoretically, find great fault with it, is better understood and better taken by the people than a new tax which is faultless with political economists; that is a rule: and the salt tax has this in its favour: that, being long established, the natives understand it, expect it, and believe in it, and never make a complaint against it. I myself have never heard a native complain against it. I have often heard them ask, "Why, when you want money for this or that purpose, do you not, instead of putting new taxes on us which we cannot understand, increase the salt tax?" They constantly ask us that question to this day, for instance, with regard to the income tax. A colleague of mine inquired, the other day, of the celebrated Dr. Duff, the missionary, whose knowledge of the natives is very complete, and he told him that, never in all his experience did he hear a complaint against the salt tax, and he had heard a good many complaints. That is saying a great deal in favour of a tax which, theoretically, may have something to be said against it. But there is also this to be said, which has been said by Sir Cecil Beadon, that it is very nearly the only tax which falls upon the people at all. If you were to remove that tax, or any part of it, you would only have to substitute another: and that other, even though, to our ideas, it would be more acceptable, would be almost certainly unacceptable to the natives. It must be understood that, in all our financial and fiscal operations in India, we have to deal with this particular difficulty, that the native hates change; he does not care much about what may seem oppressive to you, if it is old and habitual; but, if you oppress him in a new point, then he complains.

3606. You are of opinion that the natives themselves have never considered this an oppressive tax?—Never; far from it.

3607. Since you have had railways and canals and rivers opened, is it not a fact that the price of salt has been reduced?—Very much reduced.

3608. And, therefore, if the rate of wages has increased three-fold, and the price of salt is much diminished, the tax has been, in fact, lowered?—It has been lowered one-half to the people, no doubt.

3609. Mr. Lyttelton.] Then why do not you take the natives at their word, and increase it?—At this present time it is, or up to a very recent date, it was a controversy in India whether, in place of the income-tax, which was very much disliked, and other taxes which were threatened, if not imposed, to which the natives had the greatest possible objection, it would not be better to improve a higher salt tax; but in these days the English ideas of government are very apt to prevail over the old Oriental ideas in India, and they do prevail in the matter of salt, and the tendency of the Government in India is rather to reduce, if they could, the tax upon salt than to increase it; acting generally upon the principles and the opinions prevalent in this country.

3610. Your individual belief is, that we might increase the tax very well without restricting the consumption of salt?—I believe you might. The tax is at present highest in Bengal. The inquiries that have been made regarding the salt tax have shown conclusively that the salt tax is nothing more nor less than a poll tax. Owing to the great simplicity of the habits of the

people, and their generally uniform habits as to diet, the consumption has no great tendency to rise if you lower the duty, or to fall if you raise it. Of course, if you raised it beyond a certain point it might fall off, but hitherto we have not found that; on the contrary, lately we have increased the duties, and the consumption has increased with the increase of the duties. And therefore it comes to this, as Sir Cecil Beadon told the Committee: the people on the average, man for man, consume every one a like quantity, and it becomes, as I say, a simple poll tax. Then the question naturally must arise, if the salt tax is a poll tax upon the population, why should the population of Bengal pay a higher poll tax, more than double the poll tax that is paid by the Madras population or the Bombay population, and I think it is a question that can only be answered by experiment. The limit, of course, of our increase in every case must be the toleration of the people and the action of the smugglers: there is nothing else to limit it.

3611. You never made an estimate of the possible increase?—No, and I do not think it is in anybody's power to make such an estimate; it is a thing that must be determined by experiment. They have actually done it, and have been doing it for some little time past: in Madras and Bombay they have been gradually putting it up till it is now 1 rupee 13 or 14 annas. I think at one time it was 8 annas; there was a doubt whether the people would stand the increase, and the doubt was always solved in our favour; and I believe it would be a wise policy, without talking much about it, to raise it little by little, until you found that the people were equally taxed with those in Bengal, who are not better off, but rather worse off, than the ryots of Bombay and Madras.

3612. We are diminishing the tax, in point of fact, are we not?—No, it is now 3 rupees 4 annas in Bengal, and 3 rupees in the North-Western Provinces; but the tendency of the last discussions upon the subject, which are not two years old, has been to encourage the Government to reduce it, to equalise it by reduction rather than to equalise it by raising; I do not agree with that myself.

3613. Mr. J. B. Smith.] You are aware that there is a considerable party in this country who consider the tax very oppressive on the Indian people, and they have held meetings propagating that notion; but you state that, from your long experience in India, you are of opinion that it is not so considered by those who pay the tax?—Most assuredly no person with the smallest experience of native opinion would say that they ever complained.

3614. Mr. Lyttelton.] I think Sir Cecil Beadon said that four rupees in his opinion was about the highest point that the tax could be raised to, is that your view?—I should not pretend to state beforehand what I could raise it to, but I would screw it up by degrees. I do not mean that I would begin with Bengal, where it is highest.

3615. Mr. J. B. Smith.] Probably you would not think of imposing any increased tax, unless there was some imperative necessity for it?—Certainly not; or unless by that means I could remove a tax which I found really did oppress the people, and to which they had a strong objection.

3616. Mr. Cave.] Is salt used in India for any
Y 3 except

Sir F. J.
Halliday,
K.C.B.

5 May 1871.

Sir F. J.
Halliday,
K.C.B.

5 May 1871.

except domestic purposes; is it used for agriculture, for instance?—I do not know that it is used at all for agriculture; it is used slightly for cattle, but not to the extent that we should suppose it would be used; and it is not used at all for manufactures; that is to say, for salting meat or anything of that kind.

3617. Is it used for curing fish?—It is a little in Bombay, I am told; in Bengal not at all.

3618. There is no great industry in India for salting fish?—No.

3619. But fish are very abundant?—Yes.

3620. Would it not occur to you that the tax on salt is an impediment to its being used for these purposes?—If I saw any reason to believe that it was an impediment I should act accordingly; but I have never seen anything to cause me to suppose that such was the case. Nobody in India salts his meat; the climate will not allow of it. As for salting your fish, before you can get your fish dry the fish is rotten; the climate will not admit of it. The people dry their fish in the sun, or eat it, I am sorry to say, in a putrid state, but never think of salting it.

3621. Would they not give the salt more to cattle if it were cheaper?—If they would they would probably tell us so. They do not complain that they are shortened in their use of salt for cattle by its price; and if it was so, it would be a thing very fairly and closely to consider.

3622. Do you think that in no agricultural operations would it be used more if it were cheaper?—I think not; and we have had experience of that. Sir Cecil Beadon mentioned that during certain years the salt-tax was reduced from 3 rupees odd, to 2 rupees 8 annas; that was practically my own doing. I did it in the expectation, the foolish expectation as it turned out, that there would be a large increase of consumption, and an equality, or perhaps even an increase, of revenue. Nothing of the sort took place; it produced no effect at all, and after it had had the fullest possible trial and experiment it was given up. That is an actual case in point.

3623. Sir D. Wedderburn.] I suppose you would consider that the limit of taxation was reached the instant that any diminution in the consumption took place?—Certainly; as soon as any pronounced diminution in the consumption took place I should say that the limit of taxation had been exceeded.

3624. Sir W. Lawson.] Do you know the average consumption of salt per head throughout India?—It has been inquired into, and I think it was made out that the average consumption of salt per head was about 12 lbs.

3625. Mr. J. B. Smith.] That is for all India?—Yes.

3626. Sir W. Lawson.] Do you happen to know what the consumption is per head near the coast, where they can get it cheaper?—No. I am not myself cognizant of the details of those inquiries which were made after I left India, but only of the result of them; and the result was as I tell you, that, one man with another, they found that they consumed, on the average, 12 lbs. per head.

3627. It has been stated that, whilst where salt is cheapest, near the coast, the consumption is upwards of 20 lbs., the average was, a short time ago, under 10 lbs., showing that in considerable districts it must be as low as 5 lbs. Do you think that that is a fair statement?—No, I

do not think that it is a fair statement. I think it is an inaccurate statement probably, but it would be very easy to test it. The papers of the inquiry are forthcoming, and it would be very easy to see whether the inquiry was fair and complete, and whether the result of the inquiry was correctly stated or not.

3628. But if it were so, and if an article like salt were in some parts consumed to the extent I have mentioned, that would show that the consumption was restricted by the tax, would it not?—Distinctly.

3629. Mr. J. B. Smith.] But might it not so happen that the average consumption of salt on the coast, where there is an abundant supply of fish, would be affected by that circumstance?—They do not salt their fish much.

3630. Mr. Bourke.] I believe that it has sometimes been suggested in India that throughout our territories the salt-tax should be equalised?—Yes.

3631. Now, I apprehend from your evidence that you do not attribute much importance to that equalisation as a financial measure?—I do not know if you heard me say just now that I did not see why, the salt-tax being a poll-tax, the people of one part of India should pay a higher poll-tax than the people of another part of India, other things being equal. Therefore my tendency would be towards equalising. I do not mean that it is at present possible, but it is a thing to look at.

3632. Equalising it by raising it?—By raising it where it is low, rather than by lowering it where it is high.

3633. Would the equalisation of it have any effect in reducing the expenses at all with regard to the customs line?—It would depend a good deal upon how it was done. If the salt of Madras and Bombay could be brought up to an equality, or even nearly an equality with that of Bengal, you might take off a very large preventive line; the line that is now in existence between Madras and Bombay, and Hindoostan, you may say.

3634. Mr. Bouch.] There might be this reason, might there not, for requiring a rather larger tax to be levied in Bengal than in other parts of India, because in Bengal you have the permanent settlement existing, and therefore, it being impossible to raise a larger amount by means of the land revenue, it would be necessary to raise revenue by other means?—Yes; only that you cannot look upon the salt-tax in that local way precisely. If you put it in this way, that because the people of Bengal, by means of the permanent settlement, are more highly taxed or less highly taxed, therefore the salt-tax should be higher or lower in Bengal, I could answer the question; but putting it in that way, you put it as a general tax all over India, and I am not sure that I know the sort of answer that you would expect.

3635. When it is impossible to increase the land revenue in proportion to the increased prosperity of the people, it is necessary to make up the amount by some other means?—Yes.

3636. And the salt-tax having been generally stated to be an equitable tax, and not oppressive to the people, would it be fair to levy rather a heavier amount on the people of Bengal than on other parts of India, where it is possible to increase from time to time the land revenue?—I think that there is a great deal in that; and I think

think it is very probable that that very circumstance is the one to which we owe the difficulty in raising the tax in Bombay and Madras to an equality with that of Bengal. The people have a right to turn round and say: we are taxed as regards our land revenue more highly than you in Bengal, and for that very reason we cannot afford to pay a higher salt-tax. I think it very likely that in practice, if you came to push it, you would find yourself met with that difficulty.

3637. Mr. *Grant Duff*.] The recent raising of the rate at which the salt duty is levied in Bombay and Madras has not, so far as you have heard, excited any discontent?—Not the least that I have heard of.

3638. Some questions were put to Sir Cecil Beadon by the honourable Member for Brighton, which I think you heard, about the uncertainty of the opium revenue?—Yes.

3639. The Government of India is perfectly aware of, and has long carefully watched, the fluctuations of the opium revenue, has it not?—No doubt; it is a matter of too great importance not to watch it.

3640. But there are, are there not, two schools of financiers in India; one which considers that although the opium revenue will violently fluctuate in the future, as it has done in the past, it will never really fail us; and another which considers that the recent fall was a warning of a very serious financial danger about to come?—Yes.

3641. But you would say, I suppose, that we have hardly sufficient data to enable us to come to a very positive conclusion as to which of these two schools of financiers is in the right?—Well, I think that we have got data enough to make us look at the matter with the most careful attention. I myself look upon the prospects of the opium revenue to be very alarming; in that sense I am of one school rather than the other; I am of the school that anticipates the worst consequences as to the opium revenue from the increase of opium cultivation in China, and from the increased importation into China from Persia.

3642. What I wished to bring out was, that the two opinions are held, and both held by very able Indian financiers; that is the case, is it not?—Quite so.

3643. I suppose we do not know very accurately the statistics with regard to the production of opium in China?—No, but we have been informed upon the best authority what we could have resorted to; I think the words used by Sir Rutherford Alcock are, that it is an undoubted fact that the present amount of opium produced in China is very large, and that it is greatly increasing. He uses very strong language upon the subject.

3644. Have you formed any opinion as to the remarkable rise in opium in this very last year?—It is one of those things upon which it is extremely difficult to form an opinion at all; the price of opium is governed by so many considerations, the demand in China, the state of exchange, the money market, and a hundred and fifty things besides the opium crop itself. Generally speaking, we see that where the crop has fallen very low one or two years before, and the exportation from India has been consequently small, then, as we should expect, the demand and the price rise together in the following years, but it is not invariable, although that is the general rule, I should say, no doubt.

3645. What is the lowest point to which you

0.59.

recollect the opium revenue having fallen when you were in India?—I have seen it down at 700 rupees a chest, if not even a little lower. I find that it was 537 in the year 1838-39; that was the price in Calcutta, and for many years it was very low.

3646. Was there as much alarm about the opium revenue then as there has been recently?—No; but what has really created the alarm is the discovery of this production in China. It is perfectly clear that if the production in China should continue, and if they can contrive to make opium as suited to the Chinese taste as we do in India, we shall be beaten out of the field.

3647. Mr. Laing and Mr. Massey held the sanguine view about opium, did they not?—I think they did.

3648. And Sir Richard Temple, if I recollect right, has taken the other view?—He has taken certainly the other view.

3649. And you would say, I suppose, that the Government of India at home has expressed pretty much the view which you have expressed, in so far as it has expressed any view?—I think so.

3650. Sir *W. Lawson*.] But the consumption in China is also increasing very much along with the cultivation, is it not, so that there is a demand both for the Indian opium and for the home-grown Chinese opium?—Speaking for the finances of India, I earnestly hope it may be so.

3651. Is it the fact that the consumption of it is spreading immensely in China?—I suppose it is because a considerable quantity has been taken off in addition to this home cultivation, and the importation from Persia.

3652. Sir *J. Elphinstone*.] Was not the time which you mentioned, when the price of opium was so low, coincident with the time when Commissioner Lin seized the opium and burnt it?—That would not account for it, because in other years the same phenomenon occurs; it goes down again and then rises suddenly. Between 1850 and 1859, there are five years of extremely small prices.

3653. Mr. *Bowke*.] For how many years has the Persian opium been imported into China in large quantities?—In my day, I never heard of the Persian opium. It is a discovery of late times entirely. It is alluded to in a publication in Calcutta, a collection of papers relating to the opium question, in which all the information that exists regarding opium in China and Persia and elsewhere has been collected, and a great deal of correspondence and discussion upon the most interesting parts of the opium question; and it is from those that I have derived myself the knowledge which I possess about the Persian opium, which is very small after all.

3654. But it has only been within a very few years that the growth of Persian opium has disturbed our calculations with respect to price?—It is only within a very few years.

3655. And has the growth of the Persian opium been pretty well contemporaneous with the increase in the growth of China opium?—That I cannot say.

3656. When you speak of alarm with regard to our opium revenue, is that alarm produced by apprehensions which you may feel with regard to the growth of Persian opium, and the home China opium?—The Persia and the China opium are things that are just now staring us in the face; it may eventually come from other places,

from

Sir *F. J. Halliday*,
K.C.B.

5 May 187

Sir F. J. from Java, for instance; but those are the two
Halliday, things staring us in the face now.

K.C.B.
5 May 1871. 3657. But hitherto the phenomena that have
disturbed our calculations have been phenomena
over which we have had some control; we were
able to bring back the price?—Yes, by manipu-
lations in our own territory. But this is to a
great extent beyond our control. It occurs to
me that it may be indirectly within our control,
both the Persian growth and the China growth.

3658. Would you state to the Committee how?
—As regards the Persian growth it is, perhaps, a
very trite suggestion; but I think it would be
very obvious to put it into the head of the Per-
sian Government to inflict an export duty; it is
a suggestion that they would be very likely to
adopt, and it might do a great deal of good in
interfering with that trade, at all events limiting
it. Further than that, with regard to the China
production, I would first of all desire to have
more accurate information. What we have not
accurate information about is the difference of
quality between the China opium and our opium.
If the China opium is so inferior in quality, and
likely long to remain so, as that there will always
be a very large difference in price, I do not
think that it is likely to do us any harm for a
great many years to come, if at all; it is like
poor wine against good wine. But if it be the
case that they are improving in the cultivation in
China, and that soil and climate are likely to
enable them to make their opium as good as ours,
then I think that our position is very critical.

3659. Did I rightly understand you to say that
the opium raised in China is chiefly consumed in
China?—I believe entirely.

3660. Then an export duty in China would
have no effect on this question?—None whatever;
it was as to Persia that I suggested that. I
should say that there are some remarkable papers
towards the end of that book to which I have
already referred, which the Committee may not
have seen, which tend to show that the Chinese
Government are deliberately and wilfully, and
of set purpose, encouraging the growth of
opium in China, with a view to revenge them-
selves upon us, and to stamp out our opium re-
venue; that they are openly and avowedly doing
it with that purpose. And if they have that pur-
pose, they are a sharp and clever people, and they
may do us a great deal of harm.

3661. Mr. Lyttelton.] Does not the Emperor's
edict, prohibiting the growth of opium in China,
exist?—No, it has been specially dropped for the
purpose of meeting us, and putting an end to our
trade.

3662. Sir J. Elphinstone.] You are aware that
there was formerly a large import of Turkey
opium into China?—Yes, as was said by Sir
Cecil Beadon just now. He believed that that
Turkey opium was the same as the Persian
opium. I do not know enough to say as to that.

3663. It was, as a matter of fact, shipped at
Smyrna, and sent round the Cape?—Yes.

3664. That Turkey opium has disappeared, has
it not?—I do not hear of it now.

3665. It amounted to 11,000 chests, if I recol-
lect right?—Perhaps so.

3666. Do you know the provinces in which
this Persian opium is grown?—No, I do not.
However, in that book which I have alluded to,
but which I have not had time to go through
completely, you would find a good deal of infor-
mation upon all those points.

3667. Mr. Bourke.] Did the opium revenue of
last year exceed the estimate a great deal?—Yes,
very greatly.

3668. Can you give the Committee any reason
for that?—Well, the reason for that is really that
which is at the bottom of much of the difficulty
of our opium revenue altogether. You heard
Sir Cecil Beadon say that upon his advice the
Government had come to the determination of
bringing to market in Calcutta, every year, from
48,000 to 50,000 chests, so that the supply might
always be equal, and of giving out that they
intended to do all this, so that the public, and the
merchants in India, and in China, might know
that the quantity brought to market would
always be the same; and in order to do this,
he said that we had nothing to do but gra-
dually to collect a reserve of about 10,000
chests. This advice of Sir Cecil Beadon's
was followed; he retired, and went away to
England. The very first year that it was
attempted it broke down, for reasons which are
an answer to the question you have just put to
me. The opium agents are called upon at the
beginning of the season, say about April, to
estimate what the crop will be, and what the
out-turn will be for the season coming, and they
do it to the best of their ability, looking at the
acreage and the state of the crop, and so on. In
April of the year following this suggestion, made
by Sir Cecil Beadon, and adopted by the Govern-
ment of India, and highly approved by the
Secretary of State here, the opium agents reported
that they could with ease bring to market in this
season 48,000 chests; and, accordingly, the
Government notified to the public that they
would bring to market 48,000 chests of this
season's production. Luckily, they put in, "pro-
vided that such an amount be produced." In
July the agents were obliged to say that, owing
to hail-storms and drought, and one thing and
another, the supply, instead of being 48,000,
was not 38,000 chests. A great uproar arose
in Calcutta; and the merchants rose, not as one
man, but as half a dozen men, because each one
had a different opinion about as to what ought to
be done. Some said, "You must, somehow or
other, produce the 48,000 chests; if not out of
this season, you must take it out of the next
season" (which the Government can do, but it is
burning the candle at both ends). Others said,
"No, certainly not; if it is only 38,000 chests,
you ought not to produce more than you have
been able to cultivate." It ended, I think, in
the Government taking the amount out of the
next year, and, luckily, the next year was a
bumper; so that they were able to fill up the
vacuum. But that showed that Sir Cecil
Beadon's suggestion was, after all, impracticable.
The truth is that it is a singularly precarious
crop, and the slightest thing alters the con-
sistency of opium; drought, much rain, hail-
storm, wind—anything will alter it; and you
never can tell till the end of the season what the
out-turn will be; so that you are always liable
to have more than you wanted or less than you
wanted.

3669. Is there any powerful body of men in
India who really wish to see the Government
monopoly of opium done away with altogether, and
to substitute for it a general excise duty?—No; I
think that, if there was a powerful body of men
in India, or in England, who cared a bit about
it, it would be done to-morrow. There was a
powerful

powerful body of people who were determined to put down the salt monopoly. I am old enough to remember it in its full force, when the Government did its utmost to keep out the English salt, and the English salt dealers determined, somehow or other, to put down that monopoly. All sorts of frightful consequences were predicted as the result of putting it down; but the end of it was that the salt monopoly was put down, and the salt is much cheaper, and the people have a great deal more of it; and the result has been highly favourable, and it has quite falsified all the apprehensions of those officials who opposed it so long. No doubt they opposed it for honest reasons, but they turned out to be wrong. So with regard to the opium monopoly; if any great interest was to determine to put down this monopoly, for the sake of allowing that interest to get into, and to work it themselves, I have no doubt it would be done before long, whether the interest was in India or in England.

3670. Mr. *Grant Duff*.] Perhaps the Committee ought to have their attention directed to a remarkable paper of Sir John Peter Grant's, taking the opposite view on that subject?—I have a copy of it; but it does not take an opposite view.

3671. But a different view?—I do not think that Sir John Peter Grant would ever have differed from me in this, that if a great interest were to start up to meet the opium monopoly it would be put down. I am not saying that it would be right to put it down; but only that if the great English interests, for its own sake, were to determine to put it down, it would be put down.

3672. I do not understand then you to express an opinion against the opium monopoly itself?—No, I have expressed no opinion whatever.

3673. Mr. *Bourke*.] Do you object to express an opinion on that point?—Not in the least.

3674. Do you think, as a matter of financial policy, that it would be advisable for the Government to abandon altogether the growth of opium, and let the growth be free throughout the whole country, and then substitute for their former system a system of excise and export duty?—Well you know that is a very large question. There are three reasons, and only three, that have ever been given for keeping up the present monopoly; they are very powerful reasons; they are given in as forcible language as possible, far more forcible than any that I could employ, in a Minute of Sir John Peter Grant's, dated, I think, 1862, when this question was discussed. People are continually raising the question in India; it is raised and discussed and dropped, and raised and discussed and dropped at intervals continually. This was one of the raisings of this question, and Sir John Peter Grant was referred to naturally; he was then the Lieutenant Governor of Bengal, and he wrote a Minute on the subject, in which, as I have said, the reasons against making any alterations are stated most forcibly. The Minute itself should be before the Committee; it is at the command of the Committee, and is to be got at the Indian Office at a moment's notice. I will now simply summarise what Sir John Peter Grant has said, which the Committee can read more at length afterwards. His objections, though very tersely put, are the objections that ever have been put forward. There are three great and serious objections to putting an end to the system of monopoly in Bengal. One objection is, that you would not be able to

prevent a very large system of smuggling without an amount of preventive service and preventive operations, which would be very expensive, and very harassing to the people; that is objection one. Objection two is, that it would be followed (it is part of objection one) by an increasing consumption of opium amongst our own people. And objection three is the most difficult to get over of any. You see, as Sir Cecil Bendon has said, our receipts from opium in Bengal consist of two things: they consist of the duty, and they consist of the manufacturer's profit. The manufacturer's profit may be 300 rupees a chest, or it may be 400 or 200, but it is very considerable. Why, nobody asking for it, should we hand over that to anybody else? It is of enormous consequence just now to us. If we lost it we should have to impose to that extent, which means from a million and a half to two millions and a half additional taxation on the people, regarding which we are already at our wits end. And why, when nobody asks us for it, we should scatter that to the winds, hand it over to A. B. C., or give it up altogether, I am unable to see. As to the two first arguments, I am constrained to say that I see nothing in them. I think it would be perfectly easy to put down smuggling under an excise system, and that it would be done without any larger preventive service than we have now, or harassment to the people, and with that you would prevent the anticipated greater consumption by our own people. Therefore I attach no importance to those two objections. But to the third I attach the greatest possible importance, and until anybody can show me how that two millions or more can be supplied, I should think it a rash Government which would fling it away.

3675. With regard to those financiers who are in favour of doing away with the Government monopoly, do you know how they meet the difficulty which you have just suggested, that is to say, how they meet the difficulty raised by this great vacuum in our finances which would be caused by the abandonment of the growth of opium?—I should tell you, that lurking in my mind, after all that I have said, there is a doubt; and that doubt shows what would probably be said by persons who desire now, on grounds of political economy, simply to put an end to the present system; but this is the merest speculation, it would not do to act upon it at all. You see that we are now perhaps face to face with the destroyer of our opium revenue; it may be looming in the distance. If this home production in China and in Persia, and elsewhere, is likely to turn us out of the market, then what is the best chance we have of saving the market? Why the best chance of saving the market is to make as much opium as ever we can, and send it to China as cheap as we can. Mind, the first proposition is not established yet as a fact that the China production, or any other production, will supersede ours; that depends upon a great many inquiries which have not yet been made. But take that supposition, and then one would say, the only way to meet the case is this: as they have now a taste for our opium, do not let them get a taste for another; send as much as possible into the market; never mind its going into the market at a low price; by keeping up the price you are killing the goose that lays the golden eggs. So that I can conceive of a financier saying, far better save half than lose the whole, and perhaps, after all, you

Sir F. J.
Halliday,
K.C.B.

5 May 1871.

Sir F. J.
Hulliday,
K.C.B.

5 May 1871.

may save the whole, that is to say, let private enterprise go into the market and manufacture; private enterprise will be quite certain to double the exportation; the amount grown in India will be doubled or trebled; the amount sent to China will be doubled or trebled; let us hope that in this way you may recoup your loss, and if you do not, at any rate you save revenue which otherwise you may lose for good and all. There is a great deal in that deserving to be weighed before any one comes to a determination on the subject.

3676. But at present would you advise any alteration?—At present it would be most rash, on the information which we now possess, to make any alteration.

3677. Sir W. Lawson.] Do you happen to remember the date of the revocation of the Emperor's edict?—No, I do not; it is alluded to in those papers which, I think, would be in the hands of the Committee.

3678. It is within a year or two, I suppose?—Yes; it is said in those papers that the Chinese Government, to meet us, are encouraging the cultivation of opium to the utmost of their power.

3679. But that is modern?—Comparatively.

3680. Sir J. Elphinstone.] You are not perhaps aware that opium is a great necessary of

life in China?—I suppose in one sense it is; they cannot do without it, and they will not do without it. If we do not give it to them somebody else will; they will have it.

3681. Have you ever been in China?—No.

3682. You are not perhaps aware that the food of the Chinese requires a corrective, and that nature points out opium as the best corrective of the half putrid food that they eat?—No.

3683. You are not aware that dysentery and complaints of that sort, are more rare in China in consequence of the use of opium?—No.

3684. Sir D. Wedderburn.] Have you any acquaintance with the Straits Settlements?—I have been in them; I have not much acquaintance with them.

3685. There is a large consumption of opium there, is there not?—Half of the population in the Straits Settlements is Chinese; they bring their opium-consuming habit from China, and carry it on there. But I can bear this testimony, that they are a most remarkable population for industry and usefulness; the Chinese population of the Straits are one of the finest populations that I have had to deal with.

3686. And it is they who consume the opium, not the natives of the country?—It is they, not the natives of the country.

Tuesday, 9th May 1871.

MEMBERS PRESENT :

Mr. Ayrton.
Mr. Baring.
Sir Thomas Bazley.
Mr. Beach.
Mr. Birley.
Mr. Bourke.
Mr. Candlish.
Mr. Cave.
Mr. Cross.
Mr. Beckett Denison.
Mr. Dickinson.

Mr. Grant Duff.
Mr. Eastwick.
Mr. Fawcett.
Mr. Robert Fowler.
Mr. Hermon.
Sir Wilfrid Lawson.
Mr. Lyttelton.
Mr. McClure.
Mr. J. B. Smith.
Sir David Wedderburn.
Sir Charles Wingfield.

THE RIGHT HONOURABLE ACTON SMEE AYRTON, IN THE CHAIR.

Sir THOMAS PYCROFT, K.C.S.I., called in; and Examined.

3687. *Chairman.*] Will you be good enough to state what offices you have held in India?—I held various appointments in the Revenue and Judicial Departments, for the first 10 years of my service; after that I was successively Secretary to the Board of Revenue, Secretary to the Government in the Revenue and Judicial Departments, Chief Secretary, and then Member of Council at Madras. I retired from the service and left India in 1867.

3688. You are very cognizant with the mode in which the salt revenue has been collected in Madras, I presume?—Yes.

3689. Will you be good enough to state what has been the course of the Government of Madras in the levying of that branch of revenue?—In Madras, since 1805, the revenue has been collected through a monopoly. The sale and manufacture of salt are in the hands of Government. In the beginning of the season the Government contract with the manufacturers at the different salt works for the quantity of salt required, which is then brought into store by the manufacturers; it is stored on the Government platforms, and sold in due course to the dealers at the monopoly rate, which at present is two rupees a maund.

3690. The Government taking upon itself all the risk and expense of manufacture?—The manufacturers are bound to deliver certain quantities of salt at certain rates, and after they have delivered that on the Government platforms, then the rest is at the risk of the Government.

3691. *Mr. J. B. Smith.*] What was it before its present price?—One rupee 11 annas.

3692. *Chairman.*] Is that manufacturers' monopoly regulated by a statute in the nature of a regulation?—Yes, there are regulations which prescribe the course to be followed.

3693. And prohibit any person from manufacturing except with the license of the Government?—Yes.

3694. Will you state how the Government make those contracts for manufacture with the natives?—They determine for each salt work how much is required, and then they arrange with the salt manufacturers, giving each what they consider to be a fair proportion to manu-

facture. It is then produced in due time by the manufacturers and stored on the Government platforms.

3695. Do they set out a given quantity of land for each person? No; what they call the salt pans or salt beds, are already provided, and each manufacturer has so much belonging to him; on those he produces as much salt as is required.

3696. He is the owner of the pans?—Yes.

3697. Does he deliver the salt to the Government by weight or measure?—It is delivered to the Government by measure, and sold again by the Government, except for export by sea, by measure.

3698. And how is it sold when it is for export by sea?—For export by sea it is sold by weight, because it is usually taken to Calcutta, where it is sold by weight.

3699. When salt is exported, do the Government take any profit for the manufacture?—No, they put it on board for prime cost and charges.

3700. How do they fix the rates which they pay the manufacturers?—They vary according to custom.

3701. There is no competition?—No, there is no competition. The Government assign to each man how much he is to manufacture for them, and he manufactures accordingly.

3702. And do they fix the rate at which he is to manufacture?—Yes; that is to say the rate is the old established rate, usually speaking; it goes on from year to year.

3703. Can you state what the rates have usually been?—They vary so much that it is hardly possible to say; but I can say, generally, they vary from 5 rupees to 12 or 14 rupees by the garce, which is a local measure, equivalent to about four tons and-a-half. There are some rates over 12 rupees, but that is altogether exceptional.

3704. *Mr. J. B. Smith.*] Is the Madras maund the same as the Calcutta maund?—Yes; it is the Indian maund. The local maund varies, but not the Indian maund. The Madras local maund is only 25 lbs.

3705. *Chairman.*] Is that sold by the garce wholesale to the merchants?—Yes; it is sold either by the garce or by a measure, which is the four-

Sir
T. Pycroft,
K.C.S.I.

four-hundredth part of a garce. The small quantities are sold by the smaller measure, and the large quantities by the garce.

3706. Do the Government take any steps to distribute the salt throughout the Presidency, or do the dealers come to the place where it is made and buy it there?—The dealers come to the place where it is made and buy it there, and sell it where they can. There is one exception, that is up a river in Canara; the Government send the salt so as to meet the traders; they form a dépôt up the river for their convenience. That is the only exception. That dépôt is a few miles up the river, for the convenience of the traders, and to prevent them from having to come down to the coast.

3707. Mr. J. B. Smith.] Do they charge the same price to them as to those on the coast?—Yes, I think they do; but the cost of transport a few miles up by water is very small.

3708. Chairman.] Is there any salt that is found spontaneously evaporated on the earth or otherwise?—Yes; in some parts of the coast where the land is low the swamps are occasionally inundated by high tides; the water is then prevented from returning and allowed to evaporate, and that produces salt.

3709. Is that also collected under the system of monopoly?—Yes, that is collected and brought to the platforms. It is very good salt, and is stored in the same way.

3710. Is there any convention under which Government delivers a certain quantity of salt to the French Government?—Yes; the French Government have agreed not to manufacture salt or opium in the territories attached to their settlements, on condition of the Government making them an annual payment of four lacs of Sicca rupees, about 40,000*l*. There are no salt works in the French settlements. The British Government, therefore, supplies them with what salt they require for local consumption, and they then, on the other hand, are bound not to sell it below the Government rate.

3711. At what rate is it delivered to the French Government?—At prime cost and charges.

3712. Can you state what has been the growth of the salt manufacture under this system?—Not from the beginning of the system; but I can state what has been the increase during the last 20 years. I find that in 1850 the quantity sold (the manufacture varies in different years) was about 49 lacs of maunds. It continued to increase to the year 1868-69, when it was 67 lacs 5,865 maunds. The next year it fell off; but the reason of that was, that the price was suddenly raised from 1 rupee 11 annas to 2 rupees, and that for a time checked the sale.

3713. During the 20 years that you have mentioned, was there any change in the price of the salt?—Yes; in the first nine years of that series the price remained 1 rupee per Indian maund. It then rose in 1860 to 1 rupee 2 annas.

3714. What was the effect of that change on the sale?—The sale in the year in which the change occurred was 57 lacs 98,592 maunds. In the next year the price was raised again from 1 rupee 2 annas to 1 rupee 6 annas; but there was an increase, the sales for that year were 60 lacs 74,761 maunds. But I should mention that just about then the railway came into play, and there were about 200 miles of it open; I allude to the Madras Railway, which runs right across the continent.

3715. Do you think that that compensated for the increase of sale price, by carrying it into the interior?—I think so; because the sales continued to increase in spite of the rise in price.

3716. Can you state what quantity of salt is carried into the interior now by the railway?—In the last year, that is to say 1870, there were 17 lacs 31,844 maunds carried by railway into the interior.

3717. Do you suppose that that is carried now cheaper by railway than it was formerly?—Very much. The charge by the railway is a penny a ton per mile. It certainly would have cost 4*d*. or 5*d*. to carry by bullock cart.

3718. Mr. J. B. Smith.] That is to say, it is carried at one-fourth the price by railway?—Yes.

3719. Chairman.] Do you recollect that a report was made on the salt monopoly at Madras in 1856 by a Commission appointed in India?—Yes.

3720. Do you know whether the Government took that report into their consideration?—No, I do not think anything was done upon that immediately. In that report Mr. Plowden recommended that an excise should be substituted for the monopoly, and that is now being done; but I do not think that anything was done immediately, the thing lay over for a considerable time.

3721. What steps have been taken recently to give effect to that?—An Act has been passed by the Governor and Council of Madras, and has been sent to the Governor General, and I daresay by this time it has received his assent.

3722. Was that Act framed on the same footing as the law of Bombay?—Yes, much the same.

3723. So as to assimilate the two systems?—Yes.

3724. Have you considered the probable effect of that Act?—Yes; the effect expected from it is, that it will adapt the supply more nearly to the demand when the people are allowed to manufacture themselves, and there is free trade in that respect; and also that as the salt can be made at cheaper rates than the Government buy it at, and will be made at those rates, the purchaser will get the benefit of the difference. Then of course there is the general advantage of an excise system as against a monopoly in public estimation.

3725. Do you think, on the whole, that the community will be able to manufacture and sell the salt cheaper than the Government did?—I think they will.

3726. Can you explain why there has been so much delay attending the giving effect to the Report of 1856, which recommended that the monopoly should cease?—No, I do not know that any special reason can be given, except that things do often hang over. There was some little delay in connection with the Act, because the Madras Council first sent up to the Governor General an Act to which he objected on technical grounds; there were some provisions as to how the compensation was to be adjudged in case any was required, and to that he made some objections. The Act had to be sent back to be revised, and that caused some delay.

3727. Has it been the practice of the Government, under the present system, to keep any large store of salt?—They usually keep two years' supply in hand; they consider it safe to do so.

3728. Then

3728. Then the new system will start with that two years' supply?—Yes.

3729. What do the Government propose to do with that?—I have not heard what they intend to do. I do not remember seeing it mentioned anywhere. I should mention that the excise system will be introduced very gradually. It is to be tried in one district at a time, and so on.

3730. So that it will take some time to be worked out?—Yes, to be fully developed.

3731. Then, in the meantime, will the stock be sold off?—The stock will be sold off. The stock in the districts brought under the excise will be sold, I suppose, under some system adapted to the new mode of doing business. I do not know exactly how it is to be done.

3732. During this reduction of stock the revenue of the current year will get the benefit of the former years in manufacturing stock?—Yes, there will be so much on hand already paid for.

3733. So that there will be an advantage for the next two or three years in the revenue?—Yes.

3734. Which will not be experienced afterwards?—No.

3735. Have you heard any complaints as to the onerous character of this duty in some parts of the territory of Madras?—No, I do not recollect ever having heard any complaints.

3736. Do you know whether salt is used for any purposes except domestic consumption in Madras?—I do not know whether it is used to a small degree for salting fish; but I am under the impression that the fish are chiefly cured by being dried in the sun without salt. Salt is given to cattle occasionally.

3737. Is it not being used for any other purpose, as far as you know?—I do not know that it is used for any other purpose.

3738. Do you suppose that the cost of the salt at all affects the curing of fish?—No, I do not know that it does; the people cure their fish as they have cured it for generations, and I do not know that it is influenced by that. If they used salt, there would be the cost of the salt and of the labour of rubbing it in, and they would have to charge more for their fish; that would of course tell upon the consumer.

3739. But the expense of the salt would add considerably to the expense of any large industry of fish curing, would it not?—Yes, if the fish is to be thoroughly cured.

3740. Is there any trade in salt fish into the interior from the coast of Madras?—A great quantity is sent from the coast into the interior.

3741. Have you made any inquiries as to the extent to which salt is consumed by native families of different degrees in Madras?—I have made no special inquiry, but I see that there are very different estimates as to the amount that is used; some putting it at a high figure, and some much lower.

3742. Have you formed any opinion yourself from any investigation as to the rate of consumption of salt?—The opinion formed some years ago by the Board of Revenue when they were in communication with the Salt Commissioner, Mr. Plowden, was, that you might take 15 lbs. a head a year, young and old together. It seems to me that that is about a fair estimate.

3743. You mean throughout the Presidency of Madras?—Yes.

3744. Is any of the salt which is sent into the interior carried through the Madras Presidency

into native states, or into other presidencies?—It is carried through the Madras provinces to the native states, and consumed there. The Mysore State, and the Hyderabad State, both receive large supplies of salt from Madras.

3745. Is any drawback allowed on the export to those states?—No, they eat our taxed salt.

3746. Is any sent into any of the other presidencies by land?—Our Madras territory and the Bengal territory meet near the Chilka Lake, and the complaint of the Bengal authorities is, that our lower priced salt comes in and interferes with theirs, and therefore they have established a preventive establishment to keep it out.

3747. Does any come into any part of Bombay at all?—No.

3748. Is any account kept of the salt that goes out of the Madras Presidency by land?—No; the sales are classed as home and inland sales. That originated at the time when they had an inland customs system under which the country was covered with a network of custom houses, and the salt had to run the gauntlet of them all. Then the traders took out passes for home or inland consumption according as they meant to sell the salt within the district, or beyond it; and after reaching the place of consumption the pass was taken from them and sent back as a check to the salt works. That now is all over. The transit duties were abolished by Lord Ellenborough in 1844, and although the distinction remains in the accounts, yet it is not one to which much confidence can be attached. People may state that they are going to take their salt into the district, or beyond the district, but there is no certainty of their doing so, and the price is the same in either case.

3749. A division of the estimated quantity of the salt used by the number of the population could not give any accurate results?—It would only be approximate, and could not be relied upon.

3750. Do you know what it comes out as a mere division of that kind by the population into the quantity of salt?—We know our own population, but we do not know the population of the native states that consume our salt.

3751. Therefore no result can be arrived at?—No result that can be depended upon; no result at all, in fact.

3752. Can you state what are the assumed earnings of the lower class of the population in the rural districts in the Madras Presidency?—It is difficult to say. The agricultural labourers are paid in grain mostly; the quantity of grain has not varied, but the price has varied very much to their benefit; prices have risen very much indeed, and they get the benefit. It is difficult to say what are the money earnings. I can put it in this way, that an unskilled labourer on public works, or a railway, would get certainly a quarter of a rupee a day; seven rupees a month, perhaps.

3753. Is that general in all parts of the presidency, and the interior?—Where public works are going on.

3754. Do the Government pay as much as that for unskilled labour?—Yes.

3755. Then the charge for the salt tax does not fall very heavy upon a family?—I do not think it does; of course it falls on some more than on others.

3756. You have heard no complaints, I think you said, from the consumers merely?—No.

Sir
T. Pycroft,
K.C.S.I.
—
9 May 1871.

Sir
T. Pycroft,
K.C.S.I.
—
9 May 1871.

3757. Has there been any proposal to raise the duty to the standard of Bengal?—No, not to the standard of Bengal. The duty was raised in October 1869, in consequence of an application from the Government of India, when they apprehended a financial crisis. They applied to the Government of Madras to raise the price of salt, if they could do so. The Government assented, and the price was raised from 1 rupee 11 annas to 2 rupees.

3758. But there has been no proposal to bring it up to the higher standard?—There has been a proposal, I think, by the Government of India, or of Bengal; but not on the part of the Government of Madras; they have always opposed it.

3759. Mr. J. B. Smith.] Did that increase cause any dissatisfaction among the consumers?—I do not know that it did; but I was not in India at the time.

3760. Chairman.] Can you explain why the people of Madras are less able than the people of Bengal to pay the higher rate of duty?—I have never been employed in Bengal, therefore, I can only speak generally; but there are, I think, some considerations which would tend to show that the Bengal ryot is able to bear a higher rate of tax than the Madras ryot.

3761. Will you explain those considerations?—In the first place, I think I may say that the soil of Bengal is better, on the whole, than that of Madras. The climate is also better, that is, the rainfall is much more certain. I believe the rainfall in Bengal rarely fails; but in many districts of the Madras Presidency it is very precarious. Then in Madras, with the exception of Malabar and Canara, which, in their climate, as regards rain, resemble the Bengal Presidency, all crops that require much water have to be grown under artificial irrigation; they have to be irrigated from tanks and channels, and wells. Another reason is, that I believe the land assessment in Bengal is lower than that of Madras, and that food grain, generally, is cheaper there. A further reason is this: As I gather from a witness, who was examined here, the cost of transport did not, in his opinion, add much to the price of the salt in Bengal. Now, the cost of transport in Madras, before the railway was introduced, was very heavy indeed, and added very much to the cost of salt. From all those causes combined, I am led to think that *prima facie* the Bengal ryot may be able to pay more than the Madras one.

3762. Does the salt deteriorate much in quality on passing into the interior?—I think not. The Board of Revenue, some years ago, got samples of salt from 22 villages in the Cuddapah district, an inland district, and had it analysed by the professor of chemistry at Madras, and he reported that there was only three per cent. of impurities.

3763. Sir C. Wingfield.] You said that you thought there were considerations that would make one think that the Bengal ryot was better off than the Madras ryot, and therefore, was better able to pay a high duty on salt?—Yes.

3764. But it is held by a great many people that the peasantry, the cultivators of the land, where the ryot warez system prevails, as in Madras, are better off than where the zemindaree system prevails, as in Bengal?—I do not know what the position of the tenant of the zemindar is in that respect. I merely stated what seemed to me to be the natural advantages.

3765. The Madras cultivator of the soil is a freeholder?—Yes.

3766. In Bengal he is merely a tenant under the proprietor; the Madras cultivator ought, therefore, to be a wealthier man than the Bengal cultivator, ought he not?—That I think would depend upon what he pays for his land, what profit he gets out of his land. I do not know upon what terms the ryots in Bengal are towards the zemindars.

3767. A great proportion are tenants-at-will, and therefore pay a rack rent, do they not?—I was under the impression that Sir Frederick Halliday admitted that the assessment was lower in Bengal.

3768. But the proprietor, the zemindar, gets the benefit of the low rate of assessment; the tenant does not?—Well, I know nothing about the Bengal Presidency; but, of course, if it is not so, if the Bengal ryot does not hold his land on such favourable terms as the Madras ryot, that alters the case.

3769. But you are of opinion that the duty should not be raised higher in Madras?—No; I do not say that. It has been raised the other day, as I mentioned, from 1 rupee 11 annas to 2 rupees, that is, 5 annas. I think that the effect of that should be watched, and that the action of Government should be tentative; and if it appears that the ryot can pay that as well, without suffering at all, without any decrease of consumption, or any disadvantage of that sort, I do not see why he should not even pay more.

3770. Mr. Birley.] Are you of opinion that the excise system for collecting the revenue is better than the old system of monopoly, that it works more advantageously both to the Government and to the people of Madras?—I do not know that there is very much difference, but I think, on the whole, that the excise system is the better of the two. It adapts the supply more closely to the demand, and if the salt, as supposed, can be manufactured at a less rate, the ryot will get the benefit.

3771. At any rate, it leaves more scope for the exertions of the individual trader?—No doubt.

3772. Which is the more costly in collection?—They are much about the same. Perhaps the Government will hardly get as much on equal quantities under the excise as under the other, but there is not much difference.

3773. Perhaps the production and consumption may be greater?—It may.

3774. There will be more inducement to press sale, will there not?—Yes; the manufacturer will be induced to consult the convenience of the consumer.

3775. Chairman.] Can you state what the difference of the cost to the Government of the salt was in different parts of the Madras Presidency?—What the Government pay for it to the manufacturers I mentioned, is within the limits of 5 rupees to about 12.

3776. Were those different prices for different parts of the presidency?—Yes, different in different districts or different sets of works. As a rule the prices in the northern division of the presidency were lower than those of the south.

3777. Where the Government paid 12 rupees instead of 5, they deducted the difference from the supposed rate of duty, so that there would be a uniform price and rate of sales to the public under the monopoly system, I presume, or did they

they add the extra rupees?—When the Government had to pay 12 rupees a garce for their salt, and to sell it at the same, they realised less profit.

3778. The effect of the system was that the Government, out of what was properly revenue, was subsidising the manufacture in one part of the Presidency, to make it equal to the manufacture in the other parts?—They gave advantages to the manufacturers in some parts over others, and for that the people had to pay.

3779. The Government, in fact, confounded that what was properly revenue with the cost of manufacture to that extent?—Yes.

3780. Mr. Birley.] You spoke of the enhancement of cost by the transport and cost of carriage; have you any facts with regard to that which you can give us; can you tell us how much the cost of salt has been raised to the consumer by the great cost of inland carriage in remote districts?—If you mean by the old system of carts, it was reckoned by the Board of Revenue, when they were in communication with the Salt Commissioner, that a garce of salt rose in price one rupee for every mile it was taken. That would include the cost of carriage and the dealers' profit.

3781. It was tolerably uniform throughout the Presidency, I suppose?—Pretty well.

3782. Mr. Fawcett.] What would the price of salt be per maund on the average in Madras, suppose the duty was entirely removed and it was absolutely free?—I suppose it might be sold then for something under two annas a maund.

3783. That is an eighth of a rupee per maund?—Yes.

3784. And there is a tax of two rupees a maund now, is there not?—The present price of it, which includes the tax, is two rupees a maund.

3785. So that the tax at the present moment represents an excise duty of 1,700 per cent. upon the value of the article?—The excise duty will be fixed at 1 rupee 13 annas.

3786. But I want to get this out distinctly; you say that if there was no excise duty, and salt was produced perfectly free, it would be sold at 2 annas per maund, that is the eighth of a rupee; it is now sold at two rupees a maund?—Yes.

3787. Therefore, owing to the duty, the price is increased 16 fold, in other words, the duty represents a duty of 1,600 per cent. upon the value of the article?—Yes, that would be about the proportion.

3788. Can you tell me how much the duty realizes in Madras to the revenue?—I can give you the revenue for the last year which we have returned, that is 1869-70.

3789. That is after the duty had been increased?—Partly so; it was increased for about half the year. The gross revenue then was 1,164,730 £.

3790. What was the revenue the year before?—The gross revenue of the year before was 1,107,041 £.

3791. So that you increased the duty by 20 per cent., did you not?—Twenty per cent.

3792. And you say that you realized a half of that in the year?—Yes.

3793. Therefore your revenue ought to have increased by 10 per cent.?—The enhancement of price was introduced suddenly, and it had the effect of diminishing the sale for a time; it checked the sales. If the sales had continued at the same rate, of course the revenue would have been larger.

3794. But the point is this: the duty was 0.59.

raised 20 per cent.; you realized a half of that, according to your own estimate, within the year, therefore you may virtually say that for that year there was an increase of duty of 10 per cent.; but the increased revenue which you obtained, according to your own figures, does not represent an increase of 5 per cent., does it?—I have not calculated it.

3795. Will you just compare them if you please?—I think I understand what you mean, that the revenue did not rise as it should have risen, or in proportion to the enhancement of duty. No, it did not, because the introduction of the higher rate suddenly had the effect for a time of checking the sales.

3796. But will you kindly tell me, if you please, what was the increase of revenue; you have the figures before you?—The difference between the two years is the difference between 1,161,730 £. and 1,107,041 £.

3797. It represents an increase of $5\frac{1}{2}$ per cent., does it not?—Yes.

3798. Therefore you ought to have realised, if you had not checked the sales, an increase of 10 per cent. of revenue, but you only realised an increase of $5\frac{1}{2}$ per cent.?—Yes; but it is expected that the enhancement of price will show itself in the following year, if the people can stand it.

3799. (Chairman.) Was it in full operation throughout the whole of that year?—No, only half the year.

3800. Mr. Fawcett.] You increased the duties by 20 per cent.; that was in operation for half a year, therefore you virtually had an increase of duty of 10 per cent. operating throughout the year, and that ought to have realised, if it had not checked the sales, an increase of revenue of 10 per cent., but you only realised an increase of $5\frac{1}{2}$ per cent.; is not therefore the conclusion obvious that the increase of duty affected the consumption?—No doubt it affected the consumption for the remainder of the year. It is mentioned in the report of the Board of Revenue when sending up the statements that the sales fell off by 8 per cent.

3801. Therefore you may conclude generally, and it has been corroborated by previous experience, that as you raise the duty you affect the consumption?—You affect the consumption immediately; it is checked for the time, but it may increase afterwards, and has increased afterwards on previous occasions. The Madras sales have largely increased, in spite of the gradual increment of the duty or price.

3802. Can you give us any idea of the cost of collecting this revenue of 1,100,000 £.?—In the Government of India financial accounts you will find it stated that the charges, including the cost of salt, are 12.145 per cent., excluding the cost of the salt, it is only 2.774 per cent.

3803. So that the real cost of collection is only 2.774 per cent.?—Yes.

3804. Should you as a matter of general policy think it would be advisable to raise the salt duties?—I do not see any objection to raising them, provided you are certain that they do not injuriously affect consumption. That ought to be carefully watched.

3805. You do not think that a duty of 1,600 per cent. on the value of the article is too heavy a duty to be increased?—That would depend on what the effect is. If the effect were not found burdensome, I do not see but that it might be increased.

z 4

3806. I have

Sir
T. Pycroft,
K.C.S.I.
9 May 1871.

Sir
T. Pycroft,
K.C.S.I.
9 May 1871.

3806. I have no doubt that since your return to England you have carefully read intelligence from India; have you not seen in the local papers and other communications from India, repeated statements made of very grave complaints coming from the people of India in consequence of the policy of the rate of the duty on salt?—No, I do not think so. I have seen complaints about the income tax and other taxes, and very often when those complaints are made everything is thrown into them, but I do not recollect any special complaint about salt.

3807. Mr. Dickinson.] There are one or two maritime native states, I think, connected with Madras?—Yes, there are Travancore and Cochin.

3808. And do they manufacture salt?—They do. Travancore, the larger and more important state of the two, manufactures salt, and imports salt from Bombay.

3809. Do they import it into Madras?—Not from Travancore, but from Cochin; some comes across the frontier.

3810. Has Travancore only enough for its own consumption?—Yes.

3811. Is there any duty on salt imported from Cochin to Madras?—There is an arrangement between the Cochin and the Madras Governments that they shall charge much the same for their salt, and therefore there is not much that comes in.

3812. There is no arrangement at all with Travancore?—No; Travancore is shut off from the British territories by a wall of ghâts, in fact; and besides, the price in Travancore is the same as it is in the Madras territories, and there is no inducement to export it.

3813. Was there ever a manufacture of salt in Pondicherry?—A great many years ago there was a manufacture there, but it was given up in consequence of the arrangement entered into between the French and the British Governments.

3814. That was on the payment of 40,000 *l.* a year?—Yes; four lacs of Sicca rupees, about 40,000 *l.* now.

3815. Sir D. Wedderburn.] Do you consider that an equalisation of the salt tax throughout India would enable you to dispense with the customs' line between Hindustan and the lesser Presidencies?—We have no customs' line; it is in the other Presidencies.

3816. But do you think it would enable the Government of India to dispense with the customs' line if the salt tax were equalised?—I am not acquainted with the circumstances. *Prima facie*, I should say it would, but I have no knowledge of that part of the country.

3817. Is it invariably the custom to weigh the salt, or is it measured?—All salt sold for inland or home consumption is measured. If it is sold for export by sea they weigh it.

3818. And what is the reason for that difference?—The native feeling is in favour of measuring. They sell by the measure in their own bazaars, and they prefer measuring.

3819. But it is excessively uncertain as to quantity; by a slight difference in the method of measuring you may greatly vary the apparent amount?—Yes, by a sleight-of-hand a man can make some difference in the measurement, but it is seldom made to the disadvantage of the purchaser.

3820. Does not salt absorb a great amount of moisture in certain seasons of the year, and when

it is carried by sea, thereby affecting its weight very greatly?—I suppose it does, but that is a matter which concerns only the shipper; in fact, the Government sell him the salt, and he takes the risk of the market. He pays them the duty in Calcutta, and takes the risk of the market and what he can get.

3821. People are not supposed to suffer in any part of Madras from an insufficient supply of salt?—I do not think they are.

3822. But you said that the expense of transport was heavier in Madras than it seems to be in Bengal?—Yes; but then, on the other hand, the Bengal people pay much more for their salt.

3823. A former witness said that, regarding the salt tax as a poll tax, he did not see why, other things being equal, it should not be made equalised over India; I suppose the fact is, that other things are not equal, and that you can scarcely argue from one part of India to another?—I endeavoured to show some respects in which things are not equal. I may have been under a misapprehension as to one of them, the pressure of the assessment, but as to how far I am right in the others I do not know. Still, I think that circumstances should be taken into consideration in a matter of that kind.

3824. Mr. Beach.] For instance, the permanent settlement existing in Bengal would justify the authorities there in levying rather a heavier salt tax, perhaps, to make up for the want of raising the land revenue from time to time?—Well, as I understand, the ryots of the zemindars are very heavily rented; and if so, they could not afford to pay more for their salt: but I am not acquainted with Bengal.

3825. The land revenue of Bengal has not increased as it has in other parts of India?—It cannot increase, because it is tied down by the permanent settlement.

3826. Does much illicit traffic in salt prevail in Madras?—There was a good deal; but latterly the establishments have been revised, put on a better footing, and the servants better paid; and in most districts there is a deputy collector, a well-paid native, whose special charge it is to look after the salt. I think that these arrangements have had the effect of checking smuggling, but no doubt some goes on still. The salt pans are in an exposed situation, and the inducement to smuggle it is great, so that there must be some smuggling.

3827. Can salt be manufactured in Madras or imported at less price?—On the Coromandel coast it must be manufactured; it could not be imported except at a loss. Imported salt could not compete with the native manufacture, which is made very cheap.

3828. Mr. Baring.] Is it found that a rise in the rate of duty increases smuggling in salt?—I do not know that it does. I do not think that that would make much difference.

3829. So that lowering the rate of duty would not put an end to smuggling?—No, not unless it went very low indeed.

3830. Mr. J. B. Smith.] You attach great importance to the lowering of the rate of carriage of salt in consequence of the establishment of railways?—Yes.

3831. I think you say that it costs about 1 rupee per garce per mile to carry salt on the backs of bullocks?—In bullock carts.

3832. On the opening of the Madras Railway of

of 200 miles you have got it carried at 1*d.* a ton a mile?—Yes.

3833. That would be equivalent to a reduction of the salt duty to one-half, would it not, or thereabouts?—The price of salt remains the same, but the expenses decrease very much.

3834. That would be equivalent to a reduction of the duty by one-half?—It would decrease the price in proportion to the decreased cost of carriage.

3835. And that would be equivalent to reducing the duty?—Yes, it would be the same thing to the consumer.

3836. His salt would cost so much less; but if you were to put a duty upon it of one-half more, he would be in just as good a condition owing to the opening of the railway, as he was before?—Yes, if the two were made to vary inversely with each other, he would.

3837. Do you know whether Madras supplies the Central Provinces with any salt?—I do not know whether it goes to the Central Provinces. I should imagine that now, at all events, as they have a railway up to Nagpore, it must go from Bombay by rail.

3838. You do not know whether it goes up the Godavery?—It is anticipated that there will be a large quantity of salt sent up the Godavery when the Godavery works are completed, but I do not think they are opened to that extent: I do not think that any salt worth naming has been sent up yet; but it is one of the great recommendations of the scheme, that it will send salt into the Central Provinces by water carriage.

3839. If it be one of the great advantages of the opening of the railway that salt can be carried for 1*d.* a ton a mile instead of its present exorbitant price, would it not be a much greater advantage still if they could carry it for a farthing a ton a mile by the river?—No doubt. That of course involves the scheme itself, and its feasibility, if it could be effected. Then you have to put against that the interest of the money for opening the Godavery. It is not the mere cost of carrying it by the river, but you would have to add to that the interest on the sum expended for making the river navigable.

3840. But without going into that question, there can be no doubt that if any means could be devised by which a river could carry the salt at a farthing a ton a mile it would be an enormous advantage to the consumers of salt?—An immense advantage.

3841. Mr. *Lyttelton*.] Is there any importation of foreign salt into Madras?—No, no foreign salt; you do not of course allude to Bombay salt?

3842. No; I mean Cheshire?—No. There was an attempt to import it on one occasion; a cargo was brought to Madras, but at that time the duty was prohibitory; it was three rupees a maund. By some means, I do not know how, the Bengal duty, I fancy, crept into the Madras Act, and as it was not supposed English salt could ever be imported into Madras with a profit the thing was not noticed; anyhow, the duty then was three rupees a maund. When the captain came into the roads he found how the thing stood, and he was not able to land his salt or to keep it on board, as he had another cargo to take in, and he then applied to Government, and Government on that occasion took his salt off his hands at something more than they were accustomed to give to their own manufacturers. The salt was landed, but people got it into their heads

0.59.

that it had been manufactured in such a way as to affect their caste, and they would not buy it, and the result was that the Government, after keeping it for a long time, made it over to the Commissariat for supplying the European troops.

3843. What is now the import duty?—Now the import duty is to be on the same footing as the excise duty, 1 rupee 13 annas.

3844. There will be no possibility of foreign competition? Unless a man can import his salt with all charges at 2 or 3 annas a maund, that will be 9*s.* a ton, I do not see any possibility of it.

3845. Madras is able to manufacture salt not only for its own consumption, but also for the interior besides?—The manufacture might be extended enormously; as it is, there is a considerable traffic in salt from Madras to Calcutta.

3846. Since the abolition of the monopoly system, that has been extended, has it not?—The monopoly system has not been abolished in Madras, but in Calcutta Madras salt comes into competition with other salt; for instance, English salt and Bombay salt, they are all on an equal footing, they pay the import duty and get their own market.

3847. Mr. *Birley*.] What is the quality of that salt as compared with the Cheshire salt?—I do not know, chemically speaking.

3848. But is it as palatable; would it be as palatable to Europeans?—It is what Europeans eat all over the Presidency; they have no other.

3849. If they have no other, they eat that of course; but if they had Cheshire salt, would it be preferred?—On the occasion referred to, when this Cheshire salt was imported, I bought a small quantity for my own use; I do not know that I found any difference.

3850. *Chairman*.] Can you hand in a table, showing the production and duty on salt for the period which you have mentioned?—Yes.—(Vide Appendix.)

3851. Mr. *Grant Duff*.] Have you happened to hear, quite recently, of any importation of Cheshire salt into Madras?—I have heard that a manufacturer is sending out, or has sent out, a quantity of salt to Madras for sale.

3852. And the Government have given every facility for the trying of the experiment; I understand they have given a building for storing the salt, and every possible means for trying the experiment fairly, have they not?—Yes.

3853. *Chairman*.] In the accounts for the Madras Presidency for 1869–70, there is an item for “excise on spirits and drugs” of 570,000*l.*, what are the sources of revenue producing that 570,000*l.*?—It proceeds from the sale of the exclusive privilege of selling and manufacturing spirituous and fermented liquors in the provinces. The abkari in Madras does not apply to drugs, such as ganjah and bhang; there is no excise on them, and no interference with them; but the abkari revenue is thus realised in the provinces. The exclusive privilege is rented by districts usually, sometimes for one year, but sometimes for more; in fact, it is at present under a three years’ lease. Farms are put up to public auction, and knocked down to the highest bidder. He arranges with his sub-contractors, and they establish shops, at which spirits and fermented liquors are sold. The spirituous liquor in the provinces is country arrack, made of rice, and flavoured with spices and some bark of trees, and so forth. The fermented liquors are toddy from the cocoa nut on the western coast, and from the palmyra tree, or

Sir
T. Pycroft,
K.C.B.I.
9 May 1871.

from the date tree, on the eastern coast; that is the system in the provinces.

3854. Does the Government own any of the factories in which the spirit is made, or do they belong to the farmers?—In all the provinces the farmers distil for themselves in their own distilleries, but at Madras the Government have a distillery for country arrack, from which they supply the Madras vendors, and the town of Madras.

3855. Is there any limit on the price to be charged for the spirits by the farmer in country districts?—It is made a condition in the renter's lease that he shall not charge less than a certain rate.

3856. But is a maximum charge imposed, or is he at liberty to charge as much as he pleases?—He may charge as much as he pleases; the object is to prevent people getting it too cheap.

3857. Does the Government take any step to examine the shops at which he sells; or is he perfectly free in that respect?—No, the sites for the shops are all laid down in the lease, and he cannot establish any except in those places without further permission from the collector.

3858. The number of shops is defined?—Yes, the number of shops is defined, and their locale is defined.

3859. The village is defined, but not the particular house, I suppose?—No, not the particular house.

3860. With these elements before them, people are invited to compete for the lease?—Yes.

3861. Is there much competition?—Sometimes very brisk competition. In fact, it seems to be the impression that the competition last year was carried too far, and that the renters will suffer in consequence.

3862. What is found to be the result of the competition in arriving at the price; on what principle do they bid?—I suppose they know what have been the results of previous years, and they speculate what it will be, and take into account any circumstances of increase, such as public works coming in that direction when the labourers and navvies are likely to drink, and circumstances of that sort.

3863. Can you give us any information as to the general results of the price per head of the population; or otherwise?—Taking this revenue, 570,022*l.*, that distributed over a population of twenty-six and a-half millions, which it was by the last census of 1867, amounts to 5*d.* a head; but if you deduct from that 126,719*l.* for the Madras town and the adjacent district, where, of course, the consumption is per head much greater, it will come out about 4*d.* a head for the rest of the Presidency.

3864. Is it found that in the sums received from the different districts, that average price is obtained, or does it vary very much in each district?—It varies in the different districts. I have not made a calculation, but the prices obtained for the farms in the different districts vary, and not always, I imagine, according to the population.

3865. Has any inquiry been made to know why those variations take place, and what the cause of them is?—I am not aware that there has.

3866. Is it from their being large and more active towns?—That would influence it, of course.

3867. Does that include the supply of the spirit to the troops, or is that entirely separate?—

That is a separate concern; that is in the hands of the commissariat, that is the military abkari.

3868. That is not bought at these farm distilleries then?—No; the commissariat are supplied with liquor for the canteens and other places from the head quarters at Madras.

3869. How does the Government regulate the selection of the places at which the sale is to take place; is it on the application of the inhabitants to have a place established, or on what principle do they fix the site of the retail shops?—They are fixed according to where the demand is likely to be. Practically, I imagine, they are where they have been for a great many years past. Only when from circumstances it seems likely that a demand will spring up in any particular quarter, application is made, and that is inserted as one of the shops.

3870. But is it done entirely at the discretion of the collector or officer of the revenue?—Yes; he reports everything to the Board of Revenue; but unless it so happens that one member of the Board of Revenue is intimately acquainted with the district, practically it is much left to the collector himself.

3871. Is the spirit uniformly manufactured within the district, or are there any larger manufacturers which supply the different districts?—No; it is made within the district generally. I know an instance in which the manufacturer was a European owning large sugar works, and distilling large quantities of rum, and he took the rent of the district for the purpose of selling his liquor, making it take the place of arrack. Whether he supplied other renters in the adjoining district I do not know, but I do not suppose he did.

3872. There is no obligation on the farmer to manufacture his own spirit, I presume; or is there any restriction on the transit of spirit about the Presidency?—He might import his spirit from a distance, but it would be under precautions, so that it should not be tapped on the way, that it should not interfere with the renter through whose farm it came.

3873. But would the excise officer interpose, for the purpose of watching any such movement?—I do not know that it ever happens, but supposing it did happen that a party got liquor from Madras for the supply of his farm, in place of manufacturing it himself, the liquor would be carefully watched in transit, so that it was not sold in transit to the detriment of the farmer through whose farm it came.

3874. Can you state whether the revenue from this source has increased?—It has increased. I have got five years here; in 1865-66 it was, in round numbers, 414,000*l.*, then 427,000*l.*, then 506,000*l.*, then 490,000*l.*, a slight falling off, and now 570,000*l.*, and that will be the demand for three years, for the farm is rented for three years. This includes the Madras town sales, which are conducted on rather a different principle.

3875. Will you explain the principle in the town of Madras?—In the town of Madras the shops are rented separately; there is no rental for the whole town, but each shop separately; and in Madras the Government have their own distillery, and all the native spirit is supplied from that. The shops in Madras also sell the Columbo or Ceylon arrack, and that is imported by the Government to Madras, and supplied to the retail dealers.

3876. Can you explain on what principle the Government sells the arrack of the Presidency

dency with regard to the revenue?—The regulation prohibits their making a profit of more than $3\frac{1}{2}$ rupees a gallon; nothing more than that.

3877. Then they add that to the cost of manufacture to the Government?—Yes, in the case of country liquor.

3878. But in the case of liquor sold in the town, how do they fix the rate at which it is to be sold from the distillery to the retailers; is it by adding the $3\frac{1}{2}$ rupees to the cost to the Government?—Yes; the $3\frac{1}{2}$ rupees is the maximum that they can charge. I do not know that they always charge so much, but whatever it is it is added to the cost of production.

3879. Do they sell it at an upset price?—No, they do not sell the liquor at an upset price; they sell the shops.

3880. How do they fix where the shops are to be established in the town?—By consideration of where they are most wanted, and police considerations where they will be most effectually watched, and considerations of that kind.

3881. Is that done by the Board of Revenue, or by the police magistrate?—They both combine. The collector for the town of Madras has only revenue functions; the police and the magisterial authority are in other hands, so that the Commissioners of police grants his license for the shops as well as the collector, and he would have a veto in case of anything objectionable.

3882. And are they sold by auction, or how is the price fixed for the retail licenses?—The shops are sold by auction.

3883. But does the house belong to Government, or how is the house fixed?—No, the house does not belong to the Government; the man finds his own shop as he can, like public-house here.

3884. Then do you mean that the auction takes place first, without reference to the shop at which the retail is to be carried on?—No, it is known where the shop will be, and then the privilege of selling liquor at that place is sold.

3885. But how can it be known where the particular shop is to be?—The particular shop is sold; that is to say, an offer is invited for a shop, which probably has been established a great many years, situated in such a place.

3886. Then, if the Government is not the landlord of that shop, how can they sell by auction the right of retailing in the shop?—The man himself makes his own arrangement there; if he cannot get the shop, he will get some other shop near it. I do not know that it is always exactly the same shop or house; but the renter settles that himself.

3887. What is sold is the right to sell it at a shop in a particular locality?—Yes.

3888. But not at any one given shop?—I think the shop itself is prescribed; I am not sure whether the actual locality or street is fixed, but I think the locality is settled as nearly as possible.

3889. What I want you to explain is, how there can be any competition in selling the shop when nobody can get the shop except one person?—If he cannot get the shop, he gets some place near; he arranges for that.

3890. Do you know practically yourself whether there is a considerable competition for the right of retailing in the town of Madras?—I have never had very much to do with it; but I think there is competition.

3891. Do you know whether the price of a

0.59.

shop bears any particular relation to the number of the inhabitants, or how it is arrived at; how it is estimated?—It is estimated by what the party chooses to give for it.

3892. But upon what basis do they compete; is it upon their knowledge of the profits of previous years in the shop?—Yes, I imagine so.

3893. Can you state what proportion it results in of revenue per head of the population in the town of Madras?—I have got the figures; but I have not worked them out. The population of the Madras town and suburbs, and the district round, which is all clubbed together in the account which I have got from the Board of Revenue, is 1,274,000, and they pay 126,719.

3894. Is that apart from the profits of the Government distillery; is that paid for the sale of licenses?—That is for both; that is all that the Government get for the abkari, in fact, of Madras and its suburbs, and the inclosing district.

3895. You cannot state how much is obtained from the distillery, and how much from the shops?—No; I cannot tell that.

3896. Do you know what the effect of this system is upon the population of Madras in the town and country, in stimulating the drinking of spirits?—No; I do not know that it has any particular effect one way or the other. Of course the renter will sell his liquor if he can, but the Government has complete control over him; he is bound down strictly by the terms of his license and he is subject to heavy penalties if he violates them.

3897. But does he take any means to stimulate the people to drink?—I do not know any special means.

3898. Is drinking carried on to any extent upon his premises; does he deliver out his spirits to be drunk, or does he provide any means for drinking on the premises?—I do not know very much about the trade, but I do not think that people come, as they do in England, and sit down and drink for a long time together. They may come there and drink or they may take their liquor home and drink; except that some of the Madras shops may be different.

3899. Do you think the increase of revenue is to be ascribed to an increase in the consumption of spirits or to an increase of price?—I do not know that the price of the liquor has increased. I imagine that it is due to increased consumption.

3900. What are the classes chiefly who consume these spirits in the presidency?—The lower classes.

3901. Of all castes?—Not the higher castes; but the lower castes of labourers and people employed on public works; the lower class of menial servants, and people of that kind.

3902. Do you think the consumption is more in the towns than in the rural districts?—I think it would be.

3903. Is that consumption likely to go on increasing, do you suppose, or is it likely to remain stationary?—I suppose the consumption arises from the improvement in the condition of the people and the rise of wages, and if those continue to advance, I suppose there will be more liquor drunk and a larger revenue gained.

3904. Can you state generally what are the conditions which forfeit the license and by which they are kept under restraint?—Yes; if there is any adulteration of the liquor, or if the man har-

A A 2+

Sir
T. Pycroft,
K.C.S.I.

9 May 1871.

hours

Sir
T. Pycroft,
K.C.S.I.

hours bad characters, or allows any disorderly practices and things of that kind, and if he sells liquor below the stipulated rate.

3905. Mr. Dickinson.] Is any spirituous liquor of the same character imported into Madras?—If you mean for the supply of the population, the liquor imported for their supply and supplied through Government to the retail dealers, is arrack from Colombo in Ceylon.

3906. What becomes of the other liquors, European liquors?—They are imported for the consumption of Europeans.

3907. And do not these licenses include European liquors?—No, they are only to sell any country liquors; they are allowed, I believe, to sell small quantities of the other, a bottle of brandy, or something of that kind.

3908. And is any arrangement made with regard to the sale of European liquors?—Those are sold in English shops, and licenses are taken out by the Europeans for the sale of these liquors.

3909. And does not that license come under this head of the revenue?—I suppose it would be carried to account under this head; I am not quite sure, but it would not be much.

3910. Does that arise simply from the habits of the people, who merely consume the native spirits; or does it result from the state of the law, which interferes to prevent their consuming European spirits?—No; they consume the country spirits and the Colombo arrack because they have been accustomed to consume it, and that is their taste. They might buy, and, in fact, some of the natives do buy, brandy, and so forth, in the English shops.

3911. But that is not sold in the same way by retailers on the premises?—The English shops cannot sell less than a certain quantity; I think it is half-a-dozen of brandy, or something of that kind.

3912. Could any other shop sell those European spirits?—I think that the retail vendors are allowed to keep English spirits, but there is very little demand for it.

3913. Is there a prohibition against anybody but a license holder selling European spirits?—Yes; shopkeepers can only sell those spirits in quantities of, I think it is, half-a-dozen bottles.

3914. Is it the same as to wine?—Yes.

3914*. As regards the Colombo arrack, that does not pass through the custom house at all, I suppose, being imported entirely by the Government?—It does not pay duty.

3915. It does not appear in the custom house accounts, I mean?—I am not sure how that is. Of course it is the same thing, for it is imported for the service of Government. I think it would appear in the Custom House Returns of imports, not perhaps in the Custom House Returns of duty.

3916. But could a private dealer import Colombo arrack?—He could only import it to sell it in certain quantities.

3917. If he imported it he would pay the customs duty?—Yes.

3918. If the Government import it do they pay customs, as it were, or do they simply import it free of customs, so that goes into the abkari accounts?—I cannot tell. I do not know whether the duty is entered in the return of the custom house duties, or whether it is passed free and appears only in the abkari returns.

3919. As regards the arrack consumed by the troops, does that in any way appear in the

accounts?—I am not able to say. The commissariat import it from Colombo and store it.

3920. Do they pay duty on the import?—I cannot tell.

3920*. And you do not know whether the army is supplied with the arrack free of import duty or excise duty?—No, I do not know how that is; that is a military question. I should imagine that the commissariat did not pay duty; there was no actual payment, I should imagine.

3921. Do you know that there is an allowance for the troops, every man so much arrack?—I believe in the canteen there is something of the kind; they are allowed so much, but of late years they have taken beer instead. I believe they are allowed so much arrack, or in lieu of it so much beer.

3922. What is the duty on Ceylon arrack imported?—I suppose the duty on Ceylon arrack would be the same as on any other spirit. It is 3 rupees the imperial gallon; this is on spirits generally, and the duty to be rateably increased as the strength exceeds London proof; and there is an exception in the case of methylated spirits, and so forth. Imported by private parties, I suppose it would pay that duty.

3923. I understand the general result of your statement with regard to the country districts to be, that a manufacturer of spirits must retail his own manufacture?—Yes; he manufactures for the supply of the people of the district.

3924. He has no other market than his own licensed shop?—Yes; he distils the liquor specially for them.

3925. He has no manufacture of liquors to sell to retailers not being in shops for which he does not hold a license?—No; he distils the liquors for them, and they get them from him and no other person.

3926. I mean that the manufacturer has no general market of licensed dealers for the purchase of his manufacture of spirits, but it is confined to his own shop?—It is confined to the shopkeepers of his own range.

3927. (Chairman.) Will you state about what is the size of the area of each separate farm?—The area of the farm is a district generally. The districts are rented district by district. The Madras districts vary from 4,000 square miles to 12,000.

3928. You mean a collectorate?—Yes; they call them districts. The collectorates vary very much in size, being from 4,000 to 12,000 square miles; they are very much larger than the districts of some of the presidencies.

3929. Sir D. Wedderburn.] From what substances do they distil the spirit in the Madras Presidency?—The country arrack is distilled from rice, it is flavoured with various ingredients.

3930. Is there a great consumption of fermented liquor among the natives of Madras?—A great deal of what they call toddy, that is the juice of the cocoa nut, or date, or palmyra tree. It is harmless when first drawn, but fermented it becomes intoxicating, and in that state it is drunk.

3931. Have you any tax upon the toddy-producing trees?—The trees are taxed sometimes singly, and other times in groves.

3932. At what amount?—It varies very much in different districts.

3933. Is that included in the abkari revenue?—No, the rent of the trees would be, I think, included in the land revenue.

3934. *Mr. Beach.*] Do these licensed dealers adulterate their liquor at all?—I have not heard many instances of their doing so, they may do it; I have not heard many complaints of that kind in the provinces. Something of that kind goes on in Madras with the petty shopkeepers. They buy at the Custom House bad beer, and things of that kind, and they doctor it up. I do not know that the retail dealers adulterate their liquor much.

3935. From competition, one with the other, I mean?—You see that the renter takes a whole district, and then he divides it out among others, and their ranges are pretty well defined. I have not heard much of adulteration taking place. It is not easy to say, because it is not easy to detect.

3936. Does drunkenness prevail to any extent?—The revenue from spirituous liquors has increased, and I suppose to some extent drunkenness with it, but I do not think there is very much drunkenness. I think the average per head shows that there cannot be very much drunkenness prevailing.

3937. That is, if it is drunk generally, or if it is drunk to a large extent by particular individuals?—I do not think that there is very much increase in the intoxication. I think there is more drunkenness than there was, but I do not know of it to a very large extent.

3938. *Mr. Fawcett.*] Do the shops also retail opium for smoking?—No, that is not part of their *farm*, and I never heard of their doing it.

3939. Are there any opium-smoking shops in Madras?—No, at least there are no licensed shops. There may be shops where people can get opium to smoke. The privilege of selling opium is not part of the Madras *abkari* at all.

3940. *Mr. Beach.*] Would the system be better, in your opinion, if the licenses were given to the sellers direct, than to one person who took the whole trade?—It has been generally found more convenient to deal with one man, a man of some capital, than to have many small dealers. I do not know that, as far as the people are concerned, there would be any difference.

3941. *Sir D. Wedderburn.*] In the account of the revenues at present in Madras, there is no allusion to opium, either in the *Abkari* department or anywhere else?—No, there is no revenue derived from it at all; the *abkari* is simply confined to spirituous and fermented liquors.

3942. *Mr. Dickenson.*] Including tobacco?—No, not tobacco.

3943. *Mr. Grant Duff.*] You have said that the *abkari* revenue is rising; do you think that it will continue to rise?—I imagine it will with the increased prosperity of the people, the rise of wages, and so forth.

3944. You cannot trace any particular mischief to the present system?—I do not see any beyond what is incidental to all systems of taxing liquor.

3945. You are fairly satisfied?—Yes.

3946. *Chairman.*] Have you heard it stated that the population of Madras, as regards temperance, has very much deteriorated since this system has been introduced, as compared with what it was in former times?—This system dates from a great many years. Do you mean in the olden times of the natives?

3947. Yes?—I have heard it said that drunkenness is on the increase as compared with the native days, and I suppose that it is on the in-

crease in this way, that people get better wages, and spend more in one of the few luxuries they have to spend it in.

3948. But have you heard it stated that the actual physical condition of the population of Madras in some parts was seriously deteriorated in consequence of the consumption of spirituous liquors?—I do not think that I ever heard that said. There is a strong feeling in some quarters against the sale of liquors, and against the abuse of liquors on the part of the natives, but I do not remember its having gone so far as to say they have physically deteriorated.

3949. But with regard to their condition of life, and their comfortable means of life for their families, is there not an assertion that it is very much deteriorated by the sale of intoxicating liquors, and their addiction to the use of them under this system?—It may be said, perhaps, but I do not know that it rests upon any foundation.

3950. Have you not heard any complaint that the system of putting up to auction the morality of the people in this way, leads to the persons who succeed in the auction stimulating consumption by all the means in their power, and thus becoming active agents to demoralise the people?—It is said that the persons who buy the shops must make their money by them, and therefore it is their interest to use what means they can to bring about drinking. But that would be the case, I imagine, with anybody who keeps a shop of any kind. He would do what he could to sell his wares, whether liquor or anything else.

3951. Supposing a person opens a shop without having first been subject to an active competition as to how much he was to pay for it, would he be under the same pressure to stimulate the consumption of his commodity as if he had been subject to such competition?—Perhaps not, but still his interest would be to sell all he could.

3952. Do you think that the previous competition acts as a stimulus and pressure upon him to increase the sale?—Of course he must realise what he has given for the rent.

3953. Is it the fact that there is any reason to suppose that gambling is carried on in these houses?—It may be in some of the houses of Madras, and perhaps in some of the larger towns, but not, I think, beyond that.

3954. Do you suppose that that is used as a means of keeping the people in the houses drinking, so as to promote the sale of the liquor?—I have not heard of anything of the kind. I do not know whether it is so.

3955. *Sir T. Bazley.*] I presume there is no restriction upon the sale of intoxicating liquors?—It is part of the agreement of the vendors that they shall not allow drunkenness in their shops.

3956. Have they licenses for the sale of it?—They have licenses for their shops.

3957. *Mr. J. B. Smith.*] Are spirits drunk by women in India?—To some extent they are. I think they drink fermented liquors more than spirits.

3958. Is drunkenness prevalent among them?—It is among some of the lower class.

3959. *Chairman.*] Do you know at all what was the amount of revenue raised many years ago from this system when first it was introduced?—No, I do not know what it was then; the population was much less than it is now.

Sir
T. Pycroft,
K.C.S.I.
9 May 1871.

Sir
T. Pycroft,
K.C.S.I.
9 May 1871.

3960. You have never been able to ascertain the amount of the consumption of intoxicating liquors by the people before the Government introduced this system?—I hardly recollect from what time the present system dates. It must be many years ago, as long ago as 1812. Then there must have been something of the kind before that, from the time of our assumption of the country. What was the condition of the people before then in this respect I cannot say; probably a Hindoo or Mahometan government would be more severe on its subjects for indulging in intoxication than another government.

3961. Is there any particular import duty levied upon opium into the Madras Presidency?—We never hear anything about opium there.

I have looked at this return, which is the alkari for all India, but we never hear about opium. I think there is a special Act by which it is prohibited altogether. The export without a pass is prohibited I know; but I have an idea that it is altogether prohibited.

3962. Do you know whether the growth of opium is prohibited in the Madras Presidency by law?—I am not sure that there is any law upon the subject; but we never see anything of it. It cannot be exported without a pass, which is never granted; and I suppose that operates to prevent the cultivation to any extent.

3963. Is there any law prohibiting the cultivation?—I think there is an old law upon the point, but I have never had occasion to refer to it.

Sir CECIL BEADON, K.C.S.I., again called in; and further Examined.

Sir
C. Beadon,
K.C.S.I.

3964. *Chairman.*] I FIND in the accounts of the Bengal Presidency a sum of 689,000*l.* for "excise on spirits and drugs" for 1869-70; will you be good enough to explain in what manner that revenue is assessed and collected?—It is derived from the consumption of spirits and fermented liquors, opium, and ganjah or hemp.

3965. First, with regard to the opium, I think you have already explained to us the circumstances under which that is collected. Are the shops that retail it licensed, and is there one license granted for retailing all these commodities, or are separate licenses granted?—Separate licenses are granted for each description of intoxicating liquor or drug. Sometimes one license covers the whole, but they must be specified.

3966. One person takes out licenses for more than one commodity?—Sometimes.

3967. Then will you explain how the excise on spirits is levied?—There have been material changes in the management from time to time. Previous to 1840 there was a double system; one was the system of farming, and the other the system of Sudder distilleries. A Sudder distillery consists of a large area inclosed by four walls, in which all persons who desire to make spirits after the country process are obliged to distil their liquor. The duty imposed upon the liquor distilled in the Sudder distilleries is taken at so much per gallon when the spirits are removed from the distillery, and they are then supplied to retail shopkeepers within certain limits, those retail shopkeepers also paying a license for the sale of such spirits.

3968. How were those licenses granted to the retailers?—Those licenses were granted by the collector of the district.

3969. Upon what principle?—Any person who wished to take out a license could apply to the collector for such a license, and then before he could open his shop, he would also have to get either a second license or that license endorsed by the magistrates.

3970. How was the payment for the licenses regulated?—The license was at so much a day.

3971. A fixed charge?—A fixed charge of so much a day for each shop.

3972. Were any conditions attached to the license?—Yes; the collector's license simply provided certain conditions against smuggling. The magistrate's license provided that the shops

should be shut by a certain hour; that there should be no gambling, no improper character about, and other conditions of that kind.

3973. All the retail shops in a certain area were bound to obtain their liquor at the Sudder distillery?—Yes.

3974. What was the rate of duty charged at the Sudder distillery, when the two systems were in force?—In those days that I am speaking of, previous to 1840, I think the duty was one rupee a gallon. I do not think that it exceeded that.

3975. Was the liberty to manufacture within the area of the Sudder distillery granted to any applicant, or put up to competition or otherwise?—It was granted to any applicant; the only thing was that he had to pay a rent. He put up a still inside these walls at his own expense, and had to pay a small rent for the portion of land that he occupied, a few square yards.

3976. The revenue was entirely derived from the duty?—Yes, entirely.

3977. What was the other description of farming?—These Sudder distilleries were confined to what were called the Sudder stations, that is to say, the principal station in each district where the population was dense and the European officers resided. The rest of the districts were farmed. Sometimes a whole district was farmed to one farmer; sometimes it was divided into convenient divisions, and each division farmed to a separate farmer.

3978. How was the farmer appointed?—The farms every year were put up to public auction.

3979. Then was he to manufacture his spirit, or to get it?—He might get it where he pleased, or manufacture it himself.

3980. Then what did he purchase as a farmer; did he purchase the liberty of retailing?—He purchased the liberty of distilling, or selling wholesale, or retailing and opening shops where he pleased; and in fact, the whole country was given over to him to supply with drugs and spirits as he pleased.

3981. He had an exclusive monopoly of the manufacture and sale of the commodities for which he took out his license?—Yes.

3982. Was that granted to him by competition, or on what principle?—By competition.

3983. On public notice, I presume?—Notice was given of the time at which the farm would be put up to auction; and anybody might come forward and bid, and it was usually granted to the

the highest bidder, provided that he could give sufficient security.

3984. Was there much competition under that system?—Sometimes there was, but it very frequently happened, particularly where whole districts were made over to one farmer, that the abkari of a district fell into the hands of a capitalist, and when the time came for re-letting the farm, nobody was found to compete with him; in that case the Government was at his mercy.

3985. In such a case where there was no competition, did the Government fix an upset price?—No, because there was no alternative; they must realise their revenue, and the only way by which it was then thought that the revenue could be realised was through a farmer.

3986. When was a change made from this system?—In 1840 a change began to be introduced, but it was only gradually extended; it began in some districts in Bengal, but it was not for some time extended to the whole of the province. The farming system was discontinued, and the Government put itself into the position of the farmer, and collected the abkari revenue by means of an establishment.

3987. How was the liquor itself supplied under the new system?—Under that system those parts of the country which were not supplied from the Sudder distillery were supplied in this way. A person might take out a license for a shop for the sale of liquor at so much a day, to supply a certain district, and he distilled his own liquor.

3988. Was he bound to distil his own liquor, or did he purchase it, if he pleased, at any other place?—He might purchase it from another distiller, but there was no payment of duty, the duty was realised entirely from the license; in that respect there was a marked distinction between the system at work at the Sudder distilleries, and the system at work in the rural districts.

3989. In the one case the retail licenser paid the whole of his duty on his license, and in the other the whole of the duty was collected on the spirits?—Nearly the whole of the duty; there was also a license duty there, but much less.

3990. Was there any system laid down for granting retail licenses, or were they granted to any person that applied under the new system which you have described?—Practically, there was no restriction; anybody might apply for a license; and if the officer of the excise department considered that he was a man of substance, and would be able to pay the daily tax which he proposed to pay for opening the shop, the license was given to him.

3991. Can you state what the daily rate was?—It varied immensely, down to a farthing a day.

3992. Upon what principle was there a variation?—It depended upon the extent of custom which each shopkeeper expected to have.

3993. But who assessed the amount of daily pay for the license?—A man came forward and said to the Excise officer, "I want to open a spirit shop." The Excise officer would ask him, "How much are you prepared to pay?" "Well," he would say, "there are very few people living in the village, I cannot afford to pay you much, but I will pay a farthing a day;" and the Excise officer would say, "No, it must be a half-penny;" and it was a matter of bargain.

3994. Supposing one person having taken out

a license, another man wanted one for the same village, what was done then?—It was understood that the man who opened a shop had a monopoly within a certain limited area.

3995. It was an implied part of his bargain that nobody else would get a license within that area?—Yes.

3996. In point of fact, the rate per day paid for each license depended upon the number of inhabitants and the probable consumption within that area?—Exactly so.

3997. Then, did this give rise to any complications or complaints as to different licensed parties that one was encroaching upon the other?—Very frequently.

3998. On what principle was that adjusted?—I think each case was adjusted upon its own merits.

3999. Can you state what the effect of this system was as regards the revenue?—The revenue increased considerably under this system, as compared with the farming system.

4000. And do you know at all what amount per head of the population it realised?—No; I cannot say with any accuracy.

4001. Then what became of the Sudder distillery system; was that continued?—The Sudder distillery system continued exactly as it was before; but of late years, that is to say since the year 1860, there has been a great extension of the Sudder distillery system. It was found that what was called the out-still system (that system which I have been describing), led to a very great extension of drunkenness. It was the obvious interest of the excise officers, in order to show good returns, to open as many shops as they could, and the consequence was that when a few people were collected in a village, shopkeepers were persuaded to take out a license in order to supply them with liquor; and I have no doubt that in that way the habit of drinking was introduced into villages, where it did not exist before.

4002. And there was a great increase, therefore, you think, of drunkenness?—I think there was a great extension of the habit of drinking among the agricultural population.

4003. But how was that to be obviated by the extension of the Sudder distillery system?—Because, when you once introduce the Sudder distillery system it no longer becomes the interest of the abkari officer to open additional shops for the sake of showing an increased revenue. The duty is then taken, not by petty abkari officers, but by an officer of higher standing; and the duty is taken by him from the liquor as it leaves the distillery.

4004. Therefore, you think that the number of retail shops was less in the Sudder distillery districts, than in the districts under the other system?—It became less; and at the same time, by reason of getting the whole process of distillation under the surveillance of excise officers within four walls, you could levy a much higher rate of duty upon the spirit than through this indirect medium of daily licenses.

4005. What was the rate of duty taken under the Sudder distillery system?—The rate of duty upon country spirits has always been regulated by the customs duty upon imported spirits, and that is now 3 rupees a gallon.

4006. How long has that rate been imposed?—For some 20 years.

4007. Then are the two systems still in force, or is the Sudder distillery system now universal?—

Sir
C. Braden,
R.C.S.I.

9 May 1871.

Sir
C. Beadon,
K.C.S.I.
—
9 May 1871.

The Sudder distillery system is almost universal. But there are some remote places where the consumption of liquor is so small that it would be impossible to establish a Sudder distillery, for this reason: that the country liquor which is distilled by the native process is so weak that it will not bear carriage. It does not keep, and will not bear carriage for any great distance. At the same time the quantity required for these remote districts is very small, so that in some of these districts the system of out-stills still prevails; that is to say, people are allowed to put up a still and take out a license, paying a daily tax; but that was reduced within the narrowest limits, and it is the object of Government to get rid of that out-still system altogether, if possible.

4008. Can you state what has been the result of this to the revenue?—The result to the revenue has been a gradual improvement.

4009. Have you got a table there showing what has been the increase of consumption, and the increase in revenue?—No, I have no table which distinguishes between liquors and drugs; but the alkari revenue generally of Bengal has increased gradually every year.

4010. The duty remaining the same?—The duty remaining the same.

4011. Do you know whether there has been any increase of intemperance in Bengal of late years?—I think among the upper classes there has been.

4012. But amongst the mass of the people?—No, I have not observed it myself. There was certainly a complaint against the out-still system; the missionaries made it a matter of official complaint to the Government, that under the influence of that out-still system drunkenness increased; but since that out-still system was abolished, and the Sudder distillery system was introduced, I have heard no complaints.

4013. Have you heard any complaints made by the missionaries that the British administration has tended to increase the consumption of intoxicating drinks, and intemperance among the people of Bengal?—Yes, I have heard that said so.

4014. Do you think there are any grounds for those complaints?—No doubt the consumption of intoxicating liquors has increased and is increasing.

4015. But do you think that the effect of that consumption has been perceptible in the condition of the people and in their manners?—No; I think they drink more; but there is no more perceptible drunkenness that I ever observed except among a few of the higher classes.

4016. But do they not drink English intoxicating liquors?—Chiefly.

4017. Mr. Cave.] Did the consumers distil these liquors for themselves before the British rule?—No, I apprehend that there was always a particular class of people whose business it was to distil liquors. It is a matter now which is very much in the hands of one caste.

4018. And was there a duty upon it in the time of the native princes?—I am not prepared to say. I do not know.

4019. Because upon that would depend the question rather, whether the British rule had increased or diminished the incentives to intoxication, would it not?—Yes.

4020. But you do not know whether they did or did not?—I believe there was some duty, but I cannot tell you what it was.

4021. Mr. Birley.] The licensing system has rather tended to facilitate the habit of drinking, has it not?—That system of petty licensing which I described undoubtedly had a tendency to do so.

4022. And, so far, it may be said that the British rule has increased drinking or has tended in that direction?—I think in that respect it did.

4023. But the present system, you think, will not have that effect?—The principle of the present system is to extract the highest possible amount of duty from every gallon of spirits that is drunk, and that would rather check it.

4024. If there is an increase of drinking, should you attribute it rather to the more prosperous condition of the natives than to any other cause; their having more money to spend upon it?—Undoubtedly.

4025. So that in the case of the native government it was rather their poverty than their will, I suppose, that led them to drink less, in your opinion, if it were the fact that they did drink less?—Yes; but I do not know anything about the state of the consumption then.

4026. I simply wished to know whether, in your opinion, there was any reproach upon the British Government in this respect?—I should say none.

4027. Mr. R. Fowler.] When you speak of intemperance having increased among the higher classes, is that among the Mahomedans or the Hindoos?—Among the Hindoos.

4028. The Mahomedans, then, act on the principle of their own religion?—I do not think that there is so much drinking among the Mahomedans of the higher classes as there is among the Hindoos.

4029. Of course we all know that in the Koran wine is prohibited to the Mahomedans and all intoxicating drink, in fact, and you think that they generally act upon that, as I understand you?—Yes, I do not think that there is much drinking among the Mahomedans.

4030. Sir D. Wedderburn.] Do fermented liquors, such as toddy, come under the head of alkari in Bengal?—Yes; my observations in reply to the Chairman's questions were directed exclusively to spirituous liquors.

4031. Is the spirit in Bengal distilled from rice or from other substances?—From rice and sugar, and in some parts of the country from the flower of a tree called the mouwah tree.

4032. Mr. Beach.] Is there any duty on spirits consumed by the troops, or is that supplied entirely by their own commissariat?—There is no duty levied on the spirits supplied by the commissariat to the troops. If the troops go into the bazaars and buy liquor on their own account they must pay for it of course.

4033. Have they the opportunity of buying spirits at their own canteen?—Yes.

4034. Are the spirits adulterated to any extent do you think in Bengal?—No, I think not. On two or three occasions complaints were made to the Government while I was there, and twice committees of inquiry were appointed, and they examined a great deal of liquor in most of the shops in Calcutta, but the only kind of adulteration they could find was simple dilution by water.

4035. In case of anything noxious being put into the liquor, would the license be renewed to the individual?—I cannot say whether that is one of the conditions of the license, or not.

4036. At all events the attention of the Government

vernment would be directed to it if it were known?—If it had been discovered on the report of that committee, that adulteration did prevail, I have no doubt that they would have taken means to put a stop to it.

4037. *Sir W. Laisson.*] Do you happen to know of some association entitled the Madras Association?—I have heard of them.

4038. What is it; is it a philanthropic society?—I think it is a sort of philanthropic society.

4039. I think that they have lately presented a petition to Parliament; have you had your attention called to it?—I have seen mention made of it in the newspapers, that is all.

4040. I will just read you one sentence from that petition, and I will ask you if you think there is any substantial truth in it?—Before you read the extract, I would venture to say that I know nothing about Madras. If it refers to Bengal, I am prepared to answer it.

4041. *Mr. Candlish.*] The object of the Government of India will be to stimulate drinking as much as possible, I suppose?—Certainly not.

4042. Their object is revenue?—Yes.

4043. The more drink, the more revenue?—Their object is to gain the largest amount of revenue from the smallest amount of drink.

4044. The natives have nothing to say to the introduction of licenses amongst them; they have no permissive Bill there?—Any person may apply for a license, but whether he gets it or not depends upon the Government officer.

4045. Exclusively?—Yes.

4046. In high temperatures, I presume, spirits will be very much more injurious to the human system than in a temperate climate like ours?—I should think they would.

4047. Have you known evils in physical and moral results to any large extent from the use of spirits?—Not among the natives; I have known such instances among Europeans.

4048. Not amongst the higher class of natives?—Yes, among the higher class of natives, not among the lower class of natives.

4049. *Mr. Hermon.*] I understood you to say that these retailers of spirits had a license, for which some of them paid as little as a farthing a day, and some a half-penny, and that it was a matter of bargain with the excise officer?—Yes.

4050. Has the excise officer arbitrary power in granting these licenses, or is he under control, and has he to refer the matter to head quarters first?—I think under the out-still system the local excise officer had power to grant such licenses, but he was bound to send in a daily or weekly report of what licences he granted to the principal officer of the district.

4051. I understood you to say that the arrangement was a matter of bargain between the excise officer and the retailer?—Yes.

4052. *Mr. J. B. Smith.*] Do you think that the English example of drinking spirits has had any effect upon the natives?—I think it may have had an effect upon the higher class of natives.

4053. An injurious effect?—An injurious effect.

4054. Is there much intemperance among the English in India; in Calcutta, for instance?—It may seem perhaps a contradiction, but if there is any drunkenness among Europeans in India, it is among the lower class of Europeans.

0.59.

4055. The better class do not drink to excess?—No.

4056. But still you think that the English example of spirit drinking has had an injurious effect upon the natives?—I think so. I think that the higher class of natives, in following the example of English gentlemen in drinking moderately, have carried that habit too far, and taken to drinking to excess.

4057. Do the higher classes drink wine or spirits?—They began with wine, but I think in many instances they have taken to spirits now.

4058. *Sir T. Bazley.*] In cases where the natives are earning larger wages than formerly, do they save money out of that increase of wages?—Yes, I think they do.

4059. Do many of them expend any portion of that increase in better furniture or in better clothing?—Yes, they do.

4060. Then what proportion, may I ask, do you think, of the people are disposed to spend their increase of wages in intemperance?—I cannot answer that question.

4961. But you have seen a visible increase in intemperance?—Well, it is not everybody who drinks. The industrious and the economical spend their savings upon better clothes, and better furniture, and better houses; but those who are given to intemperance waste their money in drink.

4062. And they are the few who do that?—I think they are the few.

4063. *Chairman.*] Will you be good enough to explain how the next item, the fermented liquor excise, is collected?—The fermented liquors in Bengal are two. There is the tari, what is commonly called toddy, which is extracted from the palmyra tree and fermented; and the other is a kind of fermented liquor that they make from rice, which is called putchweye.

4064. *Mr. Eastwick.*] It is the fact, is it not, as we see from the native writings, that there was considerable drinking among the Mahomedans in the old day; we know very well that some of the emperors were drunkards, in fact?—So it is said.

4065. Therefore it is not a vice that has been introduced by the Europeans; it did exist before?—Certainly.

4066. It is also the fact, is it not, that drinking is part of the religion of one sect, at all events, the Tantrika sect; their ceremonies are performed with the drinking of spirits?—I do not think that they are known in the Lower Provinces, not in Bengal.

4067. Still they are a Hindoo sect?—I have heard that they are such.

4068. And also amongst the Hindoos drinking has been carried to a great extent; we know that Jeswunt Rao Holkar died of drinking cherry brandy, and that Runjeet Singh used to drink to excess?—Drinking was by no means unknown in those times.

4069. Is it not the fact that the aboriginal tribes drink to excess; for instance, the Santhals?—Yes, most of them.

4070. Is there any check upon their drinking; do we impose a license in the districts?—Wherever we can.

4071. But I suppose that there is an immense quantity of liquor manufactured among them that we do not touch at all?—Very little in the shape of spirits; the Santhals chiefly drink this fermented putchweye.

B B

4072. *Chairman.*]

Sir
C. Beadon,
K.C.S.I.

9 May 1871.

Sir
C. Beadon,
K.C.S.I.
9 May 1871.

4072. *Chairman.*] What arrangements are made for collecting revenue from these two fermented drinks of which you have spoken?—It is done simply by licenses for the sale of them.

4073. Are any licenses issued?—In some districts.

4074. How is the revenue obtained on the license; by what process?—It is an annual license.

4075. But how is the amount of revenue fixed on the license in this case?—By competition.

4076. By competition for a district, or for a single shop?—For a single shop, with a certain territorial monopoly attached to it.

4077. Is it only the one shop, or is the person at liberty to set up as many shops as he pleases within his district?—He must take out a license for each shop.

4078. Is that a fixed rate of duty?—No, it depends upon circumstances.

4079. How is it assessed?—By competition.

4080. On what principle is the competition established; is the district first marked out, and are the competitors at liberty to establish any shop they please within the area, or on what principle is the competition carried on?—There is a certain limited area, say, one village: there is very seldom more than one shop in a village; and any person who wishes to set up a shop for the sale of tari, or putchwey, applies for a license. Then a notice is stuck up in the village, and on a day appointed this little monopoly, as you may term it, is put up for sale.

4081. But supposing there is a shop already established in that village?—Then the collector will not receive an application; or if an application is made the person who already holds the license opposes it. If it is thought that the village is big enough to hold two shops the excise officer will allow two to be established, and let them compete with one another.

4082. In the case of a single shop, where a man has once obtained a license by competition, what is done in regard to the continuance of that license?—He has it for a year, and at the beginning of the next year it is put up again for sale.

4083. Then in towns, what is done where there is a considerable population; is the town divided into separate districts?—No, I think not.

4084. How is the issue of licenses regulated in the towns?—I believe in the same way. If a person applies for a license, it is to put up a shop in a certain locality, and that right is put up to auction.

4085. If the collector thinks it desirable?—Yes, if he thinks it wanted.

4086. Does he take any means to find whether it is desirable?—Yes.

4087. Does he make a report of the result of that inquiry?—Yes, to the principal excise officer of the district, and he exercises his discretion.

4088. Can you state what is the amount paid for these licenses by competition; do they vary very much?—They vary a good deal.

4089. Can you give us an idea of the maximum and minimum?—No, I cannot with accuracy.

4090. Do you know how much revenue is derived from this source?—The whole revenue derived from tari in 1868–69, was 537,000 rupees, and from putchwey, 128,000 rupees.

4091. I suppose whether it was the one or the other depending upon the natural produce of the district?—Yes, and the taste of the inhabitants.

4092. Is any land revenue taken for the trees, or is this excise the measure of the profit of the trees?—If land revenue is taken for the trees it is taken by the zemindar, the Government knows nothing about it.

4093. Is there another item?—The next item is the bhang or ganjah.

4094. On what principle is that collected?—Ganjah, which I believe is known by the botanical name of *Canabis Indica*, by accident more than anything else, happens to be grown only in two districts of Bengal. The cultivation in those two districts is under the general supervision of an excise officer who compels the cultivators to collect the hemp plant after it is out and to store it in certain places under excise surveillance.

4095. And how is the duty levied then?—Then no one is allowed to purchase this ganjah, except licensed wholesale dealers. These licensed wholesale dealers apply to the collector for passes, for the quantity of a ganjah that they wish to take out for sale, and for those licenses they pay so much a seer (which is 2 lbs.) for the ganjah. They then go to these warehouses where the ganjah is stored and receive as much as is covered by their pass; that pass enables them to take the ganjah to wherever they please in any part of the country, and there they sell it to retail vendors who take out a license from the local collector for the sale of the ganjah, and the preparations that are made from it.

4096. Then there is a duty collected, both from the license to take the ganjah to manufacture, and from the license to retail the liquors?—Yes; but the principal duty is taken through the wholesale vendor.

4097. And is anybody entitled to take out a license to retail the liquor; or is there any restriction upon that?—Just in the same way as ordinary liquor licenses are taken out.

4098. Have you got the amount of revenue collected from this branch?—Yes; there are two sources. There is first the ganjah itself; the duty upon the ganjah in 1868–69 was 968,000 rupees; and the license duty for the retail sale of it was only 11,000 rupees.

4099. Has it been an increasing revenue?—Yes.

4100. Has the amount of the duty remained stationary, or has it been raised?—It has been raised. It used to be 2 rupees a seer, and I think it is now 3 rupees a seer; that is, it was 2 s. a pound, and it is 3 s. a pound.

4101. That, with what you have already mentioned, constitutes the whole abkari of Bengal?—Yes.

4102. Do you expect that this abkari revenue, as a whole, will steadily increase with the improvement in the population?—I should think so; it has done so hitherto steadily.

4103. Can you give us the amount that it was some years ago?—This is a table which gives the gross amount of abkari revenue in Bengal from 1852 up to 1868–69. In 1852 it was 282,000 £; 10 years afterwards, in 1862–63, it was 567,000 £; and last year, 1868–69, it was 710,000 £.

4104. Can you give the rates of duty at those different periods?—No, I cannot.

4105. That

4105. That is due partly to increase of rates and partly to increase of consumption of the commodities?—Yes.

4106. Sir *D. Wedderburn*.] I suppose, in the case of these drugs, you would consider that revenue was the first consideration; it would not be any drawback if the consumption were diminished, so long as the revenue was at a good figure?—Certainly the increase of revenue is the great object.

4107. It would be, in itself, rather desirable to check the consumption by increasing the duties, if you can do so without seriously injuring the revenue?—I think that is the case with regard to ganjah. I think it is a very noxious drug.

4108. What are the exact effects of it?—It produces a violent intoxication. It is that drug under the influence of which the Malays are supposed to be when they run-a-muck.

4109. Sir *W. Lawson*.] What is arrack?—Arrack is the country spirit, the spirit which is distilled by the country process. It is called arrack in Madras; in Bengal it is called doosta. The process is nothing in the world but a great earthen jar with a tube, which falls into a cooling vessel.

4110. What is it made of chiefly?—Sugar and rice.

4111. And there is alcohol in it?—Weak alcohol.

4112. Arrack is consumed entirely by the lower classes?—Yes.

4113. With regard to the granting of the licenses, is there any inquiry made into the character of the individuals who are to get the license to retail?—Yes; the magistrate makes inquiry; no collector's license is valid until the magistrate has made inquiry through the police.

4114. He inquires into the character of the man?—Into the respectability of the man.

4115. Does he, as he is supposed to do here, inquire into the suitability of the premises; is that part of his duty?—No, I do not know that the question ever arises; it is generally nothing but an open hut.

4116. Has the licensing authority power, or is the license authority desired to inquire at all into the wants of the people, or is he bound to grant the license totally irrespective of whether the people wish for it or not; does that consideration come into his duty?—No, I should think not.

4117. And I think you said that no licenses are granted for more than a year?—Yes.

4118. Mr. *McClure*.] Is the sale of the different descriptions of liquor combined in one establishment?—Sometimes it is; but a man has to take out a separate license for the sale of each.

4119. Mr. *Candlish*.] I think I understood you to say that the wholesale dealer in ganjah pays on quantity?—Yes.

4120. The retailer not on quantity, but a specific sum for a license to sell?—Yes.

4121. The duty paid by the wholesale dealer is large in proportion to the actual and ultimate cost to the consumer?—Yes.

4122. What proportion does the duty bear to the consumer's price?—I cannot tell you what the consumer pays.

4123. Speaking of value generally in any sense you please, what proportion of the price generally is duty, and what is intrinsic?—The duty paid by the wholesale dealer is nearly 10 times what he pays the ryot for the plant.

0.59.

4124. Then there will be in that case an enormous temptation to smuggling?—Yes, there is.

4125. And an enormous amount of smuggling in proportion to the temptation?—No; because it is not an article that is easily concealed; it is not an easy article to smuggle; it is not like opium.

4126. Do you think that there is not much smuggled?—Not much.

4127. Mr. *B. Denison*.] Did I rightly understand you to say that the shops for the retailing of spirits were accurately defined by the local district authorities; was not the question asked you, whether the surveyor of license was at liberty to open shops at his own pleasure, or whether the wishes of the people were considered in the matter?—I do not think that the excise officer consults the wishes of the people much. I think he grants a license to any respectable person applying for it, providing he can give security.

4128. We are speaking now of native spirits?—Yes.

4129. Is it not the practice to put the license up to auction, giving, at the same time that the auction is held, a specified list in detail of the places in which it is open to him to have shops?—Yes, I believe it is; he gets a monopoly within certain specified limits.

4130. But is the license holder, or the contractor, as we had better call him, at liberty to multiply the number of shops for sale without the leave of the authorities?—Certainly not. In Bengal he is obliged to take out a separate license for each shop.

4131. Have you had reason to find fault with the extension of these spirit shops along the great roads of the country as promoting crime?—No; I never heard of any such fault being found with them.

4132. You have not had applications made to you from the magistrates, or from police officers, to decrease the number of spirit shops along the main roads of the country?—I do not recollect anything of the kind with reference to the main roads particularly, but magistrates have complained that the shops have been unduly multiplied for revenue purposes. But now magistrates have it in their power to veto the establishment of a shop.

4133. As distinct from the collector and the revenue officer?—Yes.

4134. Then what would be the process under the new system previous to the annual sale; would the magistrate supply a list of places at which it was desirable to have shops?—I think the license would be granted subject to the approval of the magistrate in the police department.

4135. It is fair and correct to assume, is it not, from long observation, that in years in which the abkari revenue is on the increase, the condition of the people is generally easy?—Yes, I think so.

4136. That is the observation of long experience?—Yes.

4137. You do not think that under the present system there is any moral evil connected with the system for which the Government are fairly responsible?—No, not under the present system. I think so far as the Government interference goes, it must tend to check drunkenness rather than to increase it.

4138. In fact, all the regulations of the Government are devised with a view to make the sale of spirits as difficult as possible, and to get as high a price as possible for revenue purposes?—I think so.

B B 2

Sir
C. Beadon,
K.C.S.I.

9 May 1871.

Mr. WILLIAM GEORGE PEDDER, called in; and Examined.

Mr W. G. 4139. *Chairman.*] WHAT appointment do you
Pedder. hold in India, or have you held there?—I have
— been an Assistant Magistrate and Collector for
9 May 1871. some years; afterwards, I was about 10 years in
the Settlement Department of the Revenue
Survey, and employed on various kinds of special
duties, and I have lately been employed to con-
duct an inquiry into the Salt Department in
Bombay.

4140. Will you be good enough to state what
has been the system of collecting the salt revenue
in Bombay?—The system is that of an excise.
A portion of the revenue is levied by means of
an import duty.

4141. When was the excise system introduced
into Bombay?—The excise system was intro-
duced into Bombay first in the year 1837.
Before that time there was a sort of rough system,
but the regular excise was introduced in 1837.

4142. Was the duty previous to 1837 imposed
in the form of a transit duty from the districts
where the salt works were?—Partly so; partly
excise, partly monopoly price at the various salt
works which were the property of the Govern-
ment.

4143. In that year one uniform plan was estab-
lished, as I understand?—Yes.

4144. What was the rate of duty?—Eight
annas per Indian maund of 82 pounds.

4145. Was that afterwards increased?—That
eight annas was imposed in 1837, in substitution
of transit duties then abolished, and in 1844, I
think, town duties and taxes on professions were
abolished, and the salt duty was raised to 12
annas.

4146. And what changes have been made in
the duty since that time?—In 1859, I think, the
duty was raised to one rupee, in 1861 to one
rupee and a quarter, and in 1865 to one rupee
and a half; and in 1869 to one rupee and
13 annas.

4147. Will you be good enough to state the
exact system on which you levy the excise duty
on the manufacture?—In the greater part of the
Presidency the system is that of a free excise. In
the northern part of the Presidency the works
are all actually the property of the Government,
and the Government pays a fixed price for the
salt to the makers. In the rest of the Presidency
the system is that of a free excise upon manu-
facture, the manufacturers being required to take
out licenses to open works, and certain precau-
tions being taken to prevent smuggling.

4148. And may any one that possesses land
suitable for the evaporation of salt take out a
license?—He may apply for it.

4149. Does he get a license as a matter of
course?—No, certainly not. He must show that
there is likely to be a considerable demand for
his salt.

4150. Is that a view merely for the correct
collection of the revenue, so as not to allow small
works to be established?—With a view to the
protection of the revenue.

4151. Subject to that condition, that it is to
be on a sufficient scale, he is at liberty to take
out a license?—According to the present law,
the Commissioner of Customs has the right of
suppressing any work at once that does not pro-

duce 5,000 maunds per annum, and that is the
limit that is aimed at.

4152. If he can show that he can produce as
much as that the license is given to him?—As
a rule.

4153. What is the rule in the north?—In the
north the whole of the works are the property of
Government, and have been from time imme-
morial, and the manufacturers manufacture the
salt at a fixed price of one anna and a quarter per
maund.

4154. By contract with the Government?—
By contract with the Government. They ask
permission to manufacture, and for what they sell
they receive one anna and a quarter per maund.

4155. They are tenants under the Govern-
ment?—Yes.

4156. Are the tenants permanent, or is there
any system of competition?—No, there is no
system of competition at all; they are mostly
cultivators as well as salt makers, as a rule.

4157. Can you state what has been the growth
of the revenue under the system, or rather of the
production of salt?—Besides the deliveries for
the interior consumption, for the consumption of
the Bombay territory itself, a very large quan-
tity of salt is exported by sea either to the Madras
coast or to Calcutta; deducting that, the increase
has been very small. In the first five years, for
which we have accurate accounts, beginning with
1843–44, the average sales were Indian maunds
30 lacs, 39,000; and in the last five years
ending with 1868–69, they were Indian maunds
30 lacs and 44,000, that is to say, taking similar
areas. I have omitted in that the district of
North Canara, which was transferred in the
interval from the Madras Presidency to the
Bombay.

4158. Does that include all the salt that was
sent into the interior after paying duty?—All the
salt that was sent into the interior, after paying
duty, but not the salt that was exported by
sea.

4159. But is the salt so sent into the interior
consumed both within and beyond the Bombay
Presidency by native states?—Yes; it is con-
sumed both by the possessions of the British
Government within the Bombay Presidency, by
the native states included within the Bombay
Presidency, and also to a considerable extent by
the Central Provinces and Central India, gene-
rally.

4160. You are not perhaps able to give any
very definite area for the consumption of the
Bombay salt, or have any means been taken to
ascertain that?—Yes, I think I can; the quan-
tities of salt I estimate to be as follows; that the
average amount consumed within the Bombay
Presidency is about 21 lacs and 86,000 maunds;
that exported to Berar and the Central Provinces
about four lacs and three-quarters; that to
Malwa, and other foreign states, about a lac and
three-quarters; and to the Nizam's dominions
and Mysore, about four lacs.

4161. With these corrections that you have
just stated, are you able to state what has been
the consumption per head or otherwise of salt in
the Bombay Presidency?—It is difficult to say
within a certain margin, because our census is
very imperfectly framed; but I estimate that the
annual

annual consumption in the Bombay Presidency itself is just under 11 pounds.

4162. Having regard to the increase of population during the period that you have mentioned, and the facilities that have been given for carrying salt into the interior, do you suppose that the consumption per head of salt has rather diminished than increased in the Bombay Presidency?—I think the real consumption has increased considerably, but I think that the licit consumption has diminished. I mean that smuggling has increased largely.

4163. Is it your opinion that the actual consumption of the people in the Bombay Presidency is increasing, though the consumption of that which pays duty has diminished?—Yes.

4164. Have you any idea of the extent of the salt that is illicitly sold?—The best estimate that I have been able to make is that the actual consumption is about 14 lbs., the licit consumption now being a little under 11 lbs., taking the Presidency as a whole.

4165. Are there any other sources for the introduction of salt into the Bombay Presidency than the salt pans along the sea coast?—A large quantity of the best salt is made by solar evaporation from the saline deposit on the Runn of Catch.

4166. Is much of that salt produced without any labour naturally?—There is a quantity of salt naturally produced upon the Runn; but the whole of the salt that is used except by the people immediately in the vicinity is manufactured salt, manufactured by solar evaporation.

4167. Is there any other source?—A quantity of free manufactured salt is imported from Cambay and the Portuguese dominions of Goa and Damaun.

4168. Is there a strict frontier cordon to levy the duty on that salt?—Yes; a good deal is supposed to pass without paying duty, the country being wild.

4169. The customs duty is the same as the excise?—Yes.

4170. By what other means do you suppose there is such a large quantity of salt produced for consumption illicitly?—The works being very much scattered on the sea coast and all the tracts very difficult to guard, and there being a strong temptation to smuggle, it is very difficult to guard against it, and, I think, hitherto, the people employed to guard have been underpaid and not sufficiently numerous.

4171. Is it to that that you ascribe the growing system of evasion of the duty?—I think so. I think that a system of free excise permits smuggling more than the system of monopoly in Madras.

4172. Have you studied that Madras system?—As much as I have been able to do by correspondence with other officers; I have not seen it.

4173. Do you think that a monopoly system affords greater facilities for the collection of the duty?—I think so.

4174. But do you think that, relatively, there is less smuggling in the northern half of the Presidency than in the southern?—No; because, though the salt pans belong to Government, we have not taken the same precautions that they have in Madras.

4175. In Bombay does the Government take its salt into its own store, or does it allow the person who manufactures it to sell it direct to the merchants?—He sells it direct to the mer-

chants; he is supposed to store it, but within certain limits.

4176. The salt does not come into the possession of the Government?—No.

4177. Who pays the duty; the man who manufactures it, or the merchant who purchases it from the maker?—The merchant when he takes it.

4178. Does he take a permit to remove a certain quantity of salt?—Yes, to remove a certain quantity to a certain district, and having paid a certain price; and upon that quantity of salt he pays the duty; and it is then delivered to him under the inspection of a Government officer by weight.

4179. Is the process very much the same as is adopted on the southern side, where there is no Government manufacture?—The same process is adopted in both divisions; only in one case the salt belongs to Government, and in the other case to private persons. In the southern division the price is fixed by bargain between sellers and buyers, and in the other case the Government fixes a permanent price.

4180. Is there any difference between the two prices?—The average price is almost exactly the same; but whereas the price in the northern division, which the Government fix, is always 2 annas a maund; in the southern it varies from an anna and a quarter up to 3 annas.

4181. Depending upon what circumstances?—A great deal upon the demand, and also a great deal upon the different qualities of salt; there are two or three qualities of salt that are specially liked.

4182. Is there any difference in the cost of collection in the northern and southern divisions?—No, I do not think there is.

4183. Practically, then, the only difference is, that in the one case there is a fixed price, and in the other case the manufacturer and the merchant settle the price between them?—That is practically the only difference.

4184. Is it your opinion that it would be desirable to adhere to these systems, or one of them, or to make any change?—I think originally it would have been better to have introduced the Madras monopoly system, but I do not think that it would be practicable to do so now, because it would interfere with vested interests.

4185. Which of these two systems would you retain?—Where the works are now the property of the Government, I would still retain them as the property of the Government, because when they are the property of the Government they are much more easily supervised.

4186. On what principle do you think it desirable that the Government should be the proprietor of salt works?—I think that where you have a very heavy excise duty, with very large temptations to smuggling, the supervision must necessarily be exceedingly close.

4187. But, as far as I can understand from you, the supervision is just the same in either case?—Not exactly so; the system of supervision is the same, but in the one case, where the salt is actually the property of Government, it can be stored much more effectually, and be much better watched, than it can where it belongs to a number of persons, each of whom can store it over a very large area.

4188. Do you think it desirable that the two systems should still continue in force in Bombay?—I think so, with modifications.

Mr. W. G. Pedder.

9 May 1871.

- Mr. W. G. 4189. What modifications would you make to
Piddar. put an end to the large extent of illicit consumption
 9 May 1871. which you suppose exists?—I think that the smaller works ought to be suppressed, and the larger works increased so as to concentrate the manufacture as much as possible; that the system of storing should be as much as possible modified, so that Government should know what amount of salt is produced and sold, and what amount of duty is paid; and that the number of the native officials ought to be increased.
4190. It would seem from the figures you have given, that the illicit consumption has been gradually increasing as the rate of taxation has been increasing?—I think so; there has been a greater temptation to smuggling.
4191. Have you got a statement showing the growth of the revenue during the periods that you have mentioned?—Yes.
4192. Will you kindly give the average of the first five years and the last five years?—The average of the first five years at a duty of 12 annas a maund was 23 lacs and 90,000 rupees; and the last three years, that is to say, at the duty of 1 rupee 8 annas per maund; it was 45 lacs and 55,000 rupees, or 45½ lacs.
4193. Have you heard any complaints from the inhabitants of the Presidency as to the increase of the duty?—No, I do not think so. On each occasion when the duty has been raised, there has been a certain amount of complaint, but not from the people themselves. I think the people feel it very little.
4194. Is salt used in the Bombay Presidency for any other purpose than for domestic consumption?—A good deal is given to cattle, and a good deal is used for curing fish.
4195. Have those who used it for the commercial purpose of curing fish raised any complaint about the increase of duty?—No, I have not heard any; but I think they smuggle a great deal of their salt; they have facilities for smuggling from foreign territories.
4196. But there is no exemption allowed them?—No.
4197. Do you think that this duty prevents the use of salt for agricultural purposes?—It is very difficult to say. I do not think it would be used under any circumstances, except to give to cattle; but it is supposed that the cattle get a little less than they otherwise would.
4198. Do you think that it keeps down the industry of curing fish?—I think not, as a fact. If the duty was really paid, I think it would put our fishermen at considerable disadvantage compared with the fishermen of a foreign territory, Kattywar, for example; but as a fact, I believe nearly all the salt used on the coast is smuggled; partly that it is removed illicitly from our own salt pans, and partly that it is brought in the fishing boats themselves from the native territories.
4199. You think that that fact modifies the inconvenience that would otherwise result from increased duty?—Yes. I should explain that the inconvenience to the fishermen is this, that their fish which is cured with salt, supposed to pay the tax, is brought into competition with foreign fish brought to Bombay, salted with foreign salt.
4200. Is there much disposition to carry salt fish into the interior, as an article of food?—It is carried very largely into the interior.
4201. Do you think that the revenue from

salt in Bombay is capable of improvement?—I think that a stricter system would certainly increase the revenue.

4202. By putting down illicit consumption, you mean?—Yes.

4203. But do you think that the revenue could be raised still further?—I should be sorry to see it raised much further. It might go up to two rupees; above that I think it would check consumption.

4204. Can you explain why the people of Bombay should be less able to pay the rate of duty of three rupees than the people of Bengal?—I should very much doubt whether they are less able to do so.

4205. We have been told that the people of Bengal do not feel the present rate of duty; how is it that the people of Bombay would feel it?—The danger I think of raising the duty considerably in Bombay would be, that there are so many facilities for manufacturing salt or bringing it across the frontier if you raise the duty.

4206. Mr. B. Denison.] What frontier do you refer to?—The frontier between Rajpootana and Bombay, around the Portuguese dominions and that which divides Bombay from Kattywar.

4207. Chairman.] Is that Rajpootana salt a sea salt, or how is it obtained?—It is manufactured almost in the same way as the salt of the Runn is manufactured. I do not consider that the tax presses at all heavily upon the people at present. The incidence of the tax is about 3 annas 8 pies per head per annum; that is exactly 5 d.

4208. What do you consider to be the earnings now of a labourer in the rural districts of the Bombay Presidency?—Agricultural labourers are almost entirely paid in grain, but upon the railroads, and on the public works, and buildings in towns, unskilled labour is paid from four to six, and even up to eight annas a day; I think that six annas a day you might put down as a fair average for a man.

4209. Then, in your opinion, there is no ground for complaining of the oppressive character of the present amount of the tax as regards the consumption of the people?—No, I think not.

4210. Mr. Cave.] Yet you say, that unless there were smuggling, the tax would be oppressive?—In the especial case of the fishermen, and I have given the reason, namely, that the fishermen are exposed to unfair competition.

4211. The fishermen are part of the population, and the salt tax interferes seriously with their industry, does it not?—It ought to interfere with it, but it does not. I think the reason is, that when the Customs Act was passed, a mistake was made in exempting foreign fish from taxation.

4212. You think that if a customs duty was imposed upon foreign fish, then the smuggling would cease among those who cure fish in the Bombay territory?—They would not have the same cause for smuggling.

4213. Then with regard to the rest of the population you do not think that the tax does press at all heavily upon them?—No.

4214. And do you think that they do not use smuggled salt?—In many places there is a sort of trade in smuggling; many of the people who live along the sea coast, fishermen or others, smuggle either across the frontiers, or from our own pans. That however does not affect the cost to

to the people the least in the world; the consumers pay as much for smuggled salt as for salt that has paid the duty.

4215. But the revenue loses?—Yes.

4216. Would it not be better to have a lower duty, which would discourage the smuggling trade; would not that be more profitable to the revenue?—I think that unless you put it down to 8 annas or 12 annas a maund, it would not make much difference.

4217. You stated that you thought the best plan would be for the sake of the revenue to increase the stringency of the customs?—Yes.

4218. And it is a question between that, and lowering the duty sufficiently to make smuggling unprofitable; which would, in your opinion, be the best for the revenue?—I think there can be no doubt that we should lose revenue by lowering the duty now. Every time we have raised the tax we have raised the revenue, therefore, by lowering the tax we should lower the revenue.

4219. We were told that in Bengal the salt tax was a sort of poll tax, and that whatever the price was the people consumed pretty much the same amount in the course of the year; would you say the same as to the people of Bombay?—I should say very nearly so. I think that a heavy tax would to a certain extent check the consumption, and make the people more careful in the use of the salt.

4220. Would there be any difficulty in imposing a customs' duty upon foreign fish?—I think there would, there are so many small creeks and ports into which ships can run.

4221. You think that the expense of maintaining it would be greater than the profits derived from it?—I should be inclined to think so.

4222. Mr. Fivcett.] According to your statement, there has been an increase in the salt duty since 1840 of 250 per cent., has there not?—Nearly 250 per cent.; it is from 8 annas a maund to 1 rupee 13 annas.

4223. That is more than 250 per cent.?—I think it is rather more. One rupee 12 annas would be 250 per cent.

4224. Why has that been the case; is it owing to the exigencies of the Government?—I suppose so; also because it has been strongly urged upon the Bombay Government by the Government of India and by the Government of Bengal, that it was unjust that the people of Bombay should be taxed so much lighter for salt than the people on the other side of India.

4225. Still the last increase of duty was distinctly, was it not, in consequence of a heavy financial deficit?—Yes.

4226. So that, speaking generally, this tax has been steadily increasing since our rule began in India?—From the time it was first imposed it has been raised at intervals.

4227. So that we may look forward, I suppose, to this, that if the state of Indian finance continues with a steadily increasing expenditure, the demand to raise the salt duty in Bombay will be continued?—I can hardly tell you that; I suppose, as long as the duty on the other side of India is $3\frac{1}{2}$ rupees a maund, there will always be a tendency to increase the Madras and Bombay rate to the same level.

4228. Still I understand that the prompting cause which led to the last increase of duty was not so much equalisation as the financial exigencies of the Government?—That was the cause generally assigned, I believe.

0.59.

4229. Can you give me any idea what would be the cost of salt in many parts of Bombay where it is produced, for instance, in Cutch, if it were not for the duty, and supposing the trade were perfectly open?—I should think it would be exactly what the cost is now without the duty, that is to say, from $1\frac{1}{2}$ to about 3 annas a maund.

4230. You may say, on an average, about 2 annas?—Yes.

4231. And now the cost is 1 rupee 13 annas?—You may say that the cost is 1 rupee 15 annas, taking the average price of salt.

4232. So that in this case we have an article of general use, taxed at the rate of 1,600 per cent.?—If you look upon it as excise, of course it is so.

4233. In whatever way the duty is levied, that does not make any difference; the people have to pay 1,600 per cent. more for the article because the Government has to levy a revenue from it?—I should say that the people have to pay a sum of about $3\frac{1}{2}$ annas per annum per head.

4234. That is what they have to pay in the year, but that is not the point; I want to bring out clearly what the amount of the duty is, and to show that price of an article of general necessity is increased by 1,600 per cent. in consequence of the revenue that the Government levies from it?—Yes, that is to say, that the excise bears that proportion to the original cost of salt.

4235. I understood you, I think, that the average consumption in Bombay on duty paying salt was 14 lbs., and that, besides, that there was an average consumption to each person of 11 lbs. of illicit salt?—No; I say that the consumption of licit salt is about 11 lbs., and I estimate the total consumption, including smuggled salt, to be about 14 lbs.

4236. Then, according to that statement, the consumption of illicit salt exceeds by 400 per cent. the consumption of duty-paying salt?—No; out of the total amount of 14 lbs. which I estimate to be the amount consumed by each one of the population, 11 lbs. pays duty and 3 lbs. does not pay duty.

4237. Then about one-third of the salt consumed, according to your figures, is illicit salt?—Not one-third, I think rather less than one-fourth, is it not?

4238. In what way is smuggling salt punished in Bombay?—It is chiefly punished by the confiscation of the salt, and any ship or vessel that contains smuggled salt.

4239. Is it treated ever with a pecuniary fine or imprisonment?—In bad cases a fine is levied in addition to the value of the salt.

4240. I understand you to say that the salt duty now is so heavy that it is impossible for anyone in Bombay successfully to compete with others in an important branch of industry unless prepared to smuggle salt?—I think it is not fair to expect our fishermen within the limits of the territories of the British Government to salt fish with salt that pays a heavy tax, in competition with the inhabitants of Kattywar, who pay a comparatively light tax.

4241. You look upon smuggling as a moral offence, do not you, as dishonesty?—Yes, certainly.

4242. Then what your statements lead to is this, that with regard to those people who are moral and honest, and are not prepared to rob the Government, it is impossible for them to suc-

ceed

Mr. W. G.
Pedder.

9 May 1871.

Mr. W. G. Pedder. proceed in their industry?—I do not think that the moral question arises in the minds of the fishermen.

9 May 1871. 4243. But supposing that some fisherman should be moral, and should say, "I cannot consent to rob the Government," it is impossible for that man to obtain a living from honest industry?—He would not be able to obtain it by salting fish.

4234. So that the effect on the revenue would be that you have a duty so high that you tell all the people that none but the dishonest can engage in it, and it is no use for the honest to compete in it?—I think we made a mistake in not putting a corresponding duty on the import of foreign fish. This duty was originally imposed on foreign fish, especially for the purpose of enabling fish

manufactured with taxed salt to compete with it, and it was taken off, I think, by a mistake, not many years ago, without due reflection.

4245. I understood you just now, in answer to a question put to you by the Right Honourable Member for Shoreham, that there were peculiar and special difficulties in placing an import duty upon foreign fish; that if you attempted to do so the facilities for smuggling would be so great there, that instead of lessening smuggling you would extend the area of it?—A considerable number of years ago we took off almost all inter-portal duties for that reason; then the duty upon fish was still kept up; after a time those duties were still further lowered, and the duty was taken off the foreign fish.

Mr. M'Clure.
Mr. J. B. Smith.
Sir David Wedderburn.
Sir Charles Wingfield.

THE RIGHT HON. ACTON SMEE AYRTON, IN THE CHAIR.

Mr. WILLIAM GEORGE PEDDER, again called in; and further Examined.

4246. Mr. Fawcett.] WAS I not correct in assuming that you stated, in reply to the Right Honourable Member for Shorcham, that it is almost impracticable, in consequence of the facilities of smuggling, to levy the import duties upon salt fish?—I do not think I said that it was impracticable, but I said that it was rather difficult.

4247. And you stated that the reason of the difficulty was, that there were almost innumerable small creeks and harbours which it would be almost impossible to watch?—It would require a larger establishment to watch them, probably.

4248. But was not the tenor of your previous evidence directly opposed to the imposition of an import duty on fish?—Yes, I think so. My own view is, that it would be better to allow each fishing-boat a certain quantity of untaxed salt, free salt.

4249. But you think the present system, in which you say, virtually, that no man can engage in this trade unless he is prepared to rob the Government, is a state of things which it is very undesirable to continue?—I think I ought, perhaps, to explain that, even supposing the duty was considerably lowered upon salt, I do not think, unless it was lowered to almost nothing, that fishermen would use taxed salt; for this reason: the way in which the fish is prepared is this; the fish are split, soaked in strong brine, and then dried in the sun. Now, it is almost as easy for the fishermen to make the brine by partially evaporating sea water as it is for them to obtain the salt which is procured from totally evaporated sea water, and make it into brine, and that would be very difficult to check. Therefore I think, myself, the question of salt fish, though it looks in theory an injustice to our fishermen, does not practically affect them much.

4250. But still is not that contradictory to your former evidence, in which you said that necessarily they must smuggle salt?—I say that whatever salt they do take in the state of salt, they most probably smuggle or obtain in some illicit manner.

4251. Now, leaving the fishermen, I believe you stated that out of the average consumption of salt for each inhabitant of the country to you have referred, 11 lbs. is duty-paying

salt, and 3 lbs. smuggled salt?—That is the estimate that I have formed.

4252. Then a considerable number of people are even engaged in selling smuggled salt and buying it?—Yes; there are certain classes who smuggle salt across the frontiers; and the manufacturers of salt, if not very closely watched, are very apt to dispose of salt not duty-paid, or more commonly to give a larger weight.

4253. You impose a penalty upon the people if you can detect them who engage in this trade, I suppose?—Yes, the penalty is the confiscation of the smuggled salt and of any vessels, or animals, or carts that carry it.

4254. In any case where the offence is repeated, is smuggling punished by imprisonment?—I am not quite certain, but I think it is never punished by imprisonment except as a means of levying the extra duty which is not paid.

4255. If a man cannot pay the fine he is put in prison?—If a man cannot pay the fine he is imprisoned.

4256. Do you punish not only persons who sell, but also those who buy this salt?—No, I never heard of its being done. To speak more accurately, the persons punished are those in whose possession smuggled salt is found. They probably have bought it before; they are probably intermediate persons, persons who have bought it for the purpose of selling.

4257. So that one effect of this salt duty is that you offer very great temptations to a very considerable number of the people to engage in a dishonest and illicit traffic?—The temptation is certainly great, because the duty is large in proportion to the original cost of the salt.

4258. And that temptation with its demoralising influence will rapidly increase; in fact, increases in proportion as the salt duties are increased?—The higher the salt duty the greater is the temptation, doubtless.

4259. I believe you stated that the last rise in salt was prompted in consequence of the financial exigencies of the Supreme Government at Calcutta?—It was so stated.

4260. Therefore if this system continues of expending each year an amount exceeding the revenue, probably another demand will be made

Mr. W. G.
Pedder.
12 May
1871.

Mr. W. G.
Pedder.
—
18 May
1871.

for an increase of the salt duties, to bring them up to the Bengal limit?—That is a matter of opinion. My own opinion is that it would be better to increase the salt duties in Bombay and Madras to something more like the level of the present duty in Bengal, than to impose new taxes.

4261. But you say that, although having clearly recognised the fact, that each increase of the salt duty increases smuggling, and tends much to demoralise the people?—I think all imposition of taxation tends to demoralise the people in that sense; they always endeavour to evade it, I mean, if possible.

4262. But am I to understand you, that with regard to all taxes that are imposed in India, there is the same proportionate amount of smuggling and evasion that there is with regard to the salt duty?—The salt tax may be said to be the only real tax upon necessities.

4263. Then when you say that the objection that you have attributed to the salt duty applies to other taxes; what do you mean by that?—I mean to say that in the case of an income tax, for instance, the people cannot be expected to give true returns of their incomes; it demoralises them in that way.

4264. Then what your evidence would come to would be this: that there is no new tax which you could suggest which would be less objectionable than the salt duty; probably it would be more objectionable, and at the same time you recognise this fact, that if the salt duty were to increase, it would very much tend to increase smuggling?—Yes; I think that if the salt duty is increased we shall require a more careful administration of the Salt Department, and more strict preventive measures.

4265. That is the general description in your mind of the present financial position of India?—Yes.

4266. Then this lesson is brought home to those who have the administration of the finances of India, that the position of the revenue and expenditure is such, that if they allow the expenditure to go on increasing as it has increased beyond the revenue, they will either have to increase the salt duty or impose some new tax, which is still more objectionable?—I think that the question is between the extent to which we shall improve administration in India, and the extent to which it is necessary to increase taxation. If we reduce taxation we must go back to the old system of doing nothing for the improvement of India. If on the other hand we make improvements in the administration and in the public works of India, we must raise a proportionately larger revenue.

4267. But without now entering into the point as to the advantages which the people of India may get from increased expenditure, we must put this as a fact, that increased taxation means, according to your opinion, the increase of the salt duty, or the imposition of a tax still more objectionable?—I think so; I think that no tax suggests itself to me that is less objectionable than the salt duty.

4268. Sir D. Wedderburn.] I gather from your evidence, that in spite of salt being such a bulky commodity and small in value, there is a great deal of smuggling and illicit traffic in salt in the Bombay Presidency?—It is almost entirely a matter of opinion. The best estimate that I have been able to form is, that about three pounds out of 14 pounds are smuggled.

4269. Is it not the case, that in the Bombay Presidency, particularly in the northern part of the Bombay Presidency, you have greater difficulties to contend with in the way of the frontier than they have in any other part of India; and you are more mixed up with native states, besides having the Portuguese dominions adjoining you?—Yes, I certainly think so.

4270. Would it not be possible, by a convention with the native states analogous in some degree to the Zollverein, to diminish very greatly the smuggling?—Yes, I think it might be possible. But the smuggling to which we are most exposed is from Rajpootana, and I think that Rajpootana is probably the part of India with which we should effect a treaty of that kind, with the greatest difficulty. I think, with regard to the Portuguese dominions, and also to other foreign states more within our own territory, that some sort of convention might be comparatively easily arrived at; but with Rajpootana there would be a difficulty.

4271. Is salt smuggled in any large quantities from the north, from the Punjab, or from Cutch?—I am not personally acquainted with Scinde, but Scinde produces salt almost everywhere naturally, and the duty is consequently small.

4272. In the southern part of Bombay, where you have a different system, is the illicit traffic in salt very extensive also?—Yes; I am inclined to think that it is extensive; in some places very extensive.

4273. Then, with regard to measuring and weighing, I should like to understand the method employed; I understand that in inland dealings the salt is measured instead of weighed?—That was the case until within the last few years; but quite recently a uniform system of weightment has been everywhere established.

4274. Are you aware what proportion the salt tax in Bombay bears to that in France, or other foreign countries, at the present time?—I think that the salt tax in France was recently 1 franc to 10 kilogrammes, which is almost exactly 1 rupee 8 annas per Indian maund, which is just the same as the Bombay tax was till 1869, and the incidence of the tax in France is stated at about 8½ d.

4275. Then am I right in inferring from your evidence that the amount of smuggling of salt in the Bombay Presidency is not so much due to the fact that the limit of just taxation has been reached, as to the peculiar circumstances of the Bombay Presidency?—I think the great cause of smuggling is, that in order to avoid any possibility of a shortness in the supply of salt, or of the people being put to any inconvenience in obtaining it, we have kept up a great number of works, and our system has been generally lax, and the consequence is that I do not think the price of salt in Bombay is at all raised beyond the amount of the tax.

4276. Mr. Beach.] Has dissatisfaction been expressed whenever the tax on salt has been raised?—I think at the time it has been raised, generally there have been some complaints.

4277. In what way has that dissatisfaction been expressed?—I think we judge generally by the native newspapers.

4278. Mr. McClellan.] Would it be expedient, and would it be practicable, to make arrangements to allow salt to be obtained for curing fish free of duty, so as to encourage the curing of fish, and

and enable it to compete with foreign or imported fish?—Yes, I think it would be practicable.

4279. And in your opinion would it be desirable?—I think, to a certain degree it would be desirable.

4280. Mr. J. B. Smith.] Did you state what the duty was on the import of salt fish?—I forget exactly what that duty was. I think 10 per cent. *ad valorem*.

4281. Mr. Eastwick.] Did you state the amount of salt that is used in curing fish; have you any returns of that?—It is usually said that a fishing-boat requires about 20 maunds in the course of a season, but I do not think that is at all a reliable estimate.

4282. There are no reliable returns?—I do not think that there are any reliable returns.

4283. Is the pullah fish introduced into Bombay and then salted?—I am not quite sure; it may be; there is some fish that comes from Scinde to Bombay. The salt tax in Scinde is very low; I think 6 or 8 annas a maund.

4284. Do you think that if the duty was reduced in Bombay, the increase in the consumption of salt would make up for the loss to the revenue?—No, I think not, because the consumption remaining stationary for the last 25 years, the revenue has about doubled; and I do not think it is possible to suppose that our consumption has been checked more than about 25 per cent. by the increase of duties, so that by that computation we should lose 25 per cent.

4285. Mr. J. B. Smith.] Do you know what the duty on salt is in Rajpootana and the neighbouring states?—It is almost impossible to say, because it depends upon the distance which the salt travels. The duty is almost entirely levied by a system of transit dues. If it travels far, the amount of transit dues amounts to something considerable. On the spot, the Government in whose territory the salt is produced generally levies a duty something like the prime cost of the salt, that is to say, if the salt costs 1 anna

to produce, the Government would sell it at 2 annas.

4286. Then it is not likely, under such circumstances, that the native states would enter into any arrangement to stop smuggling, their duty being so much lighter?—Their treasury would be very glad, as a rule, to receive their share of a higher duty. Supposing there was a uniform salt duty imposed throughout India, I think, so far as I know, that the treasuries of the native states would be very glad to receive a share of it. They are generally only too glad to find an opportunity of raising something more from their subjects.

4287. They must raise their duties in that case?—Yes; and I suppose some equivalent tax must be taken off their subjects.

4288. Do you think that that would be objected to?—I think it is almost impossible to say, but the whole of the Guicowar's territory, and the whole of the foreign states within the Bombay Presidency, pay salt tax to the British Government.

4289. The same rate as they do in Bombay?—Exactly the same as in our own territory, the reason being that our power succeeded to that of the Peishwa; and the Peishwa's government had reserved to itself the right of levying salt duty throughout what are now British and foreign dominions.

4290. *Chairman.*] Is the Malwa and Rajpootana salt natural salt, or artificially made?—Some of it is natural salt, but what is exported is chiefly artificially produced from certain salt lakes.

4291. And has to be manufactured?—It is manufactured very much in the same way as our salt is manufactured upon the Runn.

4292. And at about the same cost?—I think as nearly as possible at the same cost.

4293. Is the natural salt cheaper than the artificial?—The natural salt costs nothing more than the expense of collecting it, but it will not bear travelling.

Mr. W. G. Pedder.

12 May 1871.

Mr. CLAUDIUS WILLIAM BELL, called in; and Examined.

4294. *Chairman.*] Will you be good enough to state what appointment you hold in India?—I am in the Revenue Department in the Bombay Presidency.

4295. In the accounts that have been presented for the Presidency of Bombay for 1869-70 there appears, first, for the item for opium, 2,357,000*l.*, and then there is another item of "Excise on spirits and drugs," 446,000*l.*; are you acquainted with the circumstances under which the latter sum is levied?—My knowledge of the excise of spirits is chiefly confined to what are called the Regulation Provinces of the Bombay Presidency; that is, all the collectorates, with the exception of the Province of Scinde and the town and island of Bombay.

4296. What are the items which are included in the excise on spirits and drugs?—The items are, first of all, the duties on spirits manufactured and retailed, and also on the retail of opium, and on the manufacture and retail of drugs, such as ganjah and blang.

4297. Will you state under what system this duty is levied in Bombay, first on the manufacture of spirits and the sale of them?—There are three systems. One is the Sudder distillery

system; but that is not carried to a great extent, it only exists at three towns in the Presidency. Then comes the monopoly or farm system, which is the general system adopted. And the third is what I may call an individual tax system, which prevails in places where toddy-producing trees grow.

4298. Is the Sudder distillery system the same as that which we have had described of a place licensed as a distillery?—It is very much the same as I think Sir Cecil Beadon described the other day. The only difference, I may mention, is, that instead of any one being at liberty to distil in that distillery, a few have acquired virtually a sort of proprietary right in the manufacture of spirits in these distilleries.

4299. And they manufacture at the duty prescribed?—Yes; and they are also permitted to export.

4300. Are they at liberty to supply any place?—By law I think they cannot; but as no one is injured thereby, Government has permitted them.

4301. They have a permit for removing the spirits?—To certain places; chiefly to Bombay.

4302. Then, do they have any right in the retail

Mr. C. W. Bell.

Mr.
C. W. Bell.
—
12 May
1871.

tail of that spirit, or is it purely a wholesale manufacture?—It is purely a wholesale manufacture; but they are also the patrons of the licensed retailers, to whom they supply it.

4303. They have no right to retail in a particular place; that is quite separate, as I understand you?—That is separate.

4304. Then what is the next system?—The next system is rather more complicated; it varies in the several divisions in which toddy-producing trees grow. The trees, as a rule, grow along the coast in a belt, perhaps varying from one to five miles in depth. In some places the toddy-drawing class are permitted, on payment of a certain fee, to tap a certain number of trees. Sometimes a minimum is fixed of the number of trees they may tap, at other times no minimum is fixed; and after drawing the juice, they can either sell it as toddy, or they may erect a still in almost any place they choose, and after distilling the liquor they sell it themselves.

4305. By retail?—Yes.

4306. What is the third system, the system of farming?—The third system is simply a right of monopoly. The right of manufacturing and selling liquor in a district is put up to auction, and knocked down to the highest bidder.

4307. And is the farmer at liberty to erect as many retail shops as he likes?—No; he is limited in the number of shops.

4308. Are the places appointed for him?—The places are appointed.

4309. Is there much competition for the purchase of a farm?—It varies. I have seen competition at times, but I have also seen a great deal of combination.

4310. What do the Government do in the case of combination; do they take what they can get?—From the records of the Government, I think that they have made several attempts to break through a combination when there has been one; and I think, on the whole, they have also been unsuccessful. They have generally threatened not to license the sale of liquor at all in those districts.

4311. So that in those districts the Government have practically put on an upset price which they deemed sufficient, and then they have obtained it?—They generally have.

4312. Have you got any statement of the revenue derived from the three separate systems?—Yes; I have got a statement up to 1867-68, the last year for which I have the returns.

4313. Have there been many changes in the area subject to the different systems, or would any comparative statement of years represent the same area under the same system?—They represent very much the same area. I may say that there have been some changes in detail, resulting in small differences.

4314. Can you state what has been the progress of the revenue derived from spirits and toddy?—Under the Sudder distillery system the revenue was in 1867-68 two lacs.

4315. Have you got any earlier returns?—Yes.

4316. Will you give it 10 or 12 years before that?—It was about 86,000 rupees under the Sudder distillery system in 1857-58, and in 10 years afterwards about 200,000 rupees. Under the individual tax system, the tax on trees, in 1857-58, it was about 85,000 rupees, and in 1867-68 about 2 lacs and a quarter.

4317. Sir J. Elphinstone.] Are these cocoa-

nut trees?—Cocoa-nut and date and palmyra. Under the farming system it was about 7½ lacs in 1857-58, and in 1867-68 about 18½ lacs.

4318. Chairman.] Had there been any change in the duties during those 10 years?—Yes, there has been a change in the Sudder distillery system; the rate has been raised from nine annas to one rupee the imperial gallon. Under the other systems of course there is no duty fixed per gallon.

4319. Is that the present rate?—I believe just lately they have raised it to one rupee and a quarter.

4320. What is the rate of the second system, tax on trees?—Several new systems have been tried experimentally. It has been found a very unsatisfactory system to allow a number of small distilleries and shops to be in one district, and there have been several attempts made to reduce the number of them, and to bring the excise and the manufacture of the spirits generally under control.

4321. And has there been any change in the rate of duty?—The rate is generally placed on the trees.

4322. But has that been the same through the 10 years, or has it altered?—There has been an increase, but not at any regular rate; the chief increase is caused by having made a more careful examination of the number of trees that are tapped.

4323. But was the rate per tree the same 10 years before?—The rate per tree in some districts has been reduced, and in others it has been increased.

4324. Has there been an increase in the sum given for the farm consequent upon the raising of the rate of duty, or how have you secured that increase of revenue from the farming system?—By competition.

4325. Do you suppose it has been influenced by your having increased the rate of duty on the distilled liquor in the other districts?—No, because the influence of the Sudder distilleries is very local.

4326. Do you think that either of these systems at all stimulates the people to drink intoxicating liquors?—I think the monopoly system does much more so, at any rate, than the Sudder distillery system.

4327. In what way is there a stimulus given, do you think, as the result of the system?—The monopolist has his contract, as I may call it, with Government for one year only; he has given a large price for it, and it is his object to make as much as he can during that year. And the two ways in which he finds it most advantageous to attain that object are by selling an inferior quality of liquor and by encouraging the consumption as much as possible.

4328. Does he take any active means to encourage the consumption, or how does he stimulate it?—I have found in some places where the number of shops which he is allowed to hold is limited, that he makes private arrangements with men in other places to sell liquor by retail.

4329. That is surreptitiously, as regards the collector's license?—Yes, surreptitiously, as regards the collector's license.

4330. Does he pay a sum to Government for each license?—He pays a lump sum for the farm.

4331. Therefore as regards the revenue, this fraud

Mr.
C. W. Bell
12 May
1871.

fraud upon the Government would merely be a breach of the prohibition?—Yes, but he is obliged to run the risk of detection and fine, and therefore that necessarily decreases the sum paid in to Government as revenue.

4332. Do they take any active means to stimulate consumption, such as having music or gambling in the houses or verandahs where the spirit is sold, because it is in open verandahs, I presume?—In hovels generally. When the evening closes in, it is generally conducted inside the house.

4333. Either inside or outside, have you any reason to suppose that the consumption is stimulated by gambling or music?—I know cases in which they have musicians in to encourage them to a certain extent, but I do not think it is very much the custom. I think the liquor itself is sufficient attraction.

4334. Is gambling also made use of as a stimulus?—I do not think that the contractor has anything to do with the gambling that may go on in his shop.

4335. That is the affair of the person who keeps the retail shop, you think?—Under the monopoly system the man who keeps the retail shop is the servant, I may say, of the monopolist.

4336. Is he generally a relation of the wholesale dealer, or a mere servant?—The monopolist cannot keep a complete check over him, so, as a rule, he gives him a subordinate share.

4337. The man who actually manages the shop has also an interest in stimulating consumption?—No doubt, although he is returned to Government in the list given by the monopolist merely as his servant.

4338. Have you heard whether there is a greater amount of drunkenness prevalent in the Presidency of Bombay now, than there used to be at any former time?—Drunkenness has increased, but I do not think that the consumption of liquor has increased at all out of proportion to the improvement in the material condition of the people.

4339. Do you mean as to their means of purchasing?—Yes.

4340. But I am speaking now as to their moral condition consequent upon the greater consumption of liquor; has that much deteriorated, do you think?—Well, the classes who chiefly consume liquor, I think, have been pretty nearly always drunkards, that is the class on the coast, the fishermen and the toddy drawers themselves.

4341. They are habitually addicted to intemperance?—Yes, they are habitually addicted to intemperance; but as to the rest of the inhabitants of the Presidency, I may say that they are far from intemperate.

4342. Do you think that the intemperance of those people to whom you have referred has always been the case, or has it been induced in comparatively recent times?—I can see traces of it in the Peishwah's Records of the last century.

4343. That they were in that demoralised condition?—That they were drinkers.

4344. But you do not know whether there is the repute of an increase of intemperance during the last 20 or 30 years?—Undoubtedly there is the repute of it. I have heard it from the non-drinking castes, the Brahmins and others, and also from the missionaries.

4345. Is it their opinion that the state of demoralisation of the people has somewhat increased?—Yes.

539.

4346. Is the large increase of revenue due to the increased quantity drunk chiefly, or to the increased rate of duty?—Chiefly to the increased rate of duty. It is very difficult to estimate the duty in cases where the monopoly is farmed. I have attempted to do so, and on taking an estimate of the total increase within the last 10 years in consumption, I have set it down at about 50 per cent., whereas the increase in the revenue is more than 100 per cent.

4347. Then in the farming of liquor you think that there has not been an increase of the quantity of liquor consumed proportionate to the increase of revenue?—By no means.

4348. Then has the price risen?—The price has risen considerably.

4349. Do you think it is an unfortunate state of things for Bombay that the consumption of intoxicating liquor should have increased 50 per cent., and that the consumption of salt should have considerably decreased?—I may be allowed to qualify the statement that the consumption has increased. A great deal of what is put down to increased consumption is in reality liquor hitherto illicitly sold, which has been brought under the tax by increased energy on the part of monopolists and Government; but I do not think that the consumption of salt has anything to do with it.

4350. As showing the moral condition of the people; while the consumption of salt has diminished, the consumption of intoxicating liquor has increased?—I think that the moral condition of the people is wonderfully high in the matter of drinking, with the exception of those people who inhabit the coasts, fishermen, &c.

4351. You limit it to particular classes?—Yes, and chiefly to those districts where the toddy-producing trees grow.

4352. Sir D. Wedderburn.] Was there any revenue levied from excise during the time of the Peishwabs?—Yes; it was not at first, as far as I can make out from the records, a regular item of revenue; but in after years, that is, towards the end of the last century, I find that it became entered in the accounts as an item of revenue, and also that a great deal of it was paid, not to the imperial revenue, but to the credit of chiefs under the Peishwah.

4353. Was drunkenness punishable under the Peishwah's rule?—Yes, very severely; flogging was not an uncommon punishment.

4354. Do you think that this item of revenue could be increased without stimulating the consumption of intoxicating liquors?—Undoubtedly; but I think to do so a new system would have to be introduced, instead of the monopoly, and of what I have called the individual license system.

4355. Is there any regular excise establishment at Bombay?—I may say not. With the exception of the small island of Salsette, where a new system was introduced in 1864–65, and an excise establishment created, and the three Sudder distilleries, which I have already referred to, there are not 30 £ spent on any special establishment in the Regulation Provinces. The work has to be carried out by the revenue officers and the establishment they have under them for their ordinary work.

4356. Do not you think that the introduction of the Sudder distillery system might prove a hardship to the caste of toddy drawers?—Were you to introduce the Sudder distillery system in those districts where toddy-producing trees grow,

c c 3

and

Mr.
C. W. Bell.
12 May
1871.

and to leave to the toddy drawer the right to retail the juice, either sweet or fermented, I do not think that he would suffer any hardship of which he had any right to complain; but undoubtedly, by depriving him of the right to distil, you would lessen his profit.

4357. Have you estimated the incidence of duty in different parts of the Bombay Presidency, or is it equal?—It is very unequal. I find in some places where these toddy-producing trees grow the incidence of the tax falls as low as 3d. per gallon of proof spirits.

4358. And what is the higher limit?—I have known it to go up to three rupees, but that is a very rare case; as a rule, it goes up to about two rupees.

4359. And how do you account for this inequality?—Chiefly owing to the impossibility of Government regulating the rate as long as these two systems exist, the monopoly and the individual license system.

4360. Is there much illicit manufacture and trade throughout the Presidency?—There is a good deal; especially there is a good deal of liquor imported from the native states in the north; those that border Guzerat, the Guicowar's territory, for instance.

4361. I fancy the irregularity of the frontier especially in Guzerat, is the main cause of that illicit trade?—Yes; you may go through four villages, and find that one belongs to the Government, the next to the Guicowar, the next to the Government, and the fourth to another native chief.

4362. What are the special advantages which you think would be derived from a regular excise establishment, such as you speak of?—Well, you would get a complete control over the manufacture of liquor, which you have not now; you would be able by a simple order from the Government to raise the tax when you thought it was too low, or there was too great a consumption; and you could check the consumption, or increase the revenue by those means. You would also be able to exercise a greater control over the number of shops in a district.

4363. Sir W. Lawson.] Did I rightly understand, from one of your answers, that in prosperous times there was more drunkenness than when people were not so well off; because, I think you said, that the drunkenness had not increased more than was natural in proportion to the increased prosperity?—That the consumption had not increased more.

4364. You did not refer to drunkenness then?—No.

4365. I suppose the sole object of the Government in making any laws about the sale of drink is to get a good revenue?—That of course is one object, but the other object also is to prevent as much as possible an unnecessary consumption of liquor and the increase of drunkenness; at least I find it frequently stated in the Government records that they endeavour, not so much to look for an increase in the revenue, as for a diminution of the consumption of spirits and the prevention of drunkenness.

4366. Do you think that they have at all succeeded in preventing drunkenness by their regulations?—No, I do not think they have.

4367. Their law has failed in that respect, then?—I think it has failed almost everywhere. I do not think it is singular to that part of the world.

4368. Did you ever hear of an association

which existed some time ago called the Madras Native Association?—I am in the Bombay Presidency, and cannot speak as to Madras.

4369. Is drunkenness punished in the Bombay Presidency?—A man who is drunk and disorderly can be punished.

4370. Do you find that there, as here, most of the crimes which come before the courts are connected more or less with drunkenness, or is that not so?—I do not think they are nearly so much connected with it in that country as they are in this.

4371. The drunkenness which exists does not lead to such an extent to crime, as it does in England?—By no means. I could not get any statistical information upon that point, but from my knowledge of the people, I can say with certainty that there is little connection between them. In fact, I find that the man whose trade and business it is to steal drinks, but it is not the drink that makes him a thief; he is a thief by caste.

4372. He probably would be a better thief if sober?—Perhaps so.

4373. Mr. Beach.] Has the revenue increased from the general consumption, or is it owing to a large amount being consumed in particular cases?—I think the increase has been pretty general in the revenue, but not purely so; it has been rather local in consumption.

4374. Is that owing to an increasing taste for it prevailing amongst sailors?—To a certain extent to an increasing ability to pay for it.

4375. There would be more control, I think you have stated, over the houses where it is sold, were the system of monopoly not to exist, and were individual licenses to be granted?—No; were neither the monopoly nor the individual licensing system to exist, and were the system of Sudder distillery substituted, I think that there would be greater control, and the manufacture then would be entirely under the eye of the Government, which it is not now.

4376. Does adulteration prevail much, to your knowledge?—I should think adulteration does not prevail to any great extent, but the means for manufacturing liquor, especially under the individual license system, are so rude, that the liquor is very inferior, although there is no particularly noxious matter in it. It is also a good deal diluted with water.

4377. Mr. Dickinson.] Is the revenue derived from the lease of toddy trees carried to the land revenue, or to the abkari?—There are two rates, I find, in most of the districts where the toddy trees grow. The one, the smaller, is carried to the land revenue, that is called a duty on the trunk of the tree. Then another duty levied also on the tree goes by the name of a tax on the toddy drawers knife, and that tax is credited to the abkari.

4378. What is the effect of tapping a toddy tree on its produce; does it interfere with the productive power of the tree in other respects?—Undoubtedly; but I may mention that that would only affect the cocoa-nut tree; the date trees in India do not produce an eatable fruit, nor is the nut of the palmyra tree used for food.

4379. Are those trees of value for other purposes besides toddy drawing?—Their leaves are used to a considerable extent for matting; the fruit of the cocoa-nut trees of course is marketable.

4380. Does

4380. Does the drawing of the toddy affect the value of the tree for other purposes?—It affects the cocoa-nut tree very materially, because you cannot tap a cocoa-nut tree and also gather fruit from it, but it does not interfere with a certain number of leaves being taken off from the other trees.

4381. How many years is it before a tree will bear tapping?—It varies. The palmyra tree, I find, yields juice from its twentieth year to its seventieth, and the date tree from about its fifth year, sometimes earlier, but generally from its fifth year, up to its fifteenth.

4382. And the cocoa-nut?—The cocoa-nut is very much the same as the palmyra, but I should mention that the cocoa-nut is not tapped to any very great extent; it is only in certain localities that it is used to any great extent.

4383. Would the ground covered by these trees be ground valuable for ordinary purposes of cultivation?—Undoubtedly, if the trees are removed, not if the trees are allowed to grow there.

4384. Is it a profitable occupation of the ground that they are occupied by these toddy trees?—Certainly.

4385. What is the produce of the palmyra tree, is it tapped every year?—The palmyra tree can be tapped for two months in the year certainly, and would give an average of five seers daily for two months, that would be 300 seers in the year.

4386. What is the revenue derived from that?—It varies in different places, sometimes 6 annas, and sometimes it goes as high as 2 rupees, or 2½ rupees the tree.

4387. That would not be for a tree producing the same amount of toddy?—No; the tree that I have estimated the produce of would be assessed at about 2 rupees.

4388. And what do you say the retail price of that would be?—It varies a good deal. I should think the man would sell it at about 7 rupees.

4389. Do you know at all the ground which the palmyra covers; how many would go to an acre?—I cannot remember at the present moment. I should think 80 would grow on an acre.

4390. I suppose that the proportion you have given us would give a good idea of the out-turn both to the Government and to the individual, of the toddy-growing tree?—Yes, he has his labour to come out of that.

4391. Sir J. Elphinstone.] You said that there was not much adulteration of spirits in your Presidency?—Not as I understand adulteration, that is to say, by adding noxious matter.

4392. What are the substances that they usually adulterate with; bhung, or opium, or tobacco?—Not to a great extent. They sometimes put in the bark of an acacia tree as a bitter.

4393. The seafaring classes on the Bombay coast have always been addicted to liquor, have they not?—Always.

4394. In fact the sailors there are very much like our own in that respect?—They are the finest men that we have.

4395. But they imitate European sailors very much in those habits, do they not?—They are like them, but I fancy that they had a knowledge of drinking as early as the British sailors.

4396. Have the modes of distillation that have come under your observation been improved at all of late years?—Except to a small extent in Sudder distilleries there has not been the slightest improvement.

Q. 59.

4397. The Government do not interfere to prescribe any particular mode of distillation or refining of spirits, do they?—No.

4398. Has it ever come to your knowledge that in those distilleries the rectifying process is very imperfectly carried out, expelling the noxious parts of the spirits, the portions of the spirits that act so deleteriously upon the human constitution?—I have seen no attempt to do anything of the kind. (I am talking of country spirits entirely.) The only instrument used is a retort of a better or worse description, according to the means of the manufacturer.

4399. Just the rude mode of distillation which exists in smuggling distilleries in this country and Scotland and Ireland?—Yes, the farmer is able to use metal retorts, and so is the manufacturer in the Sudder distillery; but even in the Sudder distillery the whole apparatus is very rude.

4400. The Government do not prescribe any more advanced mode?—No.

4401. Is there any arrack now distilled for the use of the troops and for the use of the Government?—There is a distillery at a place called Bhandoop, which is situated about 20 miles from Bombay.

4402. Is that near Tannah?—Yes.

4403. Is the process of distillation in that distillery of a higher character?—Very much higher.

4404. Is the produce from the juice larger than it is in the native distilleries?—All superior apparatus are economical in their working; but this arrack is not distilled from the juice of toddy trees, but chiefly from imported dates.

4405. Supposing the Government were to prescribe a superior mode of distilling as they have done in this country, what effect do you suppose that would have upon the revenue?—As matters now stand you could not prescribe a particular method which would involve great expense, because the interest of the manufacturer is only from year to year, and he could not afford to go to any great expense; but had he a certainty that he would have a license for a considerable term of years I think that there are many men who would be found who would go to the expense of a superior apparatus, and the result would be that you would get a better liquor manufactured more economically, and the Government would be able then to place a considerably higher duty upon it.

4406. If the manufacturers, as I may say, were more centralised, it might probably pay the Government to put an officer into each distillery in the same way as it does in this country?—Undoubtedly.

4407. And that would greatly add, not only to the produce and the quality of the spirit, but also to the certainty of the revenue?—Undoubtedly.

4408. If the manufacture of spirits was not carried on, they could carry on the manufacture of jhagery, or coarse sugar from these trees, could they not?—An attempt was made formerly to extract jhagery, but it was not successful. Whether the juice had not sufficient saccharine matter in it, or whether the manufacturers of coarse sugar could not enter into competition with the liquor distiller, I cannot exactly say. It was a long time before I went to India.

4409. The extent of land in the Bombay Presidency, where those trees which you have specified

Mr.
C. W. Bell.
13 May
1871.

Mr.
C. W. Bell.

12 May
1871.

specified grow productively, is comparatively small, is it not?—It is of great length.

4410. But comparatively small in proportion to the requirements of the Presidency?—Yes.

4411. You are perhaps aware that in the south of India the production of jhagery has led to important refining establishments being created and worked profitably?—Yes.

4412. But that is not the case at Bombay?—No, the produce of the trees, I may say, that grow in the gardens, I believe, could be made into coarse sugar, but those that grow naturally on the coast without irrigation could not be remuneratively used for that purpose.

4413. A great part of the country that they grow upon is, if I recollect rightly, stony and dry, and sandy?—Yes, very dry.

4414. They require not only the vicinity of the sea, but the presence of fresh water to produce very largely?—Yes.

4415. You have stated, I think, that there was in closely planted districts about 60 trees to the acre?—I think there might be; I have not got any data.

4416. They grow more thickly in the soil that they find just adapted to them?—Yes.

4417. Now, the ground under the trees is valuable for pasture as well as for other things, is it not?—Yes.

4418. And is that taken into account upon the valuation of those lands?—The assessment on the land is quite distinct from the assessment on the trees.

4419. In connection with an improved mode of distillation, and bringing it more directly under the influence of the Government, how would you be disposed to view a uniform duty per gallon upon proof spirits?—I think that ought to be the end aimed at.

4420. Then, I generally understand you to say, that you would approve of having larger and more central distilleries more under the control of the Government, and a uniform duty upon the produce?—Yes.

4421. Mr. Lyttelton.] Have these common native spirits any medicinal value?—The natives consider that they are very comforting in time of illness, I believe; for I find in the license a special clause, that after the hour at which the shops must be shut, liquor may be sold by the retail seller in cases of sickness under a pass from the head man of the village; whether it is attended with any actual benefit or not, medicinally I am not prepared to say.

4422. Are you aware that a moderate use, even of the commoner description of the native spirits is not deleterious?—I do not think it is, judging from the physique of the men; the coast district men, who are exposed to a very heavy rain-fall, drink a considerable amount of spirits, I think that it has had no deleterious effect upon their constitutions whatever.

4423. Do Europeans acquire a taste for the native spirits?—Only when they have fallen very low.

4424. They are excessively unpalatable, I believe; the taste must be an acquired one?—The liquor is not unpleasant; it has got no particular flavour; it's wanting in taste.

4425. You are quite prepared to say that native spirits, to as great an extent at least as spirits in England, are a necessary of life?—I think so, on the coast district especially, because the people

there are subject to a heavy rain-fall and its concomitant fever.

4426. Mr. Eastwick.] Could you give us an exact and accurate estimate of the revenue derived from an acre of land, and of its returns to the owner; because I think, according to your statement, the revenue would derive 120 rupees from an acre of land of 60 trees, and there would be 420 rupees for the seller of the liquor?—Yes.

4427. Is not that a considerable sum, as compared with the produce of an acre in other crops?—The whole of these trees could not very well be tapped in the same year.

4428. Could you give an exact estimate of that?—It is almost impossible to give it by the acre.

4429. You could give it by the single tree only?—Yes.

4430. That you could state how many trees out of 20, or out of 60, would yield produce during a year?—Yes.

4431. It would be rather an exaggerated estimate, would it not, that an acre of toddy trees returned 120 rupees revenue, and 420 rupees to the distiller?—Well, there is a great deal that has to come out of that 420 rupees.

4432. But independent of that, would not that be an exaggerated estimate?—I should think it is; I am not quite sure of the number of palmyra trees that will grow on an acre, but I think the following figures show pretty accurately the average value of the produce of these trees to the toddy drawer. One man can tap 20 palmyra trees in the season. These in garden land will yield 200 maunds of juice; 200 maunds of juice will produce 66 maunds of spirits, which at 3½ rupees the maund, gives 206 rupees; deducting the tree-tax at two rupees the tree, there remains 166 rupees for expenses, profit, and payment of labour. The same number of uncultivated trees will yield 200 maunds of juice, equal to 33 maunds of spirits, retailed at 103 rupees; deducting tree-tax at four annas the tree, there remains 98 rupees for expenses, &c.

4433. What is the time of year that they tap these trees?—There are two seasons; one in our autumn, about November, and the other about May.

4434. And do they last for about two months each time?—I should mention that that is with regard to date trees, they last for a limited period. The date tree yields during the two seasons, two months in one season, and one month in the other; but it is not continuously tapped, it is only tapped for 10 days at a time, and then allowed to rest for 10 days. It yields continuously for about two months.

4435-45. And how does the toddy drawer during the other periods of the year get his livelihood?—Many of them have pieces of land which they cultivate; others work in different ways, sometimes as cart men, sometimes as cutters of wood.

4446. They would not be thrown entirely out of livelihood for the rest of the year?—As a rule they do very little else than toddy-drawing.

4447. Have you made any estimate of the expense of establishing an excise establishment in abkari; and do you think that, deducting the cost of such an establishment from the revenue, it would be a gain?—A decided gain, even then. I do not think that at any time an excise establishment would exceed 5 per cent. I speak, of course, without perfect knowledge of the matter; but

Mr.
C. W. Bell.
12 May
1871

but I should say roughly that 5 per cent. would be the extreme charge on the abkari revenue from the excise establishment. The revenue in time would, by raising the duty by degrees, nearly double itself.

4448. I think you said that the fishermen and sailors were the people who chiefly took the spirits; but the Mahrattas do also, do they not?—They are Mahrattas.

4449. But also the Mahrattas in the hill country use spirits?—Yes, the hill tribes; but the Mahratta cultivators in the Deccan are very abstemious.

4450. (*Chairman.*) With regard to the opium; what is the amount of revenue derived from the licenses for the retailing of opium in Bombay?—In the Regulation Provinces in 1867-68 it was about a lac and a-quarter.

4451. Is that for the annual license?—Yes.

4452. And is there any tax upon the opium itself corresponding with the duty that is levied on the foreign opium?—The license is put up to auction, and the successful bidder is bound to supply himself with opium from the Government stores. This opium is supplied to him at a price which includes the duty.

4453. What are the other items, bhang and ganjah?—They are opium preparations of hemp. There are also other drugs prepared from hemp and opium.

4454. And are the licenses for the sale of those granted in the same manner?—Yes, to retail dealers.

4455. Is there any license put upon the decoction or drink; or is merely the duty collected from licensing the shops?—It is merely a duty collected from shops.

4456. Does the collector regulate the price at which the license is to be granted?—Yes; but I should mention that the manufacture of bhang and ganjah also comes under abkari.

4457. Do you mean that people are not allowed to manufacture it except under license?—I find that the law is almost silent on the subject, and that the practice is very irregular; but only in two districts is there any attempt whatever to check the growth of hemp or the wholesale of bhang and ganjah.

4458. What was the amount derived from bhang and ganjah?—In 1867-68 it was under half a lac in the Regulation Provinces.

4459. Sir *D. Wedderburn.* Is it long since the cultivation of the poppy was suppressed in Bombay?—It was suppressed in 1838.

4460. And had that a great effect upon the retail sale?—It seems to have had an effect, because, when I looked into the question, I found that for the three years previous to the suppression of the cultivation of opium there was an average of 381 maunds of opium given out to the retailers in the Ahmedabad collectorate alone, whereas, for the three years that succeeded it, only 126 maunds of opium were given out to retailers.

4461. Is there not reason to believe that, in

Guzerat especially, there is a large consumption of opium in excess of that furnished by Government to retail dealers?—Very large. In that same collectorate of Ahmedabad in 1867-68 the amount given out to retailers was only five maunds.

4462. And in Guzerat a great deal is known to be consumed in excess of that furnished by the Government?—Yes.

4463. Could you form any estimate of the loss to the revenue by that illicit consumption?—Putting it at a very low figure indeed, the amount of opium illicitly retailed in the Regulation Provinces, if subjected to duty, would bring in three lacs of rupees.

4464. That is double what is now realised by opium?—Yes.

4465. Do you think that there is any capability of expansion in the revenue to be derived from the other drugs, ganjah and bhang?—I think that they are expansive items, if there were some arrangement made for regulating the growth of hemp, and the sale in bulk of these articles, as is done in Bengal at the present day.

4466. Sir *W. Lawson.* All the Malwa opium passes through Bombay, does it not?—Yes; almost all.

4467. Do you know anything about the condition of the people who grow it in Malwa?—No; I am confining my evidence to the retail sale of opium.

4468. Mr. *Beach.* Is the revenue on opium in Bombay derived from a transit duty chiefly?—Yes.

4469. Does the system of advances to the cultivators prevail there?—In a very small portion of one district of the Bombay Presidency there is a little cultivation, but as a rule the growth of the poppy has been totally suppressed.

4470. To what do you attribute the falling off of the revenue at Bombay from this item, because the revenue in Bombay has rather fallen off, and it has rather increased in the Bengal Presidency?—My knowledge is almost entirely confined to the retail sale of opium when it comes into the Presidency. I have not yet got a sufficient knowledge of the wholesale opium trade to offer an opinion on it.

4471. Mr. *Dickinson.* Practically, the whole of the revenue from opium on the Bombay side is derived from opium grown out of our territory?—Yes.

4472. In Malwa, in fact?—Yes.

4473. Do you know anything of the arrangements in Malwa respecting the growth of opium?—No; I mentioned that my knowledge was chiefly confined to the retail of opium for consumption by the inhabitants in the Presidency.

4474. And you cannot tell the operation of our export tax where there is a tax levied on the opium?—On the frontier. We have got agencies also, I believe, in certain districts, which provide passes on payment.

4475. And is the money received there or in Bombay?—I am not able to state that.

Sir DONALD FRIELL McLEOD, K.C.S.I., C.B., called in; and Examined.

4476. *Chairman.* Will you kindly state what superior offices you have held in India?—In the Punjaub I have held, first, the office of Financial Commissioner from 1854 till 1865, and from 1865 till 1870 that of Lieutenant Governor.
0.59.

4477. In the accounts for the Punjaub, there appears to have been a gross revenue of 923,000*l.* derived from salt in 1869-70?—Yes.

4478. Will you be good enough to explain to the Committee under what circumstances that revenue

Sir
D.F. McLeod,
K.C.S.I., C.B.

Si
D.F.M^{le}Lead,
K.C.S.I., C.B.
—
12 May
1871.

revenue was collected?—The largest portion, I think, was collected on the preventive line, that extends from the Sutlej on the north to the confines of the North Western Provinces. The latest date for which I have taken any memorandum with regard to the amount is 1868-69. In that year about 422,000 L. was levied on that line. The next most important method of levy is from the salt mines. On them there was an income of 378,000 L., only a little less than the other.

4479. Are those the whole sources?—They are the principal ones, and almost the entire ones. Across the Indus, there is another class of mines, which pay a very much smaller rate of duty, called the Kohat mines. They realised in that year only 8,000 L.

4480. Will you be good enough to explain in what manner the salt mines are worked to produce the revenue which they do?—A duty of 3 rupees the maund is levied upon the salt, and from this year I believe that 3 rupees 1 anna will be levied. Heretofore, the cost of excavation, which is very slight, has been borne by the Government, and I see from the last report of the Commissioner of Customs and Salt, Mr. Hume, that it has been determined now that the cost of excavation shall be borne by the purchaser; the Government is to levy its entire duty irrespective of the cost of excavation.

4481. Does the Government own the mines and employ people to excavate?—Yes.

4482. So that there is no private enterprise in the production of the salt?—None at all.

4483. Can you state what the cost has been per maund or per 100 maunds, of obtaining the salt apart from the estimated duty?—Mr. Hume states, as far as I understand him, that it is about 2 s 2 d. a ton as the cost of excavation. I believe that is what he means. I am not quite certain about it; but at all events it is something very trifling; so trifling that no difficulty whatever was anticipated in transferring the burden of it to the purchaser.

4484. Is the salt sold as it is excavated without preparation?—Yes, the greater part of it is exceedingly pure.

4485. Is the supply unlimited, so that it will last for generations?—It is practically unlimited; it will last for generations to come.

4486. Is there any facility for distributing the salt from the mines, or is the transport from them costly?—The transport has been heretofore somewhat difficult. The introduction of railways of course will put an end to those difficulties. As yet the bulk of it is carried upon camels' backs from the mines chiefly to Amritsir, by far the largest part to the city of Amritsir, which is near Lahore, and from thence it is distributed to other parts; but it is a journey of 150 miles, I suppose, from the mines to Amritsir, and has to be carried either on camels or in carts, and on an insufficient road. The direct road from Amritsir to the mines is only capable of being used in fair weather. A portion of the salt is conveyed down the Rhelum River, on which the mines are situated, to Mooltan.

4487. Do the merchants purchase entirely at the mines, or does the Government take any means to distribute the salt?—No, it is entirely purchased at the mines.

4488. Where does the salt come from across the frontier, which produces the rest of the revenue?—Those mines are situated in the hills of the trans-Indus territory. In fact, it is a con-

tinuation of the salt range. But the salt produced in them is of a different character; it is called black salt; it has a greyish colour, but is, I believe, practically, almost as pure as the other. The levy on it, however, is insignificant (from 6 d. to 1 s. per maund), and a considerable amount of it goes to the chiefs in whose territory the mines are situated.

4489. Then that duty is, I suppose, upon it when it passes the frontier?—It is not allowed to come over; it is contraband on the Lahore side of the Indus.

4490. You are speaking now of the small salt mines?—Yes.

4491. Why are you not able to levy the same duty on that salt as on the other?—From political considerations entirely. It has been frequently advocated by some of our officers, that it should be raised; but this proposal has always been strongly opposed by Lord Lawrence, when he was Lieutenant Governor and Chief Commissioner, and by most of our authorities, as a very dangerous measure, and not worth the liability of disturbance.

4492. But why does it not come more largely into consumption, seeing that the cost of it would be so much less than the other?—Because it is not allowed to come across the Indus. If it is found within the Indus, it is at once confiscated, and the person punished. The salt is sent in the other direction from these mines, and the charge is paid on that.

4493. Where does the salt come from which passes the frontier upon which you levy the rest of the salt duty?—That is all south of the Sutlej. North of the Sutlej, the country is entirely supplied from the salt mines. South of the Sutlej, it is produced in various parts of Rajpootana: the largest quantity upon the Sambhur Lake and other portions in various places. But the whole of the salt that crosses that line is produced in foreign territory.

4494. What rate of duty is levied upon the salt crossing the frontier?—Three rupees a maund, the same as at the mines. This year there is to be a slight increase of an anna, I think.

4495. Do you know what the price of that salt is at the frontier, apart from the duty; what is the cost or value of it at the frontier, because it has been conveyed a considerable distance by the time it reaches the frontier?—Yes; the only means you have of judging of that was from its selling price after it passed the frontier.

4496. What would that be including the duty, or without it?—Mr. Hume states that, practically, our duty only amounts to about half the cost of the salt. He gives a table showing the cost of the salt in different localities in retail.

4497. Nearest the frontier what is the price of the salt?—Nearest the frontier it amounts to about a halfpenny a pound, and rises in the most remote parts to about 3 d. a pound.

4498. Does the consumption of this salt extend until it meets the salt from the mines?—Yes.

4499. Where the prices of the two would be the same?—Yes; there has been a very strong inclination of late years to extend the rock salt, it is so much purer than the other. There has been a great inclination, as means of conveyance have improved, to extend it into the country southward.

4500. But

Sir
D. P. M'Leod,
K.C.S.I., C.B.

12 May
1871.

4500. But do the Government take any steps to push the consumption of one salt rather than the other, or is it regulated entirely by commercial considerations?—Entirely by commercial considerations. Lord Mayo has, however, taken a great interest in improving the production from the Sambhur Lake and others, and is forming railways expressly for the purpose of conveying salt, and that will no doubt tend to interfere *pro tanto* with extension southward of the sale of rock salt.

4501. Have you made any inquiries to ascertain what is the consumption of salt per head of the population in the Punjab?—Yes; the population of the Punjab north of the Sutlej at the present time is about thirteen millions and a half, and the product of the salt mines is very nearly 120,000,000 of pounds; so that, assuming that the whole of the population north of the Sutlej are supplied from the salt mines, that gives an average of 9 lbs. per head. But that is a very rough calculation, because a considerable part of our province, the Kangra district, is supplied almost entirely from some mines in the native state of Mundi, which pays us no duty at all; and on the other hand, a large part of Cashmere, and some other foreign territories, are supplied from our mines. But I think the probability is that 8 lbs. or 9 lbs. a head very nearly represents the consumption, including whatever cattle may take.

4502. Is the salt sent into Cashmere charged with the duty?—Yes, that which they take from our mines. It is asserted by our Custom officers, (but I never could verify it myself) that they are convinced that a great deal of the black salt is smuggled across the Iluzara district into Cashmere; but I very much doubt its being the case to any considerable extent, and I know that a large part of Cashmere is supplied from our own salt mines. I have seen many of the Cashmere population carrying it away on their heads.

4503. Have any attempts been made to ascertain by inquiry what is the actual consumption by people for any castes or classes?—I do not think that it has been attempted in detail, as regards individuals further than general calculations resulting from comparing the population with the production of salt. But Mr. Hume evidently, from a table that he gives in his last report, has made some particular inquiries, for he states that excluding the quantity consumed by cattle, each adult person in the whole of the territory that he is concerned with, that is chiefly the Punjab, with the North West Provinces and the Central Provinces and Oude, consumes on an average about 8½ lbs. (8·64 is what he gives); and each child one-half of that, which would give an average of probably from 6 to 7 lbs., exclusive of cattle.

4504. Do you think that that is the result of an investigation of the purchases by families?—No, I think not. I am inclined to think that he has dealt with it on a large scale; but he does not enter into detail. A few years ago, the late Mr. Roberts, who was then financial commissioner, made, I think, considerable inquiries from a strong impression on his mind, that the duty prevented people obtaining a sufficient supply; and he reported his opinion to Government to that effect; but I do not think that he drew up any detailed information of a reliable character to show what they actually consumed. At the annexation of the Punjab, or very shortly after

it, the Board of Administration expressed the belief that the utmost that a common working man could require would be about 1 lb. a month, and the actual supply that they have received is certainly something less than that, probably not much above half of it.

4505. Do you know what sum is actually paid for salt: what price the ordinary workman pays in the central part of the Punjab?—Mr. Hume estimates it as a poll tax of about 6½ d. per head in the year; and he considers that it falls upon the population at that rate however applied, whether for the feeding of cattle or themselves. That is merely arrived at by dividing the population into the actual production; and relatively to the cost of the salt as it reaches the natives, he estimates that they pay upon the average 6½ d. in the year for it.

4506. Can you tell us what the earnings now are in the Punjab of the lowest condition of the people (the unskilled labourers)?—It is rising very rapidly; but I should say it is about 3 d. a day for an ordinary labouring man in the country. In the towns I have known it as high as 1 s. a day of late years.

4507. Sir D. Wedderburn.] Do the Rajpoot princes levy any duty upon salt for their own purposes?—They levy transit duties.

4508. On the transit over the frontier?—Yes. There are a number of small chiefs through whose territory it has to pass, and I believe all or most of them levy a transit duty if they can.

4509. But there is no excise duty levied by them?—I will not be certain of that. The Government has entered into full inquiries with reference to the Sambhur Lake, which is by far the principal source of supply, and I believe that some limited amount of duty was levied by the chief; but we have entered into negotiations with him, and he has agreed to make over the management of the Sambhur Lake to us on certain considerations. But I think it is quite clear that if they were to levy a duty, such as we have done upon our salt mines, upon the salt that is produced in their territory, our Customs duties levied upon our line could have no existence.

4510. Mr. Beach.] What is the Customs duty levied on our frontier on native salt?—Three rupees a maund, that is, 6 s. for 80 lbs.

4511. Exactly the same as the Excise duty?—Yes.

4512. Is there any difficulty in preventing salt being illicitly introduced?—Practically, I think, none at all. As regards the rock salt, there is a singularly small amount of smuggling; it may be said hardly to exist. The existence of these mines, and their being the only source of supply north of the Sutlej, gives the Government great command over the matter, and it is very remarkable, because that salt is so abundant that you everywhere see it cropping out; it is quite visible to the public. In some of our towns, especially at Kalabagh and Mari, which are on the Indus, where a large quantity of salt is produced, the houses are actually built upon the salt formation, and yet there seems to be no smuggling.

4513. Does the tax seem to press heavily upon the population?—I do not think so; I have never found that, and I think that all the data we have are opposed to the idea, but many people do assert it. When we first took possession of our salt mines, we levied two rupees a maund in 1849-50; I believe that is more than ever had

Sir
D.F.M. Leod,
R.C.S.I., C.B.

12 May
1871.

been levied by the former Government, although we endeavoured to approximate as much as we could to their duty. Their management was very irregular and the precise amount of impost difficult to ascertain. But in the first year our income rose from 80,000*l.* to 153,000*l.*, which certainly seemed to show that at that time the levy of two rupees did not act at all as a preventive. Then in 1860 we increased the levy by a sixteenth. We levied *Rs.* 2. 2., and the sale still increased; so far from decreasing, it actually increased. It was 216,000*l.* that we realised in 1859-60, and 273,000*l.* and odd in 1860-61, the year that we increased the duty. Then the following year we increased it to 3 rupees a maund, and in that year 254,000*l.* was realised. However, it will show more the actual state of the case if I state the quantity of salt. It had been in previous years 9 lacs and 10 lacs of maunds, or a little over. In 1860-61, the year that we made the first increase, very nearly 13 lacs of maunds were sold. In the next year it fell to 10 lacs, which would seem to show that there was a fall for that one year. But the amount sold in 1861 and 1862, after the full duty of 3 rupees had been fixed, was greater than in any year previous to 1858-59. So that it has appeared to me on that ground that there is no reason to suppose that the duty acts as a deterrent to purchase; and the small quantity of smuggling, I think, is another argument that indicates the same thing. I have never myself heard any native complaint of it, and I have frequently heard natives of intelligence express their admiration at our skill in obtaining so large a revenue as we do from such an insignificant article as salt. They never seemed, as far as I could ascertain, to entertain the belief that we were oppressive in the matter.

4514. Would it be considered oppressive if it were increased at all?—I think it has reached the limit of what it would be advisable to realise, though I think it is very possible that more might be taken without creating any considerable amount of discontent; but, taking all the circumstances of India together, I doubt whether it would be advisable to raise it more than it is now. I think it is quite practicable to raise it to some extent if it were desired on financial grounds, but in that case it should be done elsewhere as well. In Bengal it is something higher than we have it in the Punjab, and there the consumption is still greater, a larger consumption per head considerably.

4515. Is there any practical inconvenience from there being a different rate of duty in different parts of India?—We have never experienced it in the Punjab, for in point of fact we have no difference except that which I mentioned of the trans-Indus salt, and that obliges us to keep up a customs line to prevent its being introduced; but beyond that the rates are uniform and the Punjab is not affected by rates in other parts directly. I daresay it is indirectly; large quantities are exported from Bengal, but I do not think that it ever comes so far as the Punjab frontier.

4516. How near does the East India Railway come to the salt mines?—Delhi from the mines must be 450 miles, I suppose.

4517. Then no salt is conveyed by that railway from the mines?—By the Punjab and Delhi Railway down to Delhi, and even into Oude, I believe, a good deal has found its way.

4518. Does the railroad convey it, or is it conveyed by river?—We have almost no river conveyance in the Punjab; the rivers are very impracticable, and certainly no mode of conveyance at all competes with the railway.

4519. How is it conveyed to Delhi?—We convey it, as I mentioned, from the mines to Amritsir or to Lahore upon camels and in carts. From Amritsir it is conveyed by railway down the country. Into other parts of the country where it has to be conveyed they have to convey it upon bullocks or otherwise. At present we have one railway from Lahore to Calcutta and another to Mooltan.

4520. Mr. Dickinson.] The Bengal duty is higher than yours?—Yes, a little.

4521. Can you state at all the point between the Punjab and Calcutta where the two commodities meet one another?—No, I cannot; I doubt whether even Mr. Hume, the Commissioner, could tell you that distinctly.

4522. I suppose in the higher part of the valley of the Sutlej you can provide salt cheaper than they can at Calcutta?—I should think that, as far as Allahabad, the Calcutta salt would come; but I have never heard of its being brought higher. Then the salt that meets it there is not the salt generally of our Punjab mines, but salt that is brought across the frontier from Saubhur and other parts with the duty levied upon it, down as far as Delhi, and beyond it; and also the line goes away down there, and it is that salt that comes in contact with the other.

4523. The North Western Provinces are supplied with salt partly from the Punjab?—Very little from the Punjab; partly, perhaps, from Calcutta.

4524. Chiefly from where?—Chiefly from these Rajpootana productive mines, and the mines that are brine pits, in fact, near Delli. There is also now, I believe, in Oude itself, and certainly in some of the native states, earth salt produced very largely.

4525. That is all, I suppose, subject to excise duty?—All that is produced by ourselves; we levy an excise upon it at the brine pits; but with regard to what is made in Bhurtore and elsewhere, and in Gwalior, I do not think that we have any effective means of levying a duty upon that, but I do not know exactly the arrangements made. It did not concern the Punjab, and did not come under my cognisance. But I know that it was a matter of great solicitude to the Commissioner of Customs how to prevent the earth-made salt competing with the dutiable salt.

4526. You speak of the Punjab salt?—Yes; the Punjab Government receives a larger revenue from Rajpootana salt, which passes across the line from the Sutlej to Delhi and beyond, than it levies from our mines; they are very nearly equal.

4527. Then it crosses the Punjab frontier on its way to the valley of the Indus?—It comes from the westward, from the direction of the Indus.

4528. But it does not supply the Punjab?—It supplies three divisions of the Punjab certainly, viz., the Cis-Sutlej, Hissar, and Delhi. The great bulk of that tract is supplied with salt brought across from Rajpootana.

4529. It can supply that part of the Punjab cheaper than you can buy salt from your salt mines?—Yes; but of late years there has been a great

a great inclination towards the extension of the limits to which the Punjab salt has reached. Mr. Hume mentioned that the levy of duty upon the line has been very perceptibly influenced and diminished by a further extension of the rock salt.

4530. Mr. J. B. Smith.] I think you stated that notwithstanding the increase of the duty on salt, the revenue increased, and the quantity consumed also increased?—Yes.

4531. How do you account for that?—We have had two censuses made of the Punjab in the last 15 years. One was made in 1856 under my own superintendence, and the second was made in 1868, 12 years after, and so far as these censuses can be relied upon (and to the best of my belief they are fairly reliable) there has been an increase of nearly 3,000,000 of the population in those 12 years. At the first census it amounted to 14,766,825, and in 1868 it numbered 17,593,946, giving an increase of 2,827,125, besides which, I have no doubt that cattle have also increased, and the means of people to spend lavishly have increased, so that I am not at all surprised at the increased consumption.

4532. Has the increase in the consumption gone on *pari passu* with the increase of population?—I think it may be about the same; yes, it has increased fully as much. It has increased from 768,000 maunds in the first year to 1,497,000 maunds; it has nearly doubled, but the increase has been gradual, and the last year of which I have a return, 1869–70, there was an increase of upwards of 200,000 of maunds in the year, so that these fluctuations render it impossible to speak with great certainty on the point.

4533. The increase in the consumption has been about doubled, whilst the increase in the population has been about 20 per cent.?—Yes.

4534. You stated that in some places salt was sold as high as 2 *d.* or 3 *d.* a pound, on account of the expense of carriage?—Chiefly so, and also I presume on account of the levy of duties in the native states through which it passes.

4535. Now, have there been any railways or roads within that time that you speak of which have diminished the cost of the carriage of salt?—Yes; from Lahore to Delli.

4536. Do you know whether much salt has been carried on that railway?—I believe very largely. I am not in possession of the returns, and I cannot say how much, but there is no doubt that salt does travel by it. And then, from a new railway which has been lately projected, the State railway, as it is called, to the north, going from Lahore to Peshawar, it is intended to make a branch railway to the mines especially for the conveyance of salt; and it is looked to as one of the chief sources of income of that line.

4537. Then there is no doubt that the diminished cost of carriage of salt has added to consumption?—It is only of late years that the railways have been available, and the increase of consumption has been progressively regular, so that I should not be prepared to say that the reduced cost of carriage has materially increased the consumption, especially as our duty has been increased, and the cost of salt at Lahore now must be half as much again as it was at first. I think that it at first was from 16 to 18 seers the rupee at Amritsar; it is now about 10 or 12.

4538. Why should the price be increased?—Our duty has been increased to 50 per cent., and 0.59.

that of course is a very material element in the price of salt.

4539. But you have stated that, notwithstanding the increase in the duty, there has been an increase in the consumption of salt?—Yes.

4540. You say that the price of sale has risen there on account of the duty?—Yes.

4541. But it has risen everywhere else in the Punjab on account of the duty?—Yes.

4542. Notwithstanding that, the consumption of salt has increased?—Yes.

4543. Then, I want to know whether that increase has not arisen from the diminished cost of obtaining the salt by means of railways?—No, I think not.

4544. Although you state that there is a very considerable traffic on the railway, you think that has had no effect in increasing the consumption of salt. Very little appreciable effect as yet. It seems to me, judging from the return, that the cost of salt is so very small that there is no appreciable effect upon the consumption as yet; in the Punjab, when it has been low, the consumption has been the same, and when it has been increased the consumption has gone on the same.

4545. And whether the salt cost 1 *d.* a pound, or 3 *d.*, you do not think makes much difference?—No; Mr. Hume states that the average levy upon each individual is 6½ *d.*, and whether you make it 2 *d.* or 3 *d.* more during the year, I think will not tell upon the consumption, and certainly the increase has not tended to diminish the consumption in any respect in the Punjab, nor to encourage smuggling. I think that those are two very great evidences that it does not bear heavily on the people. Some people assert that the quantity that our people get, 6 or 7 lbs. in a year, is not sufficient; but I have never heard it stated on what grounds that is asserted. I have never heard any medical grounds alleged as really proving it. It may be so, but I have no means of stating. I have heard it stated that the cattle disease has sprung from their not having a sufficiency of salt, but I am incredulous myself on the point. I think the cattle disease has existed just as much in those countries that have abundance of salt.

4546. But 6½ *d.* a year for salt, which at 1 *d.* a pound would be a consumption of 6½ lbs. a year, would be a small consumption?—It seems so to me.

4547. We have it in evidence that in some places it is 12 lbs.?—Yes; in Madras and the south of India. I think it is possible that there may be something in the circumstances and climate requiring a greater consumption there. I know that the people in those parts consume an immensely larger quantity of spices and other stimulants than they do in the Punjab.

4548. You think that the people in the Punjab have as much salt as is necessary for them?—They seem to think so themselves, and I have never heard any complaint to the contrary, or seen any evidence to the contrary.

4549. (Chairman.) Perhaps the food in the Punjab consists more of corn or wheat?—The bulk of the population throughout India are corn eating; but I think they feed better in the Punjab than they do in other parts; and in the south there is greater necessity for stimulants.

4550. Does that arise from rice being largely used, and requiring condiments?—Yes, I think this probable. I have had an escort of Madras

Sir
D.F.M. Lead,
K.C.S.I., C.B.
12 May
1871.

sepoys, and have been struck with the difference in the mode of diet. They are very fond of dried fish; and if you deprive them of spices, they go almost frantic about it. I have known the above escort rush into the fields for spices, and tear them up, when they have failed to get them in the shops, in some of the wild districts, as if they could not exist without them. You see nothing of the kind in the Punjab. It is possible that the same thing may apply to salt.

4551. Mr. Lyttelton.] Have you found that the poor man consumes as much salt as the rich man?—I do not think so, personally; but I think that a great deal more salt is used in the household of a rich man than in that of a poor man. I daresay there is a great deal more waste; but I am not competent to express a judgment on the physiological view of the case, whether a greater quantity is really required.

4552. I wanted to ascertain whether the poor man economises his salt?—No doubt he economises in every way most carefully.

4553. Mr. B. Denison.] Will you tell the Committee where the customs line leaves the Indus?—It starts from the Sutlej. On the Indus we have a small line which goes up along the left bank of the Indus, merely to prevent the trans-Indus salt being brought in; but we have another preventive line along the north bank, the right bank of the Sutlej, which was fixed in our early rule with a view to prevent the salt of the Rajpootana States coming into the Punjab across our line. The line on which we levy duty commences at Fazilki, on the Sutlej, and goes down to Delhi, and beyond it; it runs north and south nearly; it is to intercept the salt that is made on the westward being carried to the eastward. And from the same point opposite to Fazilki, on the right bank of the Sutlej, we have established this preventive line to prevent the salt of Rajpootana coming across the Sutlej; so that it is obliged to cross the line where we levy duty. On the Sutlej line there is no duty levied; it is purely a preventive line as regards salt.

4554. What is the particular object of preventing the Punjab salt from going east, or the Sanbhur salt from going into the Punjab, the duty being not quite the same, but nearly the same?—In the early days of the Punjab, all salt from the south was prohibited being brought in across the Sutlej. It was never prohibited in the Sutlej States, but it was never allowed to be conveyed across the Sutlej west of Fazilki; because if salt had been allowed to be introduced across the Sutlej there, it would not have paid any duty to the British Government at all. Besides this, all salts, except the rock salt, were declared contraband north of the Sutlej, and our preventive line probably would not have been effective there if it had not been declared contraband.

4555. Would the preventive line have been less effective to the south of the Cis-Sutlej States than it was in any other portion of the North Western Provinces; I mean the line as it runs from the Sutlej right away south?—That is not strictly a preventive line, it is a line for realising duty; the only strictly preventive line is the one that we have in the Punjab to the north of the Sutlej to keep that salt out. We levy no duty on salt on that line at all. The only duty is on the line that runs from north to south, from Fazilki to Central India.

4556. You are speaking then of a different line when you say that it was established to

prevent salt coming from the eastward into the Punjab?—Yes, from the southward, rather, I would call it; but it commences opposite the same point, Fazilki, as our object is to prevent salt to the west of Fazilki coming across the Sutlej and into the Punjab, because then it would have paid no duty to our Government at all. Rajpootana and Sanbhur, and those parts, are all to the west of the Fazilki and Delhi line, and if they came north across the Sutlej into the Punjab, they would have evaded the duty.

4557. There is an unbroken cordon running from the Sutlej right away down to Central India?—Yes; on the one line it is freely allowed to cross, but it pays duty in passing.

4558. Since the duties have been raised in the Punjab, and also in the North Western Provinces, do the same reasons still prevail to make the retention of that line a state of necessity?—Certainly; because, until it has passed our line, it might come across the Sutlej into the Punjab without paying duty at all, if we had not such a preventive line. Our preventive line runs along the Sutlej, and prevents that salt coming across, otherwise it could come without paying duty.

4559. What is the salt consumed in the Cis-Sutlej States?—I should think the larger part was certainly the salt of Rajpootana that comes across the line; but I believe that also a very considerable portion of our rock salt is consumed there.

4560. This is a mere question of price, I suppose?—And of quality; the rock salt is preferred, and probably would be taken in many parts in preference, unless it very considerably exceeded the other in price.

4561. I was going to ask whether the comparatively smaller quantity of salt per head consumed in the Punjab, might not be in some degree owing to the superior quality of the salt?—I think very probably.

4562. You told the Chairman, I think, that there have been no particular chemical analysis of the saline qualities of the salt?—Not by the people, but we have frequently tested the rock salt, and it has proved to be excessively pure; some portions of it quite pure.

4563. The price of the salt in the market, and the cost of conveyance, are practically the conditions which determine the point at which the rock salt ceases to go eastward, I suppose?—I think so.

4564. You spoke of the Mundi salt in the native state of Mundi; that is a poor salt, is it not?—It is poor, inasmuch as it contains a large mechanical admixture of gravel and other things; but when that is taken out of the salt, I believe the salt itself is as pure as our rock salt; chemically, it is pure, but mechanically, it is impure.

4565. Does it find its way among our subjects in the plains?—Not largely, I think, in the plains.

4566. Do the native states, Cashmere and the others, levy an import duty upon the Punjab salt?—I think not.

4567. The expense of levying the duty at the mines is, I suppose, very trifling?—Very small indeed.

4568. Then this 71,000 £. which figures in the Parliamentary Returns as the charges of collection, I suppose is, really the expenditure on the preventive line?—Yes, on the preventive line on the Sutlej, and the preventive line in the salt range itself.

4569 Chairman.]

4569. *Chairman.*] And the cost of working?—Yes. That heretofore, we have borne; now it has been arranged that the wholesale purchaser shall bear that.

4570. Was that anna a maund put on with reference to that?—Yes, I suppose so; I do not know what the amount is, but Mr. Hume mentions from 2s. 2½d. a ton, I think. But I see from the return that he gives, that the cost of producing the salt of the salt range is considerably less than that of realising the duty upon the southern line.

4571. It is more than 50 per cent. less; I find here from the return for the North West Provinces, that the expense is 15 per cent., and in the Punjab, it is 7 per cent. only?—Yes.

4572. You have said, that the consumption of the rock salt is steadily on the increase in the Punjab?—Yes.

4573. I find also that the consumption of the Kohat salt is also on the increase; is that owing to a larger exportation towards Cabul?—No doubt, if it is increased, that must be so; there has been a moderate increase from 368,000 maunds at first, or less than that to 496,000 maunds in the last year, and the quantity sold last year is very little more than what was sold in 1864–65; it is only the difference between 437,000 and 496,000.

4574. *Mr. Grant Duff.*] You said that the tax was by no means oppressive in the Punjab?—I think it is not.

4575. Do you think that, as has been thought with regard to Bengal, you might even, if the exigencies of the State required, increase it?—Yes. I stated, as Lieutenant Governor, that I should be prepared to increase it if necessary.

4576. To what extent?—I just now stated, that I think practically we have reached the limit, viewing the circumstances of all India; but I should say, that 4 rupees a maund might be levied without creating an outcry. The people, whatever the reason may be, are certainly not disposed to make objection to the salt tax.

4577. *Mr. B. Denison.*] With reference to the consumption per head, the people of the Punjab, as compared with other provinces, consume a very large quantity of pepper, both in the dry state and in the other state?—I should say not, as compared with the south of India. I do not think that hot condiments are so much in use in the Punjab as in the north-west, even.

4578. At all events, perhaps it would be amongst the higher and better classes, if at all?—Yes.

4579. Do you think that their addiction to opium has anything to do with the consumption of salt?—No; it is but a small proportion of the Punjab population that consumes opium; the Mahometans do not consume it. The great bulk of our population are not Sikhs, who are the chief opium consumers.

4580. Up to the present moment, the only portion of the railway itself existing which could have any influence at all upon the price for the conveyance of salt in the Punjab would be the intervening bit between Lahore and Amritsar, I suppose?—Yes; a distance of 32 miles.

4581. *Sir C. Wingfield.*] You know the Mundi salt, in the Hills?—Yes.

4582. Have not the Government recently put a duty on that salt, in order to keep up the price 0.59.

of the rock salt?—I understand that there is a project on hand with that view; but it had not taken place in my time, and I do not think it has yet been carried out. It is mentioned by Mr. Hume as contemplated, but has not yet been carried out, as far as I know.

4583. I understand from Mr. Forsyth, who has just returned from India, that it has been carried out, and that the people of Kangra have made great complaints, because they were very dependent on this salt, as the rock salt, before it reached them, rose to a very high price; that is so, is it not?—Yes; the carriage there is chiefly on men's heads.

4584. Would not that appear an oppressive act, putting the duty on Mundi salt?—Any increase of that kind amongst those simple populations would create a certain amount of sensation no doubt, and be regarded by them as oppressive; but I do not think that, after all, they would be worse off than the rest of the people in the Punjab, unless a very heavy duty were levied. I do not know what the rate may be.

4585. I think it is a rupee; would that be oppressive in your opinion?—No, I should think not.

4586. Mundi is a native state; how could the British Government levy a tax on the produce of a native state; it would be in the nature of a transit duty, I suppose?—Yes.

4587. They could not tax it at the mines?—No; we have no possession of them. We could do almost as we like with Mundi; it is only *quasi* independent; even now we exercise a very great control, and could do that if we liked; but I have no doubt that whatever may be done, will either be done by an arrangement entered into with the native state to receive a sum from them, or by a transit duty, or a duty line on their frontier; but I have not heard the details of what is intended.

4588. *Mr. Carr.*] Is there any trade in salt across the northern frontier?—Yes, into Caboul, decidedly; that Kohat salt is largely carried there.

4589. Is there any export duty on that?—No; we levy a small duty at the mine, nothing more. I believe that the Caboul Government levy something as it passes their frontier.

4590. *Sir D. Wedderburn.*] I understand you to say that the rock salt is almost pure chloride of sodium?—Very nearly pure.

4591. Can you tell me what the impurities are that are found in the other kind of salt?—I myself have not been brought much in contact with them, but I think it probable there may be a great deal of the sulphate. It is very largely mixed with all soil-made salt of the Punjab.

4592. But there is not any actually unwholesome substance?—No. Glauber salt (the sulphate) may exist in it in small quantities, but not to any great extent.

4593. *Sir H. Lawson.*] Do you happen to know what the average price of salt is throughout India?—I think I mentioned that, as regards the northern part, including the Punjab and Oude, Mr. Hume, the Commissioner, estimates it at from about ½d. to 3d. per lb. the retail price according to locality.

4594. I suppose that is about ten times the price of what salt would be in England?—I do not know.

4595. Do you know that, on the sea coast where it is cheaper, the people, as a rule, use a great

Sir

12 May
1871.

great deal more salt than they do in the interior? —So I have understood. I have not myself direct cognisance of the matter; we have no sea-board in the Punjaub; but certainly in the southern portion, and all along the coast of Bengal, I believe they do consume more.

4596. Mr. B. Denison.] With regard to the line on the Indus, is that a preventive line, or is it for guarding the ferries?—It is a regular preventive line. Wherever we have a preventive line, it is never managed by guarding the ferries, but always by forming a road at a small distance, a few miles from the river, and stationing posts along it; but we have no line along the whole length of the Indus; it goes a very limited distance up.

4597. It goes northward as far as Attock?—There is an interval of about 40 or 50 miles which is left vacant; it goes from the Sutlej up to near Dera Ismael Khan, and then it is taken up again after an interval of 40 or 50 miles, and is carried on not only to Attock, but into the Huzara country.

4598. What route would the Kohat salt, the trans-Indus salt, take to go into Cashmere?—It would go up through Huzara to the north of Alhotabad, which is our civil and military station, and probably on from thence by the line of the Jhelum river into Caboul.

4599. But it is not allowed to come across the Indus?—Not properly.

4600. Then it is really smuggling salt through our own territory?—Yes, so far as it exists; but I am sceptical of its existing to any extent; it certainly has never been proved, and there is a wonderful absence of anything like seizures.

4601. Chairman.] What arrangements have they for bringing the salt of the North West Provinces into the Punjaub?—The only salt from below that has been admitted north of the Sutlej, I believe, is the Sambhur salt, and that is admitted in very small quantities, because some of our officials who belonged to the North West Provinces have from habit preferred that salt, and requested that it might be allowed to be introduced, and permission was given; but it has no inclination of itself to penetrate the Punjaub. The rock salt is uniformly preferred by the people of the Punjaub itself.

4602. It is more convenient to bring it direct to the Punjaub from the Sambhur Lake than to bring it round from the North West Provinces?—It must cross our line first and pay duty, and then it can come northwards or any way they like. There are some small native states it might cross, but the bulk of the route would be through our own territory.

4603. Do you keep any officers at the salt-works to watch the export of salt into the Punjaub?—We have now arranged with the Jeypore Jaudpore chiefs to take over the management of the Sambhur Lake; but in the other localities they are quite beyond our control; we have no access to them even.

4604. Have you stated what has been the increase of the revenue in salt in the Punjaub; have you got it 10 years ago, for instance?—I have it: taking any one year, it is very difficult to give it with any certainty, because it fluctuates a great deal. In the year in which we annexed the Punjaub, which was 1849-50, there were only 338,000 maunds from the salt mines that paid duty. In the year immediately after that, 769,000 maunds paid duty; in the following year

641,000; in 1852-53, 842,000. Then after that it continued gradually to increase, and the last year of which I have any record, 1869-70, 1,497,000 maunds paid duty, an increase of certainly 60 or 70 per cent.; that refers only to rock salt. In 1857-58, after the Mutiny, the line upon which duty is levied from the Sutlej to Muttra, was brought under the Punjaub, and that gave us a large accession of duty. In the year 1858-59, 12 lacs of maunds paid duty.

4605. I think you have given us the quantities already; will you now give us the revenue?—£80,000. we realised the first year from the mines, and 153,000 £. in the second year.

4606. Has it steadily increased since then?—Yes, both in quantity and the amount of duty.

4607. Have you given the rates that prevailed since our acquisition of the Punjaub?—Yes; and last year we realised 378,000 £. from the rock salt.

4608. Is there any obstruction whatever to the trade in salt across the frontier of the North West Provinces from the Punjaub?—Not the least.

4609. Mr. Fawcett.] Supposing that you require a greater revenue from the Punjaub, that is to say, supposing the financial exigencies of India should be such that you required a large revenue, would you recommend an increase of the salt duty?—I think that it might be realised; but I think before expressing a decided opinion upon a point of that kind, I should like to consult the natives more than we do generally.

4610. If it were necessary to raise a greater revenue, is there any tax that you would prefer imposing or increasing rather than increase the salt duty?—Well, I know of none that is less likely to create any sensation among the people; but there are many others that they themselves in native states raise; a tax upon marriage is one of their most favourite ones, and a poll-tax upon classes who do not pay land revenue, which they used to realise. They had a great number of irregular imposts under native rule, many of which we, perhaps, do not approve, but which they themselves prefer, I think. I would be very cautious about expressing a definitive opinion about any tax until I had had an opportunity of discussing with natives regarding it.

4611. You think that it would be unwise generally to propose any new tax, or to increase any existing tax, until the natives have been more fully consulted?—I think myself it is most desirable, before anything is done, for we really do not know what would be the result unless we did consult them.

4612. Chairman.] There is another item among the revenues of the Punjaub, namely, the "Excise on spirits and drugs;" will you explain to the Committee under what conditions that branch of revenue is collected, and from what objects?—In all the earlier period of our rule the excise upon spirits was levied entirely by the contract system, which has been described as prevailing in Bombay. The monopoly of sale was let out by auction to those who offered for it.

4613. By districts, or at each separate place?—Generally by districts; but within the last five or six years the Sudder distillery system has entirely superseded the other. A still-head duty is levied upon all spirits produced.

4614. Can you state the rate at which that duty is now levied?—I have taken no memorandum regarding that, as I did not know that I should

should be asked the question; but I think it was about a rupee 8 annas the gallon upon medium strength. There were various rates upon different strengths. But, in addition to the still-head duty, a large portion of the revenue is realised also by licensing shops for sale.

4615. Are they licensed at the discretion of the magistrate?—Yes; they are under control, of course. There is great disinclination to allow an increase in the number of shops without very valid grounds.

4616. Is there a fixed rate for the licenses?—No; they are granted mainly by auction. Some care is taken that disreputable people are not allowed to have these shops. There is some discretion used, otherwise they are generally given by auction to the highest bidder.

4617. The magistrate first fixing place and the limits of the district?—In India it is done by the Revenue Department, by the collector.

4618. But does he fix the neighbourhood where the shop is to be?—Yes, practically. They have been fixed in previous times, no doubt, by the local authorities of the day, and they have been continued from year to year as the authorities thought desirable, with additions or alterations.

4619. Are the licenses sold annually?—As a rule. In some instances they have been given for a longer period.

4620. Are the places where the spirits are retailed poor places?—Very poor.

4621. For the most part are they sold in the open air?—I think they generally sell the liquor and consume it within walls, and sometimes they are apt to be very uproarious places if they are not looked after.

4622. To what circumstance do you attribute the smallness of the revenue under this head in the Punjab, as compared with other provinces such as Madras and Bombay?—The majority of the population of the Punjab are Mahomedans, and they are not allowed to drink, though they do drink; as a rule they are not at all a spirit-drinking population. The Sikhs are decidedly so, but they are a small portion only.

4623. Do you mean the whole of the Sikh population?—They all drink spirits.

4624. That is to say, it is not unlawful for them?—Not at all.

4625. But do they drink to any considerable extent?—Yes, I think decidedly. Some of the smaller chiefs felt it a great grievance when our system was introduced, that they were not allowed to have their own stills. They are very particular about their liquor; they said that they could not get it good from the ordinary stills. I have no doubt you will remember that fact; but I do not think that they are very much given to getting intoxicated. Some of them have utterly broken down under it, but as a nation they are not drunkards.

4626. Are they in the habit of frequenting these places merely for the purpose of drinking?—Yes.

4627. But we are to understand that this revenue is chiefly paid by the Sikhs, and that the Mahomedans, as a class, do not drink?—Chiefly by the working classes, and more largely, perhaps, by people whom we have introduced into that part from other parts, than any others; the navvies upon the railways, for instance, and workmen generally of the lower classes and castes. In every village you have a number of
0.59.

these people, and they are the largest consumers by far.

4628. From what part have they been imported?—For our canals they have been imported from the Hissar and Delhi districts considerably, and for railways from all parts of the Provinces. Many of our servants, horse-keepers and others, are imported from Hindostan from the North Western Provinces, and all these are very much given to drinking, much more so, I think, than any class of Punjab proper.

4629. Can you state what the revenue was from the commencement?—No; but in the last administration report of the Punjab it is stated that the introduction of the Sudder distillery system has had the effect of very much reducing the consumption and increasing the revenue, and I have no doubt that it is a most beneficial change. The former system was a most injurious one.

4630. It did not work well?—No; it was rapidly promoting drunkenness. My early career was in the Nerbudder territories, where they have a wild hill people called the Gonds who drink largely, and I have known whole pergunnas depopulated in consequence of the action of our spirit contractors. They used to send people all over the country to seduce these poor simple folk, and utterly demoralise them. They got on their backs, and, after being sold out of house and home, they absconded in thousands.

4631. The man who did all this was stimulated to doing it by the Government?—Under that system he had the opportunity. It was not intentionally done by the Government, but that was the effect, especially when they got a large contractor. In some parts it was thought more advisable to have a large man, because he would have a greater stake to lose, and large tracts were given over in this way; but the result of that was so very injurious that the Government thought it necessary to put a stop to it, and in some parts the people were allowed to erect individual stills in these hill districts where they are very much given to spirits. But the system now prevailing in the Punjab has been, I think, very satisfactory in its results.

4632. Is there any revenue derived from drugs?—Yes, the monopoly of the sale of drugs is let out.

4633. What do you mean by drugs; what commodities?—The chief drug there is a preparation from the hemp that goes by various names, gúnjah, bhang, &c. The sale of opium is also let out in the same way and is included under drugs, but it is generally granted in a separate form and separately shown in our account.

4634. You have an item of "opium 1,375 l." in your accounts?—Yes, that is levied in two ways; in one part by an acreage on the growth of the poppy, but the great bulk of it is by lease of the monopoly of the sale.

4635. Those branches of the revenue are obtained by contract still?—Yes.

4636. For districts?—For districts: each district generally has its own contractor. But opium is produced of a very superior quality in one of the hill parts of the Punjab called Kooloo, and there is a duty levied upon it when it is exported from there to the other parts. That is quite a special case; any that is brought into the Punjab can only be sold by the privileged contractor after having paid the export duty.

4637. Do you know what the duty levied upon the opium manufactured in that district is?—I
E E could

could hardly trust my memory, but the returns will show the rate.

4638. Are the bhang and opium farms both put up to auction in the district?—Yes, generally separately; they used to be united, but now they are kept separate.

4639. Are they generally taken by the same persons?—Very frequently. In fact, I do not know any instance in which the opium has been contracted for by a different person from the drugs contractor.

4640. Sir W. Lawson.] I think you said that civilisation was increasing considerably among the natives?—Certainly.

4641. By that do you mean that there is more order among them than there was?—Much more of education spread amongst them, a much greater habit of thinking of matters of greater importance, and all that we generally regard in the light of civilisation. The higher orders are some of them receiving a very high education, and are taking a prominent position in public life.

4642. I had in my mind more the great bulk of the people, what would be called here the lower class?—Even amongst them we have established in the Punjab village schools to a very large extent, and in consequence there is much more of general intelligence being disseminated amongst the people than they possessed before.

4643. Is there a more equal diffusion of wealth among them, less abject poverty among the masses than there used to be?—In the Punjab wealth is increasing very much, and I think there is very little abject poverty of any kind.

4644. Are they better clothed and housed?—Yes; you can see in the look of the villages a decided improvement. And what is generally the criterion in India, to judge whether the ordinary population is improving in wealth, is by the quantity of ornaments that their females in particular wear, and they have very largely increased. Also the cooking pots that they have in their houses, which are almost the whole of their household property, are very much increased.

4645. Do you think that the average morality of the people has improved of late years?—I am afraid not; I do not know that they have been affected one way or the other, but I should not say that there has been any great improvement. Perhaps those who have received a high education from us have had more of self-respect than before, but I am not sure that they have been improved in all respects.

4646. How long have schools been established in the Punjab?—One school was established before we annexed the Punjab by missionaries on the Sutlej at Ludhiana which had a very considerable influence upon the Punjab. A number of youths, the sons of the gentry, were sent from Lahore to Ludhiana to be taught, and from that time we have from year to year increased the number of our schools, and the efforts and outlay on the part of Government; and after the first few years of our rule a cess was introduced of 1 per cent. for education alone from the proceeds of which village schools are now very largely sustained.

4647. Mr. J. B. Smith.] Has that assessment

been cheerfully paid by the natives?—Yes, perfectly so; practically it falls upon the Government in the end. In making the assessment of the villages, all cesses of that kind have to be taken into consideration more or less.

4648. But the establishment of schools has been popular?—Certainly; the agricultural classes, as a rule, do not care about knowledge as yet, but the mercantile and trading population take very largely to our schools.

4649. Mr. Fowler.] I understood that opium was extensively used by the population of the Punjab?—By the Sikh population. They form a very small portion of the Punjab, but they use it largely.

4650. And what is the effect upon them?—They sometimes become almost torpid for a time, and then seem to be cheered by it. I have seen some of the small Sikh chiefs who have been in the habit of using it, when debarred from it at the proper time, become almost imbecile and helpless till they get their quantity of opium, and then they get lively after a short time; and I do not think in the end it has produced any very injurious effects.

4651. Do they ever break themselves of the habit?—Not spontaneously. In the case of people confined in our gaols it has been a very difficult problem with the doctors how to deal with them; but in many cases they have managed, for a time at all events, to entirely put an end to their consumption of opium by using astringents and other processes; but I do not think that amongst themselves they ever spontaneously break themselves of the habit; they become quite wedded to it.

4652. In your opinion, then, the use of opium among the Sikh population is prejudicial?—I have never known any ill result, except that when they are deprived of it those who are inveterate opium smokers become helpless; but as a rule it has not produced any such injury, I think, as the consumption of hemp as a drug. That gets into the head, and often proves, I believe, very injurious.

4653. Does it shorten life?—I should think it does. I have never gone into the subject, but I have no doubt that the class that consume drugs largely are affected much more than people are by opium.

4654. You think that opium does not shorten life?—I am not aware that it does. Probably it does when carried on to a great extent. I have seen some very fine specimens of Sikhs who have been all their lives taking opium.

4655. Mr. Dickinson.] With regard to the Kooloo opium, where is that exported to?—Into the Punjab generally, and higher; it goes up into the Thibetan tracts, I believe.

4656. It does not go in any way to the sea coast?—I fancy hardly so far; but some of it is exported to places in the plains.

4657. Is there a high duty upon it?—No, much smaller than upon the opium that goes to China.

4658. Is there any tax at all upon snuff or tobacco?—No. A tobacco tax has been frequently recommended; but Mr. Strachey wrote an elaborate paper disapproving of it, and it was dropped.

MOUNTSTUART ELPHINSTONE GRANT DUFF, Esq., IN THE CHAIR

Mr. WIGRAM MONEY, called in; and Examined.

4659. *Chairman.*] Will you have the goodness to mention the appointments that you filled during your last 10 years in India?—I was Magistrate and Collector and Judge at Mirzapore, and Commissioner of Customs in the North West Provinces.

4660. You have given very special attention to the salt question in the North West Provinces, have you not?—Yes.

4661. Will you have the goodness shortly to describe to the Committee the method by which we raise our salt revenue in those provinces? The most productive salt sources are in the foreign territories, in Rajpootana and Bhurtpore. Formerly when these salts were brought into our territory, there used to be a duty collected all over the country at the different large stations, Cawnpore and Futtyghur; and in order to relieve the country from the vexations interference of traffic in going from one place to another, a customs line was formed outside on the borders of these foreign states, to intercept all the salt that would have been brought into our territory (*the Witness traced the line on the map*).

4662. What is the length of that line altogether?—1,800 miles.

4663. And for what purpose was it established?—To intercept the salt brought from the Rajpootana and Bhurtpore States, which supply the North West Provinces in a great measure.

4664. What articles pay duty on passing that line?—Only sugar and salt. Salt as it comes from the southward, and sugar as it goes out of our territories to the Rajpootana States.

4665. Can you tell us what number of persons are employed along that line?—There are 10,800 officers and men stationed along that line.

4666. Can you tell us what the annual cost of maintaining that line is?—It is 11 lacs and 50,000 odd rupees.

4667. Have you ever thought of any better means of collecting the revenue than that?—I do not think that there could be any other. As the salt comes from Rajpootana, except the line, there is no means of intercepting it. At present, I hear

the Government have taken possession of the Sambhar Lake, and made a treaty with the rajahs in order to give the merchants cheaper salt; but however much cheaper it is there, the Native states through which it must come to us will just raise it up to the same amount; therefore the people get it no cheaper at present, but when the railways are established from Sambhar to our territories it will escape the Native states, and then there will be a very great difference.

4668. Then, has a suggestion ever been made for arrangements with the Native states that might obviate the necessity for that line?—Not that I am aware of.

4669. But have any suggestions ever been made for other arrangements?—I do not believe that there have been with regard to the Native states; I can state the different amounts which the Native states, through which the salt passes, levy. When the salt leaves the Sambhar Lake, on entering the city of Jeypore the salt pays two annas a maund. On entering the Bhurtpore city, five annas and four pies; at the city of Tonk it pays two annas and six pies, at Boondée four annas and four pies, and at Suwace, Madapore, four annas four pies, as it passes those places; that is the amount levied from the merchants.

4670. Has there never been any suggestion for arrangements with the Native states for accommodating their duties to our wishes?—I never heard of it.

4671. Will you explain whence the taxed salt comes?—Chiefly from the Bhurtpore State, and also in our own country, from a place called Sultanpore and from Noh, a place 30 miles from Delhi, and also from Sambhar; those are the great places.

4672. Does any salt come into the North West Provinces, either from Bengal or the Punjab?—Yes; the Lahore salt comes from the Punjab. The Bengal salt very seldom comes up higher than Allahabad, it oscillates between Allahabad and Ghuzee pore.

4673. And which quality of salt is the best that comes into the North West Provinces?—

Mr.
W. Money.
—
16 May
1871.

What

Mr.
W. Money.
16 May
1871.

What the natives prefer is the Sambhur, which is consumed by all the wealthy men, the landholders and merchants.

4674. Why do they prefer it?—They seem to prefer the taste of it. The Europeans generally use the Lahore salt, the rock salt, and the reason, I imagine, that they use that is, that it is easier prepared and scraped off, and the other requires a great deal of washing.

4675. What is the amount of duty levied upon salt in the North West Provinces?—Three rupees.

4676. Have you ever heard that in any part of the North West Provinces, there is too little salt for the wants of the population?—I never heard such a thing.

4677. Have you ever heard complaints of the tax being oppressive in any way?—Never. I believe not one out of 100 men who pays the tax knows that he is subject to a salt tax, and I am quite sure that there is not one in 100 that ever buys salt directly. On purchasing his daily food he gets some salt, one or two chillies, and a few grains of pepper, ostensibly for nothing, and the price of the whole amount is included in the cost of the food.

4678. You lived a good deal amongst the people, did you not?—Yes.

4679. And you lived with them very familiarly?—Yes.

4680. Did you ever, on any one occasion hear any complaint of the salt tax?—Never a single one.

4681. I suppose they were in the habit of making complaints about many things?—They were quite ready to make them when they had any to make.

4682. But you never heard the salt tax mentioned as a grievance?—Never.

4683. Do you consider that if it were desirable, for the sake of the revenue, we could raise the salt tax at all?—I think it might be raised four annas more, to equalise it with the Beugal salt, without any difficulty.

4684. Would that have any other advantages?—Except raising the revenue, I do not know of any other.

4685. Nothing in the way of preventing smuggling?—No, I think not.

4686. You mean that there is not much smuggling over that frontier?—No.

4687. Sir C. Wingfield.] With regard to those places which you refer to, Sultanpoor and Noh, is the duty collected there at the works?—No, it is a transit duty collected on crossing the line.

4688. But they are in British territory?—Yes; but the line is between.

4689. Are there Government works at Sultanpoor?—Yes; they now belong to us.

4690. Why could not that duty be collected at the works?—Because the custom house is at Delhi, where the passes are sent out to them.

4691. But the Government have now got the lease of the Sambhur works, have they not?—Yes, I hear they have.

4692. They mean to collect the duty there on the spot, I presume?—Duty is not collected anywhere else but on crossing our line.

4693. It was absolutely necessary to have a line as long as the salt remained in foreign independent states; but if you have some in your own territory you may adopt another method, may you not?—You must have a line to intercept salt from Bhurtpoor and other parts of Rajpoo-

tana, although we have the Salt Lake in our possession.

4694. You say that you have never heard any complaints that the price of salt is too high?—Not from any natives.

4695. But the great majority of civil officers think it is too high, judging from my experience; is not that your experience also?—I do not think they do in the North West Provinces.

4696. Over and over again they have represented that the price is too high, have they not?—When I left Allahabad, the taxed salt was selling eight seers for the rupee. It is allowed that a man consumes four seers, or 8 lbs. a year; and that to a man receiving three rupees a month, or 36 rupees a year, would be just the 72nd part of his yearly income.

4697. Are you aware that calculations have been made showing that south of the line where the salt is free the consumption per head is very much larger than it is north of the line, where it has to pay duty?—Never.

4698. Did you see the Report of Mr. Hume, the Commissioner of Customs, on salt for 1869 or 1870?—I saw that.

4699. He adverts to all those circumstances; but he thinks that the extension of railways will cheapen the price of salt?—I will allow 8 lbs. for the consumption of a man. Perhaps you know that the sanitary commissioner in the Upper Provinces, when he was asked to state what was sufficient for the prisoners in his gaol, reported in 1868 that he found 100 grains a day, or 5 $\frac{1}{2}$ lbs. per annum sufficient to keep them in perfect health; and it is well known that prisoners require more generous diet than free labourers.

4700. But perhaps you are not aware that in a great many of the gaols of the country, the allowance of salt fixed by the inspector of prisons was found so totally inadequate, that it was increased by the local governments?—It was increased to 133 grains, and that in the year is very near 7 lbs., which is still under my allowance, for the poorest man who receives three rupees a month. The general wages now are either four or five rupees a month, two and a-half annas, or three annas a day; and I made a calculation that if a man receives an anna and a-half a day, he can get 8 lbs. a year.

4701. Mr. Beckett Denison.] The average of 8 lbs. is struck upon the whole population, men, women, and children, I suppose?—Yes.

4702. Sir C. Wingfield.] Are you aware that in the saliferous districts, where the salt can be made by scratching up the earth in front of a man's door, putting water to it, and then leaving it to evaporate in the sun, the practice of making salt in that way is carried on to a very great extent?—The trade in that kind of salt has now been entirely stopped; but for local consumption it goes on still, and it will go on for ever; and that is the reason why I maintain that the people have salt, although the quantity brought across our line, judging by statistics, does not equal the wants of the population. They get it from the saliferous tracts all over the country.

4703. But you are aware that that is an illicit manufacture, that they are liable to be punished, and that they were punished in great numbers for it till recently?—Yes.

4704. But would they run this risk of being punished, if it were not that the imported salt were too dear?—It makes no difference; if you reduce

reduce the duty to four annas a maund, they will go on making their salt.

4705. If there was no duty at all on the imported salt, you think that they would go on making it?—Yes, whatever may be the duty on the frontier, they would go on making that salt.

4706. Are you aware that the government of Oude, in the year 1859, prohibited all interference with what is called this rude domestic manufacture of salt?—Yes.

4707. And that afterwards, in consequence of the representations of the Commissioners of Customs in the North West Provinces, that the domestic manufacture was carried on to such an extent that it was injuring the salt revenue, the permission was taken away?—Yes.

4708. But the permission was granted because it was considered to be a very great hardship that the people should be compelled to pay a high price for the imported salt, whereas they could reduce that price very much by making this domestic manufacture, the rude salt out of the earth?—Yes, I remember that.

4709. Have you not heard it said that the high price of salt prevents its being given to the cattle, and consequently has led to a great deal of disease among the cattle?—I have heard it; but as a general rule, except when they are sick, I have never heard of cattle getting any. Where do the cattle in the jungles of Oude get their salt from? Except when they are sick they do not require salt.

4710. Everybody gives salt to his horses in India?—The cattle in the large droves in the forest do not get any salt, and yet they are in very good condition.

4711. You must have heard that for many years the civil officers expressed openly the greatest repugnance to enforcing the penal laws with regard to the manufacture of salt, thinking they were a hardship, and oppressive to the people?—I have heard that.

4712. Mr. Fawcett.] I understood you, taking your own estimate, that the salt duty represents for a man's consumption, 1-72nd part of the income of an ordinary labouring man?—Yes.

4713. That is, you may say, an income tax imposed on him of about $1\frac{1}{2}$ per cent.?—He pays no other tax, directly or indirectly, of any kind.

4714. Am I not correct in saying that that is about an income tax of $1\frac{1}{2}$ per cent. on that man?—Yes.

4715. His wife, I suppose, consumes about the same quantity of salt?—His wife I imagine does.

4716. And if he had three children, we will say under the age of 10, they would consume nearly as much?—Half the quantity I should say.

4717. Then, considering that his wife consumes as much, and that if he has three children they consume half as much, the average amount that he pays for salt duty, represents an income tax of nearly 5 per cent., does it not?—But they get their share too; they can pay for their salt as well; he does not pay for the salt of his wife and children, they all work.

4718. What age do the children work at?—At 10 and 12.

4719. But supposing that he has three children under 10, they do not work, and his wife if she has a great number cannot work?—Children work at eight and 10 years of age.

4720. Then I will put my case again; the children who earn wages, of course pay a certain

tax in proportion to their wages; I will assume that, but I will put this case, a man pays himself 1-72nd part of his income, his wife having a great number of children cannot earn anything, and he has three children under 10 years of age each of whom consumes, as you say, about a half of the quantity of salt that the man consumes; accordingly, a man in such a position has to contribute as nearly as possible 5 per cent. of his income to the salt duty?—I can only say that his wife and children also earn wages.

4721. But you say that the child is not employed until he is 10 or 12; it is quite a reasonable supposition that a man may have three children under 10 who do not earn wages?—Yes.

4722. I will take the case of a family where there is a wife and a considerable number of children, and three of the children happen to be under 10 years of age, and do not earn wages; in such a case, the man will be compelled to contribute, according to your own figures, to the salt duty 5 per cent. of his income?—If the wife and children do contribute to their food, he does not feed the whole family, they earn their wages, and some of them add their share towards it.

4723. I am afraid you do not understand my question; I asked you just now: at what age children generally go to work; you say when they are 10 or 12; it is not unreasonable to suppose that in a family there are three children under 10 who do not earn wages, and the wife, from having a large family, or from actually having children, is unable to contribute to the earnings of the family; a man in such a position, according to your own figures, must contribute nearly 5 per cent. of income to the salt duty; am I not correct in that supposition?—I do not accept the data.

4724. I have invented no data for you; in what respect are the data unfair?—You assume that the man feeds his wife and children from his wages; a child of six or seven in India is employed in the field in various ways; from the time when they are only six or seven children commence working.

4725. But you will remember that I took your own data; I asked you just now at what time the children go to work, and you said 10 or 12; you wish to say now that you were in error, and that a child goes to work at six?—At six or seven.

4726. You are quite certain that those are the data which you now wish to keep to, that a child does go to work at six or seven, not younger?—No.

4727. Then I will take this case, suppose a man has a wife and two children under seven who do not go to work, those two children consume, according to your statement, about half as much salt as the man; that being the case, he having also to keep his wife, who from having many children cannot work, the amount he contributes to the salt duty represents an income tax of 4 per cent.?—It may be so.

4728. But I venture to submit that that is not an answer; I take your own figures, and I draw a certain conclusion; I am anxious to obtain from you whether there is anything incorrect in the figures that I present to you?—Not that I am aware of.

4729. Then if those figures are correct, is there anything incorrect in the conclusion that I have drawn from them?—No, I do not see anything.

Mr.
W. Money.
16 May
1871.

Mr.
W. Money.
16 May
1871.

4730. Then it would be more correct to say that, in certain cases, instead of a man contributing 1-72nd part of his income to the salt duty he contributes 4 per cent. to it?—Every man is not supposed to be saddled with a wife and two children as you represent.

4731. But I say in some cases it is so?—There may be some cases of that kind; but I am speaking of the general consumption.

4732. You said just now, did you not, that the expense of keeping up this salt line for collecting the duty was 110,000*l.*, or 11 lacs of rupees?—Yes.

4733. What is the amount of revenue which is raised from this line?—£. 1,431,000; it is not always the same, it varies; it is about 1,000,000*l.*

4734. What should you say was the average?—In 1867-68 it was 1,389,461*l.*, and in 1866-67 it was 1,431,000*l.*

4735. Therefore 110,000*l.* has been spent to get this revenue on the customs line?—Yes.

4736. You gave an estimate, did you not, of the number of people employed in watching this customs line?—Yes, 10,800 and odd.

4737. Does 110,000*l.* cover the whole expense of employing the 10,000 people?—The duty collected upon sugar pays for the whole of that, and the salt revenue is entirely gained without any expense, net.

4738. But it struck me that, considering the number of men employed, the expense put down at 110,000*l.* was extremely small; does the expense cover the whole charge for these 10,800 men?—The 11 lacs of rupees are for the whole establishment; the line does not cost as much as that; the cost of the line itself is seven lacs and 54,000 rupees.

4739. You rather advocate, I understand you, that the salt duty in the North-West should be raised, do you not?—I am not an advocate for it, but I say it could be raised without pressing hard upon the people.

4740. What should you say would be the selling price of salt, supposing that there was no duty in the North-West: it is almost spontaneously produced by nature, is it not?—In great part it is.

4741. What is its price now?—Produced at Bhurtpore; it was six annas and eight annas a maund, and in our territory at Sooltanpoor, and now it is produced at from three to four annas a maund.

4742. But I mean what is the price including the duty at which it is sold to the consumer?—It depends upon what part it comes from.

4743. What is the average should you say?—At Allahabad, where I was last, that is 250 miles from the frontier, the taxed salt sold as I mentioned at eight seers for the rupee.

4744. What is that a maund?—Five rupees a maund.

4745. Then could you give me any estimate as to the price at which salt that was sold at Allahabad at that price, having to pay the duty, would be sold, supposing that the finances of India could afford for it to pay no duty whatever?—I should think it would be sold for a rupee and a-half without the duty.

4746. Would it cost as much as that?—The salt from the foreign territory would, but not our own.

4747. Considering that there is salt near Allahabad, what would that cost?—The salt produced

in the neighbourhood would sell for four or five annas a maund.

4748. That is a quarter of a rupee?—Yes.

4749. So that the price of the salt to the consumer is increased twenty-fold, owing to the duty?—It is increased, certainly, very considerably.

4750. But I want to get to exact figures. There is no question that it is twenty-fold; therefore the salt duty represents a tax of 2,000 per cent. upon the value of the article, does it not?—Yes.

4751. In many parts of India it is no exaggeration to say, from instances described by a previous witness, that the salt is spontaneously produced by nature, and there is simply the trouble of collecting it?—Over a great part of India that is so.

4752. And there the salt is taxed, is it not?—They are not allowed to manufacture it.

4753. So that it is a correct description to say, that in some parts of India you levy a duty of as much as 2,000 per cent. on the value of an article, and in other parts of India you levy a high duty upon an article which is spontaneously supplied by nature, and which could be obtained at no cost at all if it were not for the duty?—Certainly.

4754. Mr. Care.] It is analogous to a poll-tax, is it not?—Yes.

4755. Mr. Dickinson.] Whose property is the salt-producing land; who is the owner of it?—The landholders.

4756. Then it is a prohibition upon the landholder to use that produce at all?—Certainly.

4757. Even on paying duty, he is prohibited from actually manufacturing at all?—Yes, he cannot manufacture at all.

4758. He cannot have the produce of his own land, even after paying duty?—That is so; but since I left India I hear that at a few places they are allowed to manufacture salt on paying the duty of three rupees.

4759. Is that salt for sale, or salt for home consumption?—Salt for sale; that is since I left India. Certain parts of India, in the Jaunpore district, they have been allowed to make salt on paying the duty of three rupees.

4760. But still there are parts of India where the owner of the land is not allowed to manufacture salt at all?—Yes.

4761. Under what head of revenue do the sugar duties come, taking the North West Provinces, for instance?—They come under customs.

4762. Taking the entry of 49,000*l.* for customs, that would not be salt but sugar?—Yes.

4763. Can you tell me at all how the cost of collection is divided between sugar and salt, because last year in the North West Provinces accounts, you will see a charge against salt and a charge against customs?—The cost of collection is all put under the head of salt.

4764. But I understood you just now to say, that the customs paid the cost of collection?—No; the salt and the sugar both raise this revenue for paying this establishment; it is not headed first "sugar" so much, and "salt" so much.

4765. I think I understood you to say just now, that when the railway is made from the Sambhur Lake to our own provinces, the Sambhur salt will come cheaper?—Yes.

4766. Will not a transit duty be levied along the line of railroad?—Not until it comes to our customs

customs line; then they will have to pay as usual. Now it is brought on camels and bullocks; of course it will be brought much cheaper by railway.

4767. The railway from the Sambhur Lake to our own territory will pass through Native states?—Yes, but it will not be stopped there.

4768. How are you to prevent their levying transit duty, the same as they do now?—I do not know the position of the railway myself; I have not seen how it runs; but I should not suppose that it would be detained to be searched.

4769. Mr. *J. B. Smith.*] What is the distance?—One hundred and eighty miles.

4770. Mr. *Dickinson.*] At present the Sambhur salt, going from the Sambhur Lake to our own territories, pays duty to every state it passes through?—Yes.

4771. Those are called transit duties?—Yes.

4772. Do you know whether the same salt remaining in the Native states for home consumption pays other than transit duties?—It pays duties for guarding the salt; when they stop at a village they levy duty in that way on the pretence of guarding it.

4773. I mean, supposing salt to be exported from the Sambhur Lake to one of these intermediate Native states, it has to pay transit duty before it gets into that state, but would it have then to pay a further duty there for home consumption?—No.

4774. Do you know whether any of the Native states levy a duty on the salt for their home consumption?—No, I do not know.

4775. Have you ever considered the question as regards the equalisation of duties through India as between the Native states and our own territory. The salt at present from the Sambhur Lake going to our territory pays a transit duty; some of the Native states, take Malwa, for instance passing opium through our territory, pay a customs duty. Would English goods passing from one part of our territory to another through Native states be liable to transit duty there?—It depends upon the Native states or rulers, and what they chose to do.

4776. Do you think it is fair on the Native states producing an article that we consume to make it pay on coming into our territory?—We do not make them pay, they bring it themselves; we do not force them to pay.

4777. Then there is a duty on an article coming from a Native state into our territory; take Malwa opium, for instance?—We raise a transit duty on all the salt crossing our line from the Native states.

4778. Do we object to the Native states raising a duty on English produce passing into the Native states?—Not that I know of.

4779. Do we object to the Native states levying an import duty on our piece-goods going into their territory?—I have never heard any objection made; I do not think there is any interference of that kind.

4780. The question of the transit duties in India is left entirely to the regulation of these individual states?—Exactly.

4781. There is nothing approaching to a Zollverein?—No.

4782. Mr. *Beach.*] The consumption of salt varies both according to the rate of duty and according to the prosperity of the people, does it not?—I do not think that the people take more

than a certain quantity whether they get it cheaper or dearer.

4783. You think that the people always take the same quantity, whatever circumstances they might happen to be in at the time; in a good year, for instance, they would take the same quantity as in a bad year?—I think so; it is different from sugar; a man may consume more sugar; but taking more salt than usual would be very distasteful.

4784. Would they not lessen their consumption in a particular year; would a family, for instance, not consume less in a particular year than they would in another year; if a man was well off he would consume a certain amount; would he not lessen his consumption if he were not so well off?—If he could not get it, I suppose he would; but a man would not get more salt than his usual amount because it was cheap.

4785. But would he take as much if he had not so much money to pay for it?—If he could not pay for it, I do not suppose he would get it.

4786. Supposing a certain amount is taken as the average of consumption, would he, if he were not in receipt, say, of such good wages, or if he had more in the family to provide for, take quite as much?—I never heard of an instance of any person getting less salt than he required.

4787. Mr. *McClure.*] What other purposes than food is salt used for?—In the Upper Provinces it is merely used for individual consumption.

4788. Mr. *Cross.*] Do I rightly understand you to say that, in your opinion, the amount of duty makes no difference whatever to the amount of salt consumed?—The present amount of duty does not affect the consumption.

4789. Neither for agricultural nor for family purposes?—I never heard of its being used for agricultural purposes in India.

4790. How high do you think the duty might go without interfering with the consumption?—Four annas more, so as to equalise it with Bengal.

4791. Did I rightly understand you to say, that there was no grumbling at the present rate of duty?—I never heard a word against that tax.

4792. Not even from those persons who were prevented from making their own salt lying at their own doors?—Those people do complain, certainly, who are not allowed to manufacture salt.

4793. But does that grumbling go on to any great extent?—Not that I am aware of.

4794. And you think that if the duty were less it would not at all increase the consumption?—I do not think it would.

4795. Sir *J. Elphinstone.*] Viewing this as an imperial question, what is your opinion with regard to equalising the duty upon salt over the whole of India?—I am not an advocate for lowering it to the same as Madras and Bombay, because I do not think it presses heavily, as the duty still stands in the North West Provinces.

4796. Then you would not be opposed to raising the duty on salt in the other provinces, so as to make it uniform?—I do not know how it affects the people there.

4797. With regard to a zemindar who has property which is saliferous, is he prevented from manufacturing salt, or do the Government make any arrangements with him?—He is prohibited, except in certain localities where, I understand

Mr.
W. Money.
16 May
1871.

Mr.
W. Money.
16 May
1871.

since I have left India, they have been permitted to manufacture salt on paying the three rupees duty.

4798. But was it not the case, that when we took over the province of Cuttack, there was an arrangement made with the chiefs or zemindars, or gentry of the country, who had been in the habit of manufacturing salt in Chilka?—I do not know anything about Bengal.

4799. I think I understood you to say that we have acquired the property of the Sambhur Lake?—I understand that Government has taken charge of it.

4800. And as soon as the railway is made, they will take the salt there and bring it into their own territories without paying any transit duties at all?—I do not know what arrangements will be made eventually.

4801. They will have to make arrangements with the Native states through which it passes?—I suppose so.

4802. In all probability they will be of a much more favourable nature than at present, I presume?—Yes.

4803. The country is very sandy, is it not?—Yes, altogether.

4804. And the salt is carried by bullocks?—And camels.

4805. And, therefore, at a very considerable cost?—A maund of salt as far as Agra, costs a rupee for the carriage.

4806. What is the prime cost at the lake?—Nine annas.

4807. Then a rupee and nine annas is the prime cost of the article at Agra?—Yes.

4808. Then the 72nd part of a man's income that was alluded to, I suppose embraced that prime cost?—It is the Bhurtpore salt I referred to; Sambhur salt is dearer.

4809. What is the prime cost of the other?—Six annas, and the carriage.

4810. So that in making a correct estimate of the amount paid by a family, you must deduct the prime cost of the article?—Yes.

4811. Which reduces it very much from what the honourable Member for Brighton seemed to elicit from your evidence before, he did not take into account the prime cost?—No; I selected Agra as being one of the dearest places, and I took also the wages of the very lowest possible kind, to show that if it did not press heavily upon a poor man, then it must be admitted that it did not press heavily upon anyone.

4812. In that view you have another charge to add; you have the prime cost, the carriage and the retail profit?—Yes.

4813. So that that deducts very considerably from the sum paid by the ryot; he must pay these three charges at any rate; he cannot avoid them?—Yes.

4814. And the consequence is that the difference between them and the sale price is what he actually pays to the State?—Yes.

4815. Which amounts on the average to about a rupee a head?—On my calculation it would not cost a man more than half a rupee.

4816. That is the only tax he pays?—Yes; the only one that he pays, either directly or indirectly.

4817. From your knowledge of the country, do you see your way to any other tax which you could possibly levy, which would reach that class of the population?—I am not aware of any.

4818. And in consideration of that tax, the

ryot has safety of life and property, and in fact the whole benefits of a civilised government?—Yes.

4819. Mr. J. B. Smith.] I understand you to say that you have resided in India for many years?—Yes.

4820. And that during that time you have mixed much with the native population, and therefore are well acquainted with their feelings, and that during all that time you have never heard any complaint of the salt tax?—Never one single word.

4821. But you are aware probably that there are petitions sent from India, from Bombay, for instance, complaining of it?—I never heard of it till I came to England.

4822. But you have heard of these complaints?—In England I have.

4823. From whom are those complaints?—I have not the slightest idea; agitators, I think.

4824. Then you naturally draw the inference, as you never heard any complaints, except in England, and never heard any from the natives, that they are satisfied with it?—Quite so.

4825. And that they think it a reasonable impost for the benefit they think they receive from the Government?—I do not believe that they ever think anything at all about it; it never seems to enter their heads.

4826. You have stated that a railway is about to be made from the Sambhur Lake to Agra; I think you say that the present cost and carriage is a rupee per maund?—About that.

4827. And how is it carried?—By camels and bullocks.

4828. What will be the cost of carrying a maund by the railway?—No doubt it will be much cheaper; I think it is two annas per maund a hundred miles; that is not quite four annas for 180 miles; that is less than one quarter.

4829. There would be a reduction of three-fourths in the cost of carriage?—Yes.

4830. That would enable the seller of salt to get the same profit from it by selling it at three-fourths of a rupee less?—Yes.

4831. And therefore the consumer of the salt would get all that benefit by the cheap conveyance?—Yes.

4832. Do you think that the opening out of the railways has had any effect upon the price of salt?—Already it has reduced the Bombay salt up to Nagpore very considerably.

4833. Do you know how much?—No, but it is beating the salt brought from Sambhur by taking its place. Where Sambhur salt used to be consumed they are now consuming this Bombay salt, in consequence of the facility of bringing it up.

4834. But was not salt very dear in the Central Provinces owing to the want of conveyance?—It was very dear formerly.

4835. That was the dearest point in India, was it not?—Yes.

4836. The opening of the Godavery River will reduce the price of salt very considerably, will it not?—No doubt.

4837. Mr. Lyttelton.] To what extent is the salt within the customs line manufactured?—It is entirely prohibited, or has been for years; but within the last year I am told that they have been permitted to make it in the district of Jaunpore, on payment of the tax of three rupees a maund.

4838. Do you know what the result of that experiment has been?—I believe it has been a failure,

failure, and it is going to be given up as far as I can hear.

4839. We may conclude that if the experiment was extended, the manufacture of salt could not be carried on to any great extent?—I cannot tell; I understand that this experiment has not answered.

4840. Can you see any reason why a system of private manufacture of salt, and raising a revenue by excise, should not be profitable to the Government?—For this reason; it would be impossible in the North West Provinces. The salt is scattered over thousands of square miles in small quantities. If it was situated in one spot where it might be guarded, and you could be sure that the duty was paid, you might have an excise as you have on the sea coast; but spread over so many thousand square miles you would require an army to watch it.

4841. *Mr. B. Denison.*] Before you left India, had the policy of equalising the salt duties, with a view to doing away with the necessity of this enormous preventive line, been under consideration?—No, it had not; but the salt from Rajpootana would have free access to our territory, if it were not for the preventive line.

4842. But now, as you are aware, arrangements have been made by which, in lieu of certain money considerations, the Government of India are to obtain complete possession of the manufacture of salt in the Sambhur Lake?—Yes.

4843. From your knowledge of the country, do you think it possible so to arrange the manufacture and sale of salt, as to levy an excise at the point of manufacture, and to do away with the customs line?—Certainly not, for this reason; if the duty was levied at Sambhur Lake, the country between Sambhur Lake and our line is covered over with salt works, and their salt would come into our territory, and supply the place of the other salt altogether.

4844. I do not know whether you have explained to the Committee the way in which the line works; the merchants, as a fact, come to the customs house, either at Delhi or at Agra beforehand and obtain passes for the salt, do they not?—Yes.

4845. Then, any salt passing the line which is not covered by a pass, is liable to confiscation of the article and the loss of the carriage?—Yes.

4846. Have you any returns by which the Committee can ascertain what is the effect of the preventive line; that is to say, what is the amount of property confiscated for smuggling, or the amount of fine inflicted for smuggling?—It is something very trifling now; it is never carried on to any large extent now; only in small quantities.

4847. You mean that penal measures have become almost unknown?—Smuggling has so diminished; it is in very small quantities.

4848. To what do you attribute that; to the greater efficiency of the line?—Certainly.

4849. As a matter of practice, and with a view to checking local manufacture, what do the Customs establishment do; do they leave their line and make visits all over the country north of the line?—No, they are never allowed to leave the line; merely to patrol up and down; they never leave the line on any consideration.

4850. You had a suspicion that an illicit manufacture of salt was going on, from whom would you get the information?—There is an establishment

carried on in the interior to look after the illicit manufacture, entirely separate from the line.

4851. Then you have reason to believe that the illicit manufacture of salt is confined within small proportions?—The illicit trade within the customs line is entirely stopped; but the illicit manufacture for private consumption, I imagine, goes on the same as it did.

4852. You mean that where the manufacture does take place, it is for the consumption of the person who makes it, not for the purpose of selling?—Just so.

4853. Were you a collector of customs at any time when there was a partial famine in the North West Provinces?—No.

4854. My object was to ask you, whether in years of great scarcity and famine, the consumption of salt was visibly and materially decreased or not?—I understood that this last year there have been a famine in Rajpootana, and there is a great decrease in the salt trade on account of the bullocks and other animals that convey it having died.

4855. But upon your knowledge of the habits of the people of India, you would say, would you not, that salt being one of the necessities of life, would be one of the last things that they would discontinue the use of?—Certainly.

4856. Have you ever made any calculation as to what proportion the consumption of salt bears to the cost of life per head in India. Taking the cost of salt at so many pounds for an individual; and at what you have told us is the selling price in the North West Provinces, about eight pence to the rupee, have you ever made a calculation as to what proportion that cost would bear to the expenditure on food generally?—No, I have never made such a calculation.

4857. But it is something very small, is it not?—Very small, I should say. In Madras, and Bombay and Bengal, the consumption is said to be much greater per head along the sea coast; the consumption per head there, must include the expenditure of salt for salting fish; and in the North Western Provinces, the term is used literally, means the salt actually eaten by each individual.

4858. But with reference to the questions that were put to you by the honorable Member for Brighton, I understand you that the cost per annum per head of salt is really so small that it is a matter of imperceptible amount, whether the duty is a thousand per cent. on the produce price, or whether it is two thousand?—Yes; the poorest person does not feel it.

4859. Much in the same way, as it does not much matter to the consumer whether a glass of beer is charged a halfpenny or a penny?—Yes; as I mentioned, not one in a hundred of the people knows that he is subject to the salt-tax.

4860. Have you any information to give to the Committee about saltpetre?—The trade in saltpetre has fallen off considerably in the last six years owing to the improved method of preparing the artificial nitre. I reported for several years that the trade was falling off; ever since Mr. Wilson put on two rupees duty on saltpetre the trade has been falling off; and since they discovered this new method of making the artificial nitre in Europe, the trade has almost disappeared from India.

4861. But there were strong remonstrances made from Calcutta, and other ports of the empire, against raising the export duty on saltpetre, were

Mr.
W. Money.

1871.

Mr.
W. Money.
16 May
1871.

were there not?—Yes, and that has entirely ruined the trade.

4862. The duty I think was abandoned afterwards, but not in time to save the trade?—It was too late.

4863. With reference to these 10,800 servants of the Government employed in this preventive line, in days of turmoil and trouble have they ever been of any use to the Government?—During the Punjab campaign they escorted the guns and ammunition from Delhi up to Feroz-pore.

4864. But at a subsequent period were their services offered to the Government for police or military purposes?—During the mutiny there were some hundreds of them employed at Agra in that way.

4865. As a rule the men of the line are drawn from one particular part of India, are they not?—Not now.

4866. The average pay of one of these men is what, four rupees a month?—It has been raised since I left India, and I believe it is five rupees. The wages over India for all descriptions of people have been increased. The articles of food have become much dearer in the last 10 years.

4867. You are distinctly of opinion that no arrangements are practicable by which we could do away with the services of this long line of preventive officers?—It seems really impossible if you wish to raise any revenue from salt.

4868. Mr. Cave.] As to the duty on salt coming from the Native states into our own states, that is a customs duty I suppose?—A transit duty.

4869. Merely a transit duty?—Yes.

4870. Then where is the salt going?—Whether it is going from one part of the Native states to another, when it comes to our territory, they collect a transit duty from it.

4871. But if it comes to our own territory, then, I suppose, it remains there till it is consumed?—It does so.

4872. But when it comes to our territory, does it go beyond it to other states, or remain there?—It is consumed on our territory.

4873. Then when it comes from the last Native state to our territory, it ceases to be a transit duty, and in fact becomes a Customs duty?—Yes.

4874. Of the same amount as the excise duty levied in our territory, I suppose?—Yes.

4875. And if it is of the same amount, it is no hardship to the state from which it comes, I suppose?—No.

4876. You say that a native does not do without salt, but an Indian does without almost everything, does he not, when the price rises; is it not the habit of the Indian to cease to use almost every commodity when the price comes to a certain point, take sugar for instance?—I suppose he would leave off sugar.

4877. Is it not the fact, that when sugar reaches a certain price, it comes to this country from India to a great extent, instead of being consumed there?—Yes.

4878. If so, somebody there must leave off the use of it?—Perhaps they do; I do not know that.

4879. That has not come under your knowledge?—No.

4880. What I wanted to bring you to was this, that if that is their habit, you must tax something which is absolutely necessary; otherwise you get no tax at all?—Exactly so.

4881. Do you think that this salt duty interferes with salt being used for other purposes, either for salting fish, or for agricultural purposes?—It is only used for eating in the upper provinces; there are no fisheries, or anything of that kind.

4882. There is no way in which salt could be used except for domestic use?—No, except in the way of medicine, it is very seldom given to cattle in India, except horses.

4883. And you do not think that the tax interferes with that practice being enlarged?—No.

Sir ROBERT NORTH COLLIE HAMILTON, Bart., K.C.B., called in; and Examined.

Sir R. N. C.
Hamilton,
Bart., K.C.B.

4884. Chairman.] WILL you be good enough to mention what high offices you have held in India?—I was Commissioner at Agra, afterwards Secretary to Government, North West Provinces, and then Governor General's Agent in Central India, Central India then being all the provinces of Scindia, Holkar, and Rewah, &c.

4885. Were you not a long time at Indore?—Yes, I was resident at Indore, and afterwards became also agent for the Governor General in the Central Provinces; at that time Rewah, Scindia, Holkar, and many of the petty Rajpoot states were under my charge.

4886. And you have given very special attention to the Malwa opium, I think?—Yes; the Malwa opium all went from Indore.

4887. Would you be good enough to explain to the Committee how we raised our revenue from the Malwa opium when you were at Indore?—We had nothing to do with the cultivation; we made no advances; the opium that was intended for exportation was brought in chests about 112 lbs. each; they were brought to the scales at Indore, and paid the duty there; when I first went into Malwa the duty was 200 rupees a chest, but during the time I was there

it was raised at my suggestion up to 500, and the export continued.

4888. Now, where is this opium grown; is it entirely in the Holkar States?—No.

4889. Will you specify the district?—There is a great deal grown in Holkar's, and a great deal grown in Scindia's territory; there is a great deal grown in Rutlam; and more or less in every petty state they grow opium.

4890. And is all this opium brought to Indore?—All that was meant for exportation was.

4891. Then what officer levies the duty on the part of the British Government?—The scales were established at Indore, and in former days there was an opium agent; but since my time, at all events, there was never a separate opium agent. There was an establishment there to weigh the opium, and, having paid the duty, it was scaled and had a pass given "to cover" it to Bombay.

4892. Was it directly under the Governor General's agent in Central India?—Yes; the Government levied the 500 rupees, or whatever was the pass duty; and then it was sent from Indore to Bombay, to be delivered over to the opium agent in Bombay for exportation.

4893. I suppose the agent of the Governor General

General at Indore gave the exporter a pass, did he not?—Yes; there was a regular printed pass, which was filled up and signed by myself as the agent of the Governor General, and under that pass the opium went to Bombay.

4894. That cleared the opium all the way to Bombay?—Yes.

4895. Was the opium stopped and examined any where on the road?—It was liable to transit duty through Native states, but I made an arrangement with the Native states that they should collect the whole of the duty at one place, at the top of the ghât Mawnpore, and then divide it by a mileage, and whatever the amount of duty was at the end of the year, it was divided amongst the Native states which the opium passed through according to the mileage.

4896. Then from the time that the opium left Indore, had the exporters to show their pass once, or more than once?—On the part of the Government a man went with it in charge from Indore to Bombay; it could not be stopped anywhere, or opened anywhere, but it must be delivered to the opium agent at Bombay.

4897. The opium agent at Bombay, being an officer of the Customs?—Yes; the duty was paid at Indore, and the drug was delivered for exportation at the warehouse.

4898. I think you said that when you were first at Indore, the amount levied by us on the opium was only 200 rupees?—Yes.

4899. But it has since risen very much above that, has it not?—At first the profit did not go to the cultivator at all; the profit was all to the speculators, and after a great deal of correspondence, the Bombay Government assented to raise the price for the pass duty to 300 rupees, and then gradually it went up to 400, and at last it went up to 500 rupees. The original cost of a chest of opium was perhaps not more than 300 rupees, and its selling price in China was 1,200 rupees.

4900. But the duty has been considerably above 500 rupees, has it not?—Just as I left Indore, Lord Canning telegraphed to me to know whether the duty could not be raised to 600 rupees. I said that the duty could be raised to 600 rupees, provided the Bengal Government gave up the monopoly, and had an even duty all over the country; after I left it was raised to 600 and tried to 700, and then it broke down.

4901. But it was tried to 700?—Yes.

4902. And that was found not to answer?—It broke down.

4903. Then it was reduced to 600, and there it has remained ever since, has it not?—I believe it is 600 now.

4904. Is opium grown in large tracts, or here and there, scattered over the country?—The cultivators grow a certain quantity of other produce, grain, for their maintenance; opium is generally grown on advances made to them, which advances go to pay the revenue.

4905. Who make the advances?—Generally agents for Bombay merchants.

4906. Does Holkar, and do the other native princes in whose territory the opium is grown, reap any advantages from it in the shape of a duty?—They levy a duty, but not what they might, if we did not get 600 rupees.

4907. But what duty do they get?—I think Holkar gets eight or 10 rupees a chest.

4908. Do you believe that much of the opium grown in these Native states reaches the sea without passes from us?—No.

0.59.

4909. You do not think that there is any great amount of smuggling?—No, not much.

4910. Have you ever heard of smuggling from Damaun on a large scale?—Yes, but that comes from further in, Rajpootana.

4911. Where is the opium that reaches the sea at Damaun grown?—The opium that came down to Damaun, comes from north west of Malwa; I think they established scales somewhere at a separate place, which diverted the opium and allowed two channels to Bombay. As long as there was one channel it could be guarded, but now that it is going round by another channel, I dare say a great deal of smuggling will take place.

4912. You, I think, have always been an advocate of an export duty as against the monopoly?—Yes, I have always advocated an export duty, and I have always advocated the abolition of the monopoly. The proposal which I made to Government was, that the Government should gradually reduce their cultivation and settle the number of chests that should go to Bombay every year, and that Malwa should supply the deficiency. Malwa cannot compete with the Government monopoly.

4913. I think there was a considerable discussion of that question raised by a paper of yours, was there not, in the year 1869, which discussion is contained in papers before the Committee now?—Yes; the cost of a chest of opium to our Government from Malwa in 1862–63, was one and a-half annas per cent., that is about three-pence. That is all the expense that the Government went to in receiving the 600 rupees.

4914. The Malwa opium is thought the best, is it not, for the China market?—The juice of the Malwa opium is considered to be the best, but when I was there we had some experiments made. Dr. Murray, who was my surgeon, and I got some opium direct from the poppy-head and made it quite pure, and that was sent to Bombay to be tested by the Chinese. Their answer was, "This opium is too strong; it is too hot." That opium is medicated and prepared for the market, and in China it is mixed a great deal with the Bengal, and makes a saleable opium.

4915. Then the Malwa opium, as at present prepared, is not quite pure, is it?—The pure opium is too strong for them to use.

4916. But is the Malwa opium adulterated with any foreign substance at all?—It is adulterated; it is prepared for the market.

4917. What is it adulterated with?—I could hardly say; with oil and catchu. I do not know what the process of preparing it for the market is, but if it is not made to their taste they will not buy it. A few years ago they adulterated it so much to increase the quantity that they lost the sale.

4918. Is the Bengal opium, as prepared by us at Patna, absolutely the pure juice of the poppy?—It is pure, I should say; but then before it is used it must be adulterated, you may call it. It is medicated, and prepared for the palate.

4919. Before it is used in China, you mean?—Yes.

4920. What do you suppose is the cost of production of a chest of 112 lbs. of opium?—About 300 rupees; 250 perhaps, or from that to 300.

4921. Supposing that we were to lower considerably the duty on Malwa opium, do you think that we should gain a larger revenue by it?—Not if you supply the market from Bengal.

4922. Supposing we adopted your plan, I mean

Sir R. N. C. Hamilton,
Bart., K.C.B.

1871.

Sir R. N. C.
Hamilton,
Bart., &c. &c.

16 May
1871.

mean?—I think Malwa would in time produce enough for the China market; it is a very uncertain trade.

4923. And that we should obtain a larger revenue than we do now from opium in all India?—If you gave the China trade entirely up to Malwa, I think Central India would be able to supply it.

4924. Do you think that if we gave up the present Bengal system, and trusted to Malwa alone, we should on the whole receive a larger amount of revenue on account of opium from India; do you think our net receipts would be larger in the year?—Opium takes two or three years before it becomes ready; therefore my proposal to the Government was, that, taking 40,000 or 50,000 chests as the maximum supply which they would send to China, if they reduced the quantity, and announced that they only intended to send 45,000 the next year, or 40,000 the year following, then in that way Malwa would grow opium to supply the deficit; but Malwa could not produce 45,000 chests more in one year.

4925. Do you believe that when your plan was fully carried into effect we should be gainers rather than losers in respect of the revenue?—We should not cultivate it at all then.

4926. I ask whether the Government of India, if it adopted your plan, would receive as large or a larger amount, or a smaller amount, from opium from the whole of India; or whether you advocate the plan independently of financial considerations?—Let me answer that in this way; if you sent 48,000 chests from India, which cost you only one and a-half annas per cent., you would save in the advances you make, and the cost of your own productions a very large sum; and I think that the Malwa opium then would bear a higher rate of duty, 700 or 800 rupees a chest, which would recoup the Government in their revenue.

4927. Then you would answer the question in the affirmative?—Yes, that is giving time for it to be produced.

4928. When your plan was developed, that would be the result, you think?—Yes.

4929. Mr. J. B. Smith.] How many years would that take?—I do not suppose that the Government would cease the cultivation under five or six years.

4930. [Chairman.] Did you advocate that kind of arrangement mainly from financial considerations, or because you thought that the Government was exposed in this country to a certain amount of blame on account of the Bengal system?—I looked upon it in both ways; that Government would not be so great losers, and certainly they would save themselves the odium of being the producers of the poppy.

4931. You say "not so great losers," you admit that they would be losers?—The trade is such a risk.

4932. In short, you would not guarantee that the Indian Government would be as well off one year with another, if it followed the plan which you suggested, as it is now?—If China did not prohibit it altogether.

4933. But putting that consideration out of the question, you would not guarantee that under your new system the Indian Government would, one year with another, receive as much net revenue from opium as now?—No.

4934. Mr. Cave.] Is opium a precarious crop?—Yes; one hailstorm will spoil a whole year's cultivation.

4935. Then, of course, it is dangerous to rely upon it for so much revenue?—Yes.

4936. Does Persia make more opium now than it used to do?—I cannot speak for what has happened since I left, but inquiries that I made have lead me to suppose, that in fact the Turkey opium did not sell in the China market; it was not liked; and the Persian opium had not then found its way there in any quantity at all.

4937. It is said, is it not, that Persia opium is equal to the Malwa?—I have no knowledge of that.

4938. I think you have stated that the Malwa opium can get to a port without going through British territory?—The pass duty is paid in the Native state.

4939. But supposing it to get to a port without going through British territory, how could you oblige it to pay duty at all?—If opium came into British territory, it would be confiscated.

4940. But supposing it goes to a port without going through British territory, what hold have you upon it at all?—If it can be shipped without being known, it can be smuggled.

4941. Is there any port to which it can go without going through British territory?—No, the seaboard is all English.

4942. Of course it could not get to Pondicherry, for instance?—It would have to go through English territory to get to Pondicherry.

4943. And therefore it is impossible that it can get to a port, unless it is smuggled, without paying this duty?—Yes.

4944. The Malwa opium is much more valuable than the Bengal, is it not?—It is a better quality.

4945. And your proposal is to make the Bengal system the same as the Malwa, is it not?—Yes, for the Government to give up the cultivation.

4946. To give up the cultivation and manufacture, and leave it to be done by other people?—Yes, and to levy the same rate of duty.

4947. But if the same rate of duty were levied upon the two, it would throw the Bengal opium out of cultivation, would it not, if it is so much inferior to the Malwa?—No, I do not think it would throw it out of cultivation.

4948. At any rate the Bengal producer would not get the same profit as the Malwa producer does?—It would not sell for such a good price in China.

4949. Does the Bengal opium sell for as much as the Malwa?—I think pretty nearly; it is sold in Calcutta.

4950. I suppose it is eventually sold in China?—Yes, I would not speak with certainty, but I think that the Bombay opium is not very much below the Malwa in price in China.

4951. You think there is not much difference in China between the two, though the Bengal is said to be inferior in quality?—They mix the two.

4952. You think that the price in China, after the system had been altered in Bengal, would be quite sufficient to keep up the cultivation at its present rate?—Supposing the demand continued.

4953. That is supposing the demand was what it is now?—Yes.

4954. You do not think that the Malwa would drive the Bengal out of the field, but rather that one would help the other?—Yes.

4955. Sir C. Wingfield.] Is not the opium that is grown in Malwa, grown under advances supplied by Bombay merchants?—Advances are made by an agency from Bombay, I suppose.

4956. I suppose

4956. I suppose an agency on the part of the Bombay merchants?—Yes.

4957. The opium that is grown in Malwa then is all grown under advances?—Yes.

4958. Therefore the production can hardly be said to be perfectly spontaneous on the part of the people; if these advances were not made the opium probably would not be grown?—It is an advantage to the people to grow opium.

4959. But what I mean is, that unless these advances were made, the cultivators would not grow the opium?—That is so; it requires a large establishment, you know, to prepare the opium; they grow small quantities of opium which are collected by different people, and then in the bulk it is sold to the agents.

4960. Therefore their system differs from the system in Bengal, namely in this, does it not, that in Bengal the advances are made by the Government, and in Malwa they are made by private capitalists?—I fancy the Malwa advances are made with reference to the market; the Bengal Government make them with reference to the prospects of revenue.

4961. Still, in either case, advances are made, though by different parties?—Yes.

4962. Then, is it not the case that the cultivation in Malwa is superintended and supervised by the servants of the Native government?—No.

4963. Is not the ground measured, and a register made of the people who cultivate opium, by the Native government?—No, not by the Native government.

4964. The Native functionaries are not employed, then, in supervising the cultivation of opium?—No.

4965. Must not all the opium from Malwa that leaves Malwa for the coast pass through narrow passes, ghâts, where it can easily be watched if necessary?—The opium that is grown in Malwa, that is intended for exportation to China, is made into balls and put into chests, and brought to the scales. There may be smuggling; I do not know about that.

4966. But what I mean is, that you can easily watch all the opium that is grown in Malwa on its passage to Bombay; that is to say, it is not an open country; it must pass through particular roads in a mountainous country; and, on the other hand, the seacoast is accessible from most parts of Bengal; therefore, Bengal opium could reach the sea by rivers, roads, and a variety of ways; so that it would not be so easy to prevent the smuggling of opium from Bengal as it would be from Malwa?—The smuggling would be by the exporter; the cultivator would not smuggle it.

4967. Opium cannot get away from Malwa very well except by one or two passes; whereas it can get away from the interior of Bengal by numerous different routes to the sea, cannot it?—It would require more watching in Bengal, no doubt.

4968. Sir D. Wedderburn.] I find that there has been a steady increase in the rate of pass fees during the last 30 years, rising from 125 rupees a chest to 600 and 700 in the year 1862-63; the revenue then culminated, and has since rather diminished: now, may we infer from that, that we have reached the highest limit of taxation or duty at 700 rupees a chest?—Certainly.

4969. In 1862-63, a revenue of 3,242,500 / 0.59.

was collected for a cost of 3,437 /, something like one-tenth per cent., the whole of the opium on which it was collected being grown and consumed on foreign territory; now, does not that seem a very precarious method of raising a very large revenue, and one altogether unprecedented in the history of any country?—The British Government have nothing to do with the cultivating of it.

4970. But I ask you, with regard to the precarious nature of the revenue; we have a revenue collected from a commodity grown in foreign territory, over the growth of which we have no control, and consumed in foreign territory, and over the consumption of which we have no control; now does it not seem likely that we might suddenly find ourselves short, very greatly, in that particular department?—We shall be short any day that China refuses to receive it.

4971. Or, in consequence of any regulation made by the native princes in Central India?—No; the native princes benefit by it, only they do not benefit so much as they would do, if you did not put 600 rupees duty on it; they do not get the proportion that we do.

4972. What margin of profit do you suppose remains for the native princes after what we have taken, which amounts to about an *ad valorem* duty of 50 per cent.?—When those 48,000 or 49,000 chests went through the scales, I think the Holkar estate got 48,000 rupees, they would get about 10 per cent. on it.

4973. I will take one year as an extreme case; in 1862-63, we netted a revenue of more than three millions, namely, 3,242,000 /; I should like to know if there is any means of estimating what amount the native princes profited in such a year as that?—They profited 10 per cent. on the whole.

4974. They took 10 per cent. of what we got?—Yes.

4975. Is there any large extent of territory in Malwa fitted for the growth of opium, which is not now under opium?—Yes, certainly.

4976. The cultivation could be extended indefinitely, if the demand were greater?—Yes; but it takes three years to get the ground into a state to grow new opium. It requires manuring and high cultivation.

4977. The climate of Malwa and that of Bengal are different, and in some years you have good crops in one country and not in the other, so that it would be expedient to have two sources to depend upon; it would be a great risk if we only had one of those countries to draw our opium from, would it not?—Yes.

4978. Malwa is very subject to droughts; much more so than Bengal, is it not?—Yes.

4979. And therefore the crop in Malwa is a more precarious one than the crop in Bengal?—I do not think that the drought in Malwa would affect the opium.

4980. Mr. R. Fowler.] I did not exactly understand your answer to the honourable Member as to what the revenue was which the native princes of Malwa raised from the opium; we raise, I believe, a transit duty of 600 rupees a chest?—Yes.

4981. It was 500 I think you stated when you left India, and it is now 600?—Yes.

4982. But how much a chest is paid to the Native states before it comes into our territories?—The cultivators produce for their own living grain, and the advances that are made to them for

for opium are generally paid over for the revenue. If the opium fails, of course the contractor loses, but the cultivator is secured by the opium chiefly for his revenue.

4983. The contractor is a private individual?—Yes.

4984. Then a large proportion of the land of Malwa is taken up in the cultivation of opium, is it not?—Yes, a good deal; a very small quantity of land will produce a very large quantity of opium. It is generally a sort of garden culture immediately round the villages, where they can easily collect it.

4985. What is the effect on the population of the cultivation of opium; do they consume it themselves?—Very little.

4986. It is not used by the population?—A very small quantity is consumed in the country.

4987. Then opium consumers are rare there?—Yes.

4988. Does it affect their health injuriously?—Certainly.

4989. Whether it is either eaten or smoked, it generally produces very serious effects on the health?—Certainly; opium eaters are very soon unfit for any active pursuits. It is very debilitating.

4990. And it shortens their lives?—Yes.

4991. You expressed an opinion that it would be well to substitute a transit duty, for the present system of Government cultivation in Bengal?—The Government monopoly in Bengal gives great encouragement to the cultivator. He has privileges which make him quite ready to cultivate the opium. Of course, those privileges if it were thrown open to the general public would be withdrawn. The opium cultivators crop cannot be attached by anyone but the Government; the Government has the first lien upon it.

4992. I think that it was put to you by the honourable Member just now, that the objection to that was, that it was much more easy to levy a transit duty in Malwa, where the opium must pass through narrow passes, than in Bengal; could not that revenue be guarded by the same number of officials as we have now?—If the system of Bengal was assimilated to that in Malwa, there would be centres to which the opium would be brought. Opium not brought to those centres would be smuggled and liable to confiscation; that which came to the Government depôt, at the scales, would receive a pass and go to the seaboard at once.

4993. We have a considerable staff of officials looking after the present cultivation, I believe; I suppose the expense would not be greater in keeping officials to prevent smuggling?—Certainly not.

4994. Mr. Dickinson.] Is there anything to prevent Holkar levying duty on opium?—No, he gets eight rupees a chest for all that passes the scales.

4995. We raise a duty within the limit of the purchasing price in China?—We raise a duty without reference to Holkar or the cultivators.

4996. We levy such a duty as the prevailing prices in China for the time being will allow?—Yes.

4997. Supposing Holkar was to raise 300 rupees a chest, in addition to what he now does, we must reduce our duty 300 rupees a chest, must we not?—It would be a question between him and the Government.

4998. If Holkar were to raise a duty of 300

rupees, that would necessarily involve our reducing ours 300, would it not?—Or his being made to give way; he would not be consulted.

4999. We should, in fact, prevent his levying any duty that would interfere with our revenue. We should take care that all the revenue from opium comes to our exchequer?—That we should not be losers.

5000. There is no existing treaty or anything of that kind which prevents Holkar from levying a higher duty?—No; but a treaty might be construed into that, perhaps.

5001. Mr. Beach.] The cultivation in Malwa is profitable to the cultivator after the advance has been made?—Certainly, the cultivator agrees before he takes it that the person who makes the advances shall pay the revenue.

5002. Does he make fair profit, himself, in addition?—Yes; but his great security is, that the revenue is paid.

5003. But there are plenty ready to come forward and engage in cultivating it?—Yes.

5004. From the information which you have received, do you think that they are cultivating it to a much larger extent than China?—At one time, you know, it was prohibited entirely; and now it is prohibited, I believe, to this extent, at least according to the last accounts I have, that any person growing opium would have his head cut off. But no heads have been cut off, and the opium growing has been greatly increased.

5005. Do you think that it will materially interfere with the export from India?—The quality of the drug in China is said not to be good. It will all depend upon the quality of the drug. If they can cultivate it up, of course, if they can supply their own demand they will not want the opium from India.

5006. But being novices in the art of cultivating it possibly, it may not be so valuable at present?—They are novices, and they are novices with the dread of being punished.

5007. I wanted to elicit whether you thought the cultivation of the poppy in China was likely to render that source of revenue in India essentially precarious?—If the Government allowed it in China, it would interfere with it very seriously, provided it were good opium. Opium, is as necessary in China as spirits are in Europe.

5008. Mr. J. B. Smith.] As far as I understand you, you recommend that the Government should abandon the cultivation of opium in Bengal, and should confine itself to supplies from Malwa?—My recommendation is that Government should withdraw from the cultivation and throw it open to the public, to anybody who chose to cultivate it.

5009. You do not mean by that, that they should confine themselves to the supply from Malwa?—No; if anybody will grow it in Bengal let him.

5010. And have you reason to think that it can be grown in Bengal on the same principles on which it is grown in Malwa?—That depends entirely on whether anyone will grow it; the Government have an unlimited power of making advances; but whether merchants would do so is another question.

5011. But as India depends so much for its revenue on opium, would it be wise for the Government to run any risk of that kind?—I should think it would be wise in the Government to increase the cultivation in Malwa, where it costs them nothing.

5012. Do

5012. Do you think it would be politic to confine yourself to one source of supply?—But I do not think the supply would be limited to one source; if it is profitable, the people in Bengal would grow it. If the mercantile community were to find it profitable to make advances to grow opium in Bengal, they would grow it; if it is not profitable, they will not grow it; now, the Government grow it entirely.

5013. You think if it were thrown open in that way, the Government would run no risk of failing to get as good and large a supply of opium as it does at present?—The question is, whether there would be the same desire to get it there, or whether they would go to other places to get it.

5014. But is not that a most important consideration for the Government?—As long as they depend upon opium for their revenue, they must get it the best way they can.

5015. But they do depend upon it to a very large amount?—Yes.

5016. Would there not be danger in the Government making any alteration which might interfere with the supply of it?—My proposal was that they should gradually withdraw, and of course if they found that in gradually withdrawing they could not keep up the supply required for China, they would not withdraw entirely, but would go on with their own cultivation.

5017. Have you any idea whether the Government could do without the revenue from opium; it is an absolute necessity to them, is it not?—Yes, they must have the revenue.

5018. Mr. Lyttelton.] Did I rightly understand you to say, that the only deduction to be made from the 600 rupees a chest, was $1\frac{1}{2}$ per cent., or only nine rupees a chest for all charges? The total charges according to this return are these; the cost of collection in 1862–63, was one anna and a-half.

5019. So that 591 rupees a chest represents the net revenue per chest to the Government?—Yes.

5020. But do you maintain, even taking that large sum to be correct, that the Malwa system is more profitable than the Bengal monopoly?—The Malwa opium in Bombay depends entirely upon what it will sell for in China, and the China market is affected a good deal by the supply from Bengal.

5021. What the Government make is 591 rupees per chest, and the Government then have done with it?—Yes, the Government get 599 rupees a chest.

5022. But, taking Sir Cecil Beadon's figures, even that large sum is 200 rupees a chest less than what the Government receive on average years per chest in Bengal. Sir Cecil Beadon's computation is this, that assuming Bengal opium sells for 1,200 rupees, and the cost of production of a chest of opium is only 400 rupees, Government makes a profit of 800 rupees?—I do not

know what the basis of the calculations of the expenses is in that case.

5023. But have you gone into the question as to the relative financial advantage to the Government of the two systems?—I do not know whether interest on money is calculated, for instance.

5024. But on the face of it, the Bengal system is more profitable?—On the face of it it is 200 rupees better.

5025. Mr. Crawford.] Do you recollect the time when they used to send the opium through the Desert to Kurrachee?—Yes.

5026. And it was taken from Kurrachee down to Damaun, the Portuguese settlement?—Yes.

5027. And that trade was put a stop to when the pass duty in Bombay was raised from 125 rupees to a higher sum?—Yes.

5028. And it was the object at the time of raising the duty to stop that trade from which the Bombay Government received no revenue?—Yes.

5029. It was stated a day or two ago, that as much as 15,000 chests of opium were now exported from Damaun; do you believe that to be the case?—I do not know now; but it was not the case 10 years ago.

5030. Is there any way by which the opium can get to Damaun?—Not that I am aware of.

5031. It comes from Malwa to Bombay by railway, mostly now, does it not?—It comes to the point of the railway nearest to Malwa, and then on to Bombay.

5032. And it was stated, also, that the advances made to the cultivators in Malwa are made by people in Bombay. You recollect, I dare say, the names of Huttosing, Kissrising, and Motichund Amichund, old Ahmedabad, bankers; I suspect that it was their money in a great degree, that was advanced to the cultivators?—It is called the Bombay Merchants, but I fancy that some of the principal merchants in Malwa make the advances.

5033. There was a great deal more money in Malwa available for those purposes than there was available for the purpose in Bombay?—Yes.

5034. And very wealthy people indeed, people who had banking establishments in every town, nearly in the centre and north of India?—Yes.

5035. Chairman.] You have never been employed in the opium-growing parts of Bengal proper, have you?—Not latterly; I was at Gazeepore for some time.

5036. You know nothing of your own knowledge of the difficulties that there might be in the way of introducing into the Bengal Provinces, Bengal and Behar, the system which you yourself have seen at work in Malwa?—No; I have not for many years been there.

5037. You speak from the results of long reading, and what you have heard, not from your own knowledge?—No.

RIGHT HONOURABLE ACTON SMEE AYRTON, IN THE CHAIR

Mr. GEORGE SMITH, LL.D., called in ; and Examined.

Mr.
G. Smith,
LL.D.

19 May
1871.

5038. *Chairman.*] HAVE you resided long in Bengal?—About 17 years.

5039. In what part chiefly?—Chiefly in Calcutta and the neighbourhood.

5040. You have been engaged in literature there, I think?—I have been engaged in journalism there, and also in educational work.

5041. Have you had any opportunity of informing yourself of the state of the opium cultivation in Bengal?—I have visited the factory at Patna and the poppy fields of Shahabad, and have also spent some time at Indore, watching the different system of cultivation and manufacture which obtains there.

5042. Did you investigate it for any specific object, or for your own information?—In 1862 charges were brought in the public newspapers against the opium establishments in Bengal; and in order to inform myself on the subject, I visited both Patna and Indore in the years 1863 and 1864.

5043. Can you state generally, without going into details, the character of those charges?—They were chiefly charges of oppression and corruption against the native establishment in Patna, and also of carelessness on the part of their European superintendents.

5044. Will you be good enough to state what was the result of your investigations, or what information you obtained in the course of your investigations?—I came to the conclusion that the charges were grossly exaggerated; but that, nevertheless, there was a sufficient basis of truth, as admitted by the Lieutenant Governor, to lead the Government to consider the question whether the excise system of Bombay would not be preferable, on all grounds, to the monopoly of Bengal.

5045. In what way would you work out the excise system of Bombay in Bengal?—It would be easy to introduce the excise system into Bengal district by district, so that as private cultivators were licensed in one district, where the poppy is now cultivated, the Government should abstain from working its own monopoly. Should the experiment be successful, Government might gradually retire from the monopoly, and the revenue would not suffer at all, or only temporarily.

5046. Then would you have allowed the cultivator to make his own opium, and sell it on payment of a fixed duty per pound?—To sell it only to licensed traders under a somewhat heavier acreage tax than already prevails in the Punjab.

5047. You would not levy the duty on the opium, but on the acreage of cultivation?—Upon both. The cultivator would pay the duty on acreage, and the licensed trader or manufacturer would pay a heavy duty to the Government on the manufactured article.

5048. But would not that have the effect of imposing upon the cultivator the necessity of obtaining considerably more capital than he now employs in the cultivation?—The licensed trader would undoubtedly be forced to pursue the present system of Government, and of almost all agricultural capitalists, in making advances to the cultivators.

5049. Unless that were done the cultivator would hardly be able to keep on his cultivation and pay the duty as well as his own rent?—It would be impossible for the cultivator to carry on the cultivation without advances, whether in opium or in indigo, or in almost any other agricultural product.

5050. Then do you propose that the Government should superintend the factories in which the opium was made, to prevent any smuggling by the person who received the raw material from the cultivator?—Only in the way in which distilleries in this country are superintended by the excise department.

5051. Would you allow the manufacturer to transmit his own opium to any place which he pleased for sale?—Certainly, outside of India, under passes such as exist in Bombay.

5052. That is to say, he paying a certain duty on the spot when he sent it out of his factory?—Yes.

5053. And in what respect do you think the community would be benefited by that change of system?—The community, I think, would be benefited morally and financially. Morally, in fact, and in the eyes of the natives, and of many non-official Europeans in India, the whole responsibility of the growth and manufacture and consumption of opium falls upon the Government of India, and, as such, upon the people of England.

land, and so far brings the Government into disrepute. The Government is exactly in the same position as the Chancellor of the Exchequer would be in this country if he were to organise and manage a monopoly of distillation. Financially, under the monopoly, the Government is exposed to all the risks of the trader in a trade which it cannot understand; and hence the precarious character of the opium revenue, and the frequent deficits, as shown by the fluctuations of that revenue, contrasted with the finance minister's annual estimates. As a matter of political economy the law of supply and demand would then have fair play in opium as well as in almost all other productions in India, and the Government would be able to calculate on as almost certain a revenue as they do in the case of the customs.

5054. You think that if the Government took a fixed duty the ordinary rules of the market would regulate the supply, and practically the Government would have a uniform receipt?—Quite so; at the same time the control of the area of cultivation would remain entirely in the hands of Government as at present, certain districts being reserved for the cultivation of the poppy.

5055. But do you find that that view which you have stated is borne out by the produce of opium in Malwa where the Government does not cultivate?—When I went to Indore I came to the conclusion that the experience of the Government in Malwa was in favour of the excise system. In the year 1865–66 Malwa opium contributed 2,128,000 *l.* net to the revenue, with no outlay save 3,258 *l.* In the same year the Bengal monopoly yielded 4,499,000 *l.* net, but expended 1,891,000 *l.* The one was 2,131,258 *l.* gross, and the other was 6,390,000 *l.*

5056. But with regard to the uniform result as affecting the Budget, do you find that any uniformity has resulted from the Malwa system of levying a fixed transit duty?—It is impossible that the Malwa system should have fair play so long as it is sacrificed to and checked by the monopoly.

5057. Did you ascertain that the quantities grown in Malwa from year to year were based upon the operations, or supposed operations, of the Government in Bengal?—The quantity sent forward to the scales, practically, varies according to the pass-duty exacted, and that pass-duty, which rose at one time as high as 700 rupees a chest, is avowedly imposed as equal to the monopoly price of opium in Bengal.

5058. But from what figures do you derive your view, that the quantity was regulated by the pass-duty in Malwa; have you any figures there that would lead you to that conclusion?—It would be possible to bring that conclusion out of the figures.

5059. I will read you some of the figures. In 1857–58 the duty was 400 rupees a chest, and the produce was 36,000 chests. In 1858 the duty was the same, and the produce was 40,000 chests. In 1859 the duty was increased by 100 rupees, namely, to 500, and the produce was 32,000 chests. In 1860 it was raised to 600 rupees, and the produce was 43,000 chests. In 1861 the duty was raised to 700 rupees, and the produce was 38,000 chests. In 1862 the duty was 700 rupees a chest, and 600 rupees part of the time, and the produce was 49,000 chests; and in 1863 the duty remained at 600 rupees a chest, and the produce 0.59.

was 28,000 chests; do you think that from that it would be easy to build up anything of the ratios of duty and produce?—Probably not. The way to put it would be this: both Malwa and Bengal opium are exposed to unknown conditions in China; but Malwa opium is free from certain risks to which Bengal opium is specially exposed, as being a cultivation and manufacture, and a trade conducted by Bengal civilians, who are necessarily ignorant of the whole question.

5060. When you pursued your inquiry into the Malwa opium produce, did you ascertain on what principle the cultivation of the opium from year to year was started in Malwa, who started it, or who set the thing agoing?—Bankers, who would be equivalent to the licensed traders, who would probably arise in Bengal were the monopoly abolished.

5061. Do the bankers send for the cultivators and invite them to cultivate, or do the cultivators go to the bankers and say “We should like to cultivate, give us an advance”?—Large dealers work through the village bankers as middlemen, who use their influence with the cultivators to give up so much soil to the poppy, and receive the produce from them at the proper time.

5062. Then do you think that the brokers, or intermediary agents, are the stimulators of the operation from year to year?—To some extent; but to a great extent the price. The cultivation is undoubtedly profitable.

5063. Then the broker, judging by the price of opium in Bombay, I presume, sets the people in motion; that is to say, the intermediate agent between the banker and the cultivator?—Quite so; but to a great extent, both in Malwa and in Bengal, the trade is one of pure speculation.

5064. If that be so, would not the speculation be carried on to a considerable extent irrespective of the rate of duty levied by the Government, but upon considerations of price, assuming the duty to be such as not to prevent the cultivation being remunerative?—It is so in Bombay, on the part of the purchasers and exporters of the chests.

5065. But would it not be so on the part of the growers?—I think not.

5066. What I am anxious to ascertain from you is, what is the motive for growing, or what are the circumstances which influence the growing of more or less opium in Malwa, where we see that it fluctuates so much from year to year?—The soil is less favourable, and cultivation is continued long and is very profitable.

5067. But did you ascertain what were the motives which led to the increase or decrease of cultivation between one year and another?—Not beyond the influence of climate, the want of rain, and so on.

5068. Did you find much difference between the social condition of the cultivators in Malwa and that of the cultivators in Bengal?—Very little, the cultivators in Malwa being residents in native states, and therefore liable at any moment to an increase of rent or of land assessment.

5069. Did you find whether they were the owners of the land that they cultivated, liable only to pay the assessment, or whether they were mere tenants from year to year?—Generally tenants; but I was there in the year 1864, before the great cotton wealth affected the agricultural population of Western India and Central India.

5070. Then these persons being merely tenants, was there some middleman between them and the

Mr.
G. Smith,
LL.D.

1871.

Mr.
G. Smith,
LL.D.
19 May
1871.

the native government with regard to the land revenue?—Generally they may be said to be peasant cultivators in the part of Malwa through which I passed, holding direct from the agents of Holkar, who has lately introduced a survey and settlement of the land upon our own system.

5071. But at the time that you were there, were these peasant proprietors settled with for the revenue for a year only, or for several years?—For no fixed time; at the will of Holkar.

5072. Did you ascertain what was the rate of assessment to which they were liable?—Not at that time, but since then very serious complaints have been sent up to Government, because Holkar, avowedly imitating our policy, has rack-rented the peasantry by increasing the revenue of that period some 45 per cent.

5073. In what respect do you mean, imitating our policy of rack-renting?—Imitating our policy of the periodical increase of the land revenue, not as to the degree to which the increase is put on.

5074. That is to say, he made a new settlement, but he rack-rented instead of taking half?—Quite so.

5075. Do you consider that an imitation of the policy of the British Government, or the reverse?—It is an imitation of the policy of the British Government as to the periodical revision of land revenue, but not as to the proportion that is exacted.

5076. Sir D. Wedderburn.] The poppy of Malwa is quite a distinct variety from the Bengal poppy, and I fancy that the soil and climate of Malwa are also very different, which may account for the superior quality of the Malwa opium, may it not?—All that is so, and the manufacture is different.

5077. And are you aware that while the strength of the Bengal opium, as sold at the Government factories, is 70 per cent., that of the Malwa, we have been informed by a previous witness, is 90 per cent.?—I believe that to be so; the moisture being greater in the one case than in the other.

5078. But in China, whereas the chest of Malwa opium is subjected to careful analysis before purchase is concluded, the chest of Bengal opium with the Government brand is purchased, at once, without further inquiry, so great is the confidence of the Chinese merchants in the purity of the Bengal article; are you aware that that is the case?—I was always under the impression that the chest of Malwa opium, which is also carefully examined by the Government officers at Indore, when the duty is exacted, was received in China with as much confidence as the Bengal opium.

5079. The reverse is stated in a Government document which was placed in our hands a few days ago. Do you think that if the two countries were placed on exactly the same footing, Bengal could compete with Malwa in the growth of the poppy?—Certainly, but compete in the same sense in which cigars of different growths and flavours compete with each other.

5080. You said that if such a system as you suggested were adopted, you thought that the revenue, instead of being very fluctuating, would become more certain, or quite certain. Do not you think that there are causes affecting the opium revenue over which no system that we adopt can exercise any control whatever, and that it must in its nature be of a fluctuating and uncertain nature?—

I do not think that there are causes which should make it fluctuate more than any other great article on which customs duty is paid.

4081. Is it not the case that the crop is very uncertain in amount, and that a heavy shower of rain during the harvest will pretty nearly destroy the crop in one locality?—Were the trade entirely in the hands of skilled private capitalists it would be easy to draw an average of years, and to foresee what the revenue is likely to be for a period of years to a much greater extent than it is where you have a monopoly conducted by officials, who avowedly have no knowledge of the subject.

4082. You said that the area of cultivation under such a system would still be under the control of the Government. I should like to have that explained, because it seems to me that it would be retaining a monopoly to a certain extent if you retain the power of limiting the area of cultivation?—The area of cultivation would be necessarily restricted for excise purposes. Just as there are distilleries, so there would be licensed factories to which the crude opium would be brought, as at present, but these factories would be the property of the licensed traders, who would pay whatever duty the Government might think fit to exact.

5083. And in whose hands would be left the discretion as to limiting the area of cultivation?—It might be left to the new agricultural department, or the existing abkari department.

5084. Would not they be liable to the same objection, of ignorance of the details of the opium trade, which the present superintendents are liable to?—They would act on the application of the licensed traders very much as the justices act in this country on the application of publicans.

5085. With regard to Holkar, can you explain how it is that while he is rack-renting his people in the way that you describe, he consents to our monopolising what we are told is equal to 9-10ths of the opium revenue from his territories?—We made an agreement with Halkar in the year 1826, and with all the other states in Malwa, securing to the British Government the exclusive right to purchase opium grown in Malwa. At that time the monopoly existed in Malwa exactly as it does in Bengal now, but it led to such serious evils, and to such extensive smuggling, that the present system was adopted.

5086. You gave us some figures just now illustrating the relative expenses of collection under the two systems in some recent years. Now, I find, on the average of a number of years previous to the date which you gave, that the total expense of collecting the Bengal opium amounted to about 10 per cent. as near as possible on the total outlay; can you explain how it is that the per-centage of outlay seems to have increased of late years, because by your figures it has very considerably increased?—Does the 10 per cent. refer to the cost of establishments, or to the advances given to the peasantry, or to both.

5087. It refers to cost of establishments, transport, and all the money actually spent in collecting, but does not include advances?—I have ascertained that in the year 1867-68 the actual cost of the opium, apart from the advances, was 361,000*l.*, which should be set against the 3,000*l.* or 4,000*l.*, which is the cost to the British Government of the opium establishments in Malwa. This cost in Bengal does not include the very large

large sums sunk in buildings, and annually spent upon repairs by the Public Works Department.

5098. And have you any reason to think that, supposing the monopoly were abolished, we could by any preventive or excise system collect your revenue for the trifling per-centage for which we have hitherto been able to collect the revenue on Malwa opium?—It could be collected, I believe, without any serious addition to the cost of the present abkari department.

5099. Are not the facilities for smuggling very much greater in Bengal than they are in Malwa?—Very much, and hence an argument for the Malwa system. I had reason to ascertain last year from the detective police in Calcutta, that the smuggling has become so very serious, as to induce the Bengal Government to appoint a special body of police for the purpose of prevention. Smuggled opium comes down from the upper provinces partly in boats, which are covered with onions, in order to destroy the smell, and hide of course the article; but to a much greater extent by railway in the folds of the clothing of the native agents of the bazaar merchants who pursue the trade in Calcutta.

5090. From the Upper Provinces?—That is to say Behar and Benares.

5091. From the districts where it is cultivated under the Government system?—From the opium districts.

5092. And do you consider that under an excise system it would be easier to prevent such smuggling than it is under the present system?—It would be absolutely preventible. The self-interest of the licensed trader acting on the self-interest of the cultivator, would produce the same absence of fraud that we meet with in other transactions of the same kind. Where Government is the manufacturer and owner, and works through a large body of unprincipled native agents, the fraud is very extensive. The fraud has been confessed to officially by the most intelligent of the opium agents. When under examination before the Indigo Commission of 1860, Mr. C. Hollings, sub-deputy opium agent, admits that, in spite of the severe contract law, Act 13 of 1857, and the occasional distraint of property to meet bad balances, it is impossible to be sure that the cultivators make over the whole of the opium which they prepare from the poppy.

5093. Mr. R. Fowler.] Do you know the native opinion as to the working of the excise duty?—The excise system on both liquors and drugs in India is so unpopular with the natives, both educated and uneducated, that it forms a frequent subject of discussion in the native newspapers and debating societies. Some of the ablest of the educated natives, and especially of the absentee zemindars of Bengal, who reside in Calcutta, have fallen victims to drunkenness to such an extent that efforts have been made by the natives themselves to establish total abstinence societies; and native literature is full of pamphlets and dramas illustrating the evils of drunkenness.

5094. How would you check the evil?—In two ways; by largely increasing the duty upon all indigenous and some imported liquor, and by reforming the system of giving licences. The duty on liquor imported was doubled by Lord Canning in 1859, as a financial measure, and with perfect success. Since then the proportion of the rise of prices alone would justify a large increase, and the necessities of the State demand it as a financial

measure. Such an increase would be most popular with the natives. As to the licensing system, it works at present in the following way: The excise department is nominally under the superintendence of the covenanted collector of each district, but is practically left to an uncovenanted deputy collector, who may be a native. The Board of Revenue, in Bengal at least, with which I am best acquainted, in its annual reports, holds up to public censure those collectors and deputy collectors in whose districts there may have been a falling off, or where there has been no proportionate increase of the excise revenue; and thus from the head of the district department to the lowest native underling, it is the interest of the excise officials to establish shops wherever they can.

5095. Could the duty be increased without risk of smuggling?—Certainly; to an extent which would not hold true of this country, or of any European country, because, both by creed and by climate, the Hindu and the Mahometan are forbidden to indulge in intoxicating liquor; and the whole public opinion of the natives of India would be in favour of much more repressive measures than might be justifiable.

5096. How would you improve the licensing system?—By uniting with the excise officer the town municipalities wherever they exist; and where they do not exist, a committee of the most respectable inhabitants of the town or district. The present system of licensing is objected to, not only by the mass of the people, but by the police, who find it the greatest promoter of crime. To such an extent was this the case in Calcutta, that some years ago the commissioner of police, in vain urged the local government to give him co-ordinate power with the excise authorities in granting licenses.

5097. Does the excise department promote the consumption of opium in India as zealously as that of alcohol?—In the Indo-Chinese districts of British Burmah, the action of the department in promoting the sale of opium has long been a public scandal. The evil has been officially reported to the Government of India by the late Chief Commissioner, Sir Arthur Phayre; and in a published official report by Mr. Wheeler, secretary to the present Chief Commissioner, the evil is again described for the information of Government in the following language: “Mr. Hind, assistant commissioner, came on board. This gentleman appears to have a large local experience of Aracan, dating back from 1835. The principal object of his conversation was to impress me with the demoralising effect of the Bengal abkari laws upon the impulsive pleasure-loving people of Burmah; and certainly he furnished sufficient data to prove the utter fallacy of the general conclusion, that what is good for India is good for Burmah. Prior to the introduction of British rule into Aracan, the punishment for using opium was death. The people were hard-working, sober, and simple-minded. Unfortunately one of the earliest measures in our administration was the introduction of the abkari rules by the Bengal Board of Revenue. Mr. Hind, who had passed the greater part of his long life amongst the people of Aracan, described the progress of demoralisation. Organised efforts were made by Bengal agents to introduce the use of the drug, and to create a taste for it amongst the rising generation. The general plan was to open a shop with a few cakes of

Mr.

1871.

Mr.
G. Smith,
LL.D.
19 May
1871.

opium, and to invite the young men in and distribute it gratuitously. Then when the taste was established, the opium was sold at a low rate. Finally, as it spread throughout the neighbourhood, the price was raised, and large profits ensued. Sir Arthur Phayre's account of the demoralisation of Aracan by the Bengal abkari rules is very graphic, but Mr. Hind's statements were more striking, as he entered more into detail. He saw a fine healthy generation of strong men succeeded by a rising generation of haggard opium smokers and eaters, who indulged to such an extent that their mental and physical powers were alike wasted. Then followed a fearful increase in gambling and dacoity."

5098. What is the date of that?—It happened in 1870, and this pamphlet is published by the Government of India in 1871. I should add that in matters of excise, and of opium, the Bengal Board of Revenue has influence beyond the jurisdiction of Bengal proper, and is not directly controlled by the Government of India.

5099. Are you aware how long the subject of converting the monopoly into an excise system has been under discussion by the Government of India?—It was discussed first about 1825 with reference to Malwa opium; and Colonel Sutherland, then the distinguished Resident at Indore, stated that at that time the Government "avoided the agency of the most distinguished of their servants, Sir David Ochterlony and Sir Charles Metcalfe, whose opinions were known to be adverse to the system, and went to work either through the medium of the opium agent who had been established in Malwa and Rajpootana, or directly with the local agents at the several courts." But the result was "a sort of civil war," and the abolition of the monopoly in Malwa. In 1856 the North Western Provinces Board of Revenue, seeing the evils of the monopoly system in their jurisdiction, referred to Sir Robert Hamilton, then Resident at Indore, for information as to the working of the Bombay excise system. The papers were destroyed in the Mutiny, and a second reference was made in 1858, when Sir Robert Hamilton gave a still stronger opinion in favour of the excise system. The discussion went on with the Government till 1863, when Sir Charles Trevelyan was finance minister. He became a strong convert to the excise system, and the whole subject was ripe for being sent home to the Secretary of State in Council, with the favourable opinion of Lord Lawrence's government, when Lord Lawrence's term of office expired. Since that time I am not aware that the discussion has been advanced.

5100. What are the objections to the monopoly system which do not apply to the excise system?—I have already partly answered that question. There is the moral objection that the monopoly makes Government as responsible in the eyes of the natives as Russia was for the brandy manufacture, and as England would be if the Chancellor of the Exchequer were the sole producer of malt, and the sole distiller. There is the economic objection that the law of supply and demand is violated, and a most delicate trade is conducted by officials necessarily ignorant of all commercial questions and operations. There is the financial argument that the precariousness of the revenue would be greatly reduced, if not removed, by giving to opium the same certainty as the customs revenue. If Government at present gets the traders' profits, which

is confessedly the only argument for the monopoly, that is more than counterbalanced by its suffering the traders' risks. Then, too, the excessive cost of the opium establishment would be saved.

5101. Are there any abuses in the practical working of the monopoly?—The examination by the Indigo Commission in 1860, and the Lieutenant Governor's inquiry in 1862, showed that the cultivation is protected by a severe contract law denied to all other products, and frequently put into operation in the shape of distraint of property. Then, too, smuggling is excessive. Again, official pressure is avowedly used to extend the cultivation. Mr. Hollings informed the Indigo Commission that "all the members of the department are constantly engaged in using their best endeavours to extend the cultivation, with the consent of the parties engaging, and everything in the way of fair inducement and persuasion is not only permitted, but encouraged." The cultivator suffers, on the one hand, from the landlord, who increases his rent, at which the law winks, being "practically obsolete," according to the statement of Mr. Hollings; on the other hand, from the middle-man, to whom he has to pay what is called khurch (expenses) every time that the middle-man visits the head factory; from the interference of the native officials, who dictate what crops the cultivator shall put in the ground when the poppy has been cut; and from the presents which are confessedly made by the cultivators to the native underlings of the opium establishment.

5102. Mr. B. Denison.] To what middleman do you refer?—The kattadar.

5103. Mr. R. Fowler.] Does the poppy displace grain crops?—There have been two serious instances of that within the last few years. In Malwa when the people of northern Rajpootana streamed down to avoid the famine they found no food, because Malwa is a food-importing district, being so largely devoted to the poppy; and thousands perished from starvation along the high road on their return to their own districts. This has occurred in Western India in the case of every great famine. In the Bengal famine of 1866, Mr. Cockerell, the official commissioner of inquiry, reported to Lord Lawrence's Government the case of the poppy cultivators in Sarun, whose crop had been destroyed by hail, but who nevertheless were so refused by the opium officials, remission of their small balances, that their landlords followed the example, and a considerable loss of life and very great suffering was the result.

5104. Mr. B. Denison.] What do you mean by paying up the balances?—The advances from the Government.

5105. Mr. R. Fowler.] Is the cultivation of the poppy still being extended widely in new districts?—The cultivation is being very largely extended owing to the fear of competition in China; Government has adopted the policy urged by Mr. Wilson in 1860, of producing a large quantity of opium and selling it at a low rate in order to save the revenue. The extension of the cultivation in totally new districts in the North Western Provinces and Oude has called forth serious complaints from some of the high officials there who have not been consulted, and who are opposed to the extension as interfering with food crops and the contentment of the people.

5106. Is not the effect of the system of advances to keep the ryot in debt to the Government

ment and therefore to prevent him from acting as a free agent?—Not much more so than if a private capitalist made advances. The evil of the system lies in the poverty and ignorance of the people. Both Government and the capitalist would be delighted to get rid of the necessity of making advances were it possible.

5107. If a ryot owing money to the Government wished to cultivate some other crops than opium, would any obstacle be placed in the way of his doing so?—Practically he would be influenced or prevented by the native officials of the department.

5108. Does the Government price paid to the ryot represent his actual profit on the transaction?—Not the whole of his profit, because he is allowed to put in light crops when the poppy has been cut.

5109. Is it not true that although the kattadar, who acts as middle-man between the Government and the ryot, is nominally chosen by the landlord, yet, as a matter of experience, he is appointed by the Government?—Practically, I believe it has been so.

5110. Is it true that the business of the kattadar is to undertake the oversight of the whole katta (or opium section), to make good defalcations or failure crops arising from neglect, to prevent contraband sales, and to provide tenants who will take the place of absentees?—That seems to be a fair description of his actual duties.

5111. Is it true that the only compensation he receives is 1 rupee for every maund of opium?—I cannot tell that; he receives considerable compensation from the cultivators.

5112. Have you ever heard of illegal exactions levied on the ryots by the kattadars?—It was admitted by the opium officials before the Indigo Commission of 1860 that such exactions are common, but they cannot be prevented.

5113. I believe some years ago difficulties arose with the opium ryots, which led to their receiving better prices for their crops?—That was in 1858-59. The difficulty was so serious that the Government called upon the opium agents and the deputies for confidential reports. As a specimen of these reports, I may quote two lines from Mr. A. H. Turnbull, sub-deputy opium agent in Cawnpore, to the Benares opium agent at Ghazepore. He writes on the 17th of August 1859: "I beg to inform you that the cultivators are deriving larger profits at present from grain than from opium; *vide* statement annexed." The result was that the price paid by the Government was raised from 3 rupees 4 annas to 3 rupees 8 annas a beegah, and subsequently higher.

5114. Have those prices given satisfaction since that time?—I believe so.

5115. Has your attention been called to the case mentioned by Sir William Muir, in which cultivators in the country west of the Jumna, "an unwilling peasantry," as he calls them, were induced to cultivate the drug by the bait of large advances, although previously it had never been grown in those districts?—I have heard of such cases, but the only similar case that I know of occurred on the introduction of the poppy cultivation into Oude after annexation, when the people refused to take the advances.

5116. Is it true that the public sales of opium by the Government have led to an enormous amount of gambling, and to the ruin of many

mercantile houses?—It is true in one sense; but the Jews and Moguls, who chiefly engage in the trade in Calcutta, are such large capitalists that they can afford to set the losses of one year against the gains of another. The auction sales in Calcutta have hitherto been one of the great sights of that city, from the excitement, almost amounting to tumult, which attends them.

5117. Is it not true that a vast amount of litigation has arisen out of opium time bargains?—Not recently in Calcutta. Such bargains are generally settled out of court; but I believe that that has been the case in Bombay, but not to such an extent as with cotton and other products.

5118. Is there any foundation for the statement made by a Bombay journal, that the trade in opium is systematically, and, on conscientious grounds, avoided by a greater or less number of native gentlemen?—I cannot speak for native gentlemen, but it is so with more than one English merchant of Calcutta, who has refused to touch the trade.

5119. You alluded to the demoralisation produced in Burmah; is it not the fact, that the English Government have discouraged the use of opium among our subjects in India?—Only in Assam, and that chiefly from both financial reasons. The cultivation in Assam was free, so that it was impossible to sell our own opium there. On the other hand, the consumption was so universal, from the infant upwards, that the people would not work, and it was found necessary and just to increase the land revenue and stop the free cultivation of the poppy. Since that time the consumption of opium in Assam has diminished, a considerable revenue has been given to the opium department, and the land revenue has been largely increased.

5120. What is your opinion of the result of the consumption of opium on the physical and moral condition of the people?—With the exception of certain creeds and castes, such as the more wealthy Mahomedans of Patna, the nobles of Rajpootana, and the Sikhs of the Punjab, there seems to be no general taste for opium in India. Where it is largely consumed the effect is debility both mental and physical; but on a large scale, abuses from the consumption of opium are not great in India, so far as I know.

5121. Mr. Birley:] If the excise system with regard to opium were introduced into Bengal should, in your opinion, the administration be confided to the Bengal Board of Revenue?—The Bengal Board of Revenue looks only to revenue considerations; the action of that Board, and of the Excise Department, should be modified by the opinion of the respectable residents in each municipality and village.

5122. Then you would associate the respectable residents, as you term them, in municipalities and villages, with the Board of Revenue in the administration?—Yes, so far as local consumption is concerned.

5123. You have said that the revenue would be rendered less precarious if the excise system were introduced into Bengal. The returns before us seem to show that in Malwa the revenue was as precarious as in Bengal; was that because the competition between the two caused the production to be more precarious than it would be if there were a uniform system in both?—Quite so; the Malwa system is so affected by the monopoly in Bengal, that it cannot act freely and uniformly.

Mr.
G. Smith.
LL.D.

19 May
1871.

Mr.
G. Smith,
LL.D.
19 May
1871.

5124. Mr. Beach.] As the consumption of opium is comparatively small in India, and is almost entirely confined to China, it is only the cultivators there, and not the consumers, that are affected by the revenue raised from it?—Yes.

5125. There is no less a sum than about a million and a half advanced by Government to the cultivators in Bengal?—Yes.

5126. That does not come back to the Government till the chests of opium are sold?—No.

5127. Therefore a sum of a million and a half is practically fructifying in the pockets of the cultivators during that period?—In the form of advances.

5128. There are a great many ready to come forward, I believe, whenever advances are offered to be made by the Government, because they consider it profitable, do they not?—Yes, when the price is as high as it has been for some time; but when it fell below 3 rupees 8 annas, then it was found difficult to induce the cultivators to come forward; there is another reason, it takes three years to prepare the soil properly for the poppy. Once prepared, the cultivator is committed to a long course of poppy growth, and is unwilling to retire from the cultivation unless he has to receive, year after year, too low a price.

5129. And that would prevent him converting the ground which had once been prepared for the poppy into ground for the cultivation of corn?—He would consider it too good for the cultivation of corn.

5130. But would he not take the chance of one year being more profitable than another, and of the sales proving better?—The sales do not affect the cultivator in Bengal; he receives a fixed price from Government; he is affected only by the season, by the action of the landlord in raising the rent, and of his own middleman and the native underlings of the establishment. If they are moderate in their demands, his profit is the greater; if they are excessive, his profit is the less.

5131. Sir W. Lawson.] Is there anything debited to the opium revenue for the interest of the capital lying out in advances?—Nothing, I believe, is debited for interest, and nothing for the plant, and nothing for the stock. The opium buildings in Calcutta have been very costly.

5132. Nothing is debited, as I understand you, for the interest of the capital lying out in advances?—Not so far as I am aware.

5133. I think you have already spoken of a cess known by the name of Khurch, which is imposed by the Kattadar in the final adjustment of accounts. Is not this irregular cess imposed to prevent the subordinate agents of the Government from making false returns and false reports?—It may be, but I believe it to be the custom of the country.

5134. Have you heard of the statement made by Mr. Farquharson, an opium agent, that "The money spent in these fees is deducted by the Kattadars in their accounts with the individual cultivators, and distributed by them amongst the district Umlah. The ryot has nothing to do with the matter beyond submitting to the deduction in his accounts, which he generally does most patiently." And is that a correct statement, so far as you know?—I believe that that is correct.

5135. And, I suppose, occasionally the customary offerings are got by these officials, "frightening the cultivators, by telling them

either that their cultivation is short and they will have to be sent to the station, or that the crop has been estimated at 8 or 10 seers per beegah, when it ought strictly to have been put down at a much lower rate." Have you any knowledge of such proceedings as that?—Such proceedings can go only to a certain length, and it ought to be said that they are common to all transactions of the kind among a poor and uneducated people. The difference in the case of the monopoly is that these oppressive officials are confessedly underpaid, and are weighted with the authority of the Government.

5136. Are not the best lands used for the cultivation of the poppy?—Yes, and the native officials take care that the strength of the highly cultivated soil shall not be diminished by other exhausting crops in the same year.

5137. Is it true that in Guzerat, since the poppy has been introduced on a large scale, the people have been starving for bread?—Guzerat has suffered from high prices, like every other part of Western India, during the last eight years, but I do not know how far the introduction of the poppy has caused that. It has done so in Malwa and in Behar, that is to say, in Bengal.

5138. Is it true that in Malwa, while the zemindars are amassing fortunes, the people are wanting the necessaries of life, and that although the country is extremely fertile, grain has to be imported at exorbitant rates?—The import of grain is a necessity in Malwa at all times.

5139. Do you know whether the cultivation of the poppy was prohibited in Pegu until that province was annexed?—I believe so; it was prohibited in Aracan.

5140. It is grown now in Pegu, I suppose?—I think not, now that Pegu is one of the divisions of British Burmah.

5141. I think you said that one objection to the monopoly was, that the officials, whose business it was to grow the poppy for the Government, were not well acquainted with the business. Could you explain why, if their business is to grow the poppy for the Government, they should not understand it as well as people who are employed in any other business understand that business?—The covenanted officials of the opium department are generally men of considerable standing in the service, who are popularly believed to be unfit for any other appointment, but who, having charge of an enormous revenue, are very highly paid. The uncovenanted English officials do really understand the people and the cultivation, but have no knowledge of commercial conditions and operations.

5142. Then the objection as to these people not knowing their business is simply a general objection, which applies to all Government officials, who, I presume, are not supposed to be so active as officials employed by any private firm in any business?—Something more; they have neither the knowledge nor the self-interest of a private trader.

5143. But there is not more objection to Government action in this case than there is to any Government action; nothing beyond the objection that a Government official does not generally work so hard as a private person?—And the class of Government officials in the opium department has been, as a rule, inferior to that in the other branches of the service. The same thing used to be true of the salt manufacture, when it existed in Bengal.

5144. Did

5144. Did I rightly understand you, that some of the leading English firms declined to deal in opium, on account of the gambling and speculative nature of the business, or was that on account of the evils which they thought arose from it?—In Calcutta, with perhaps one exception, the trade is entirely in the hands of Armenians, Jews, and other Asiatics. The English firms which have had to do with the opium trade are chiefly concerned in the shipping part of it, not in the gambling.

5145. I wish to know whether you can tell us the motive which led certain firms, as you say, to decline engaging in the trade; was it because they thought it an immoral trade, or because they thought it one not desirable on other grounds to engage in; or perhaps you are not aware of their motives?—I am aware of the motives in two cases, and in both those cases the reason was the moral one.

5146. They thought that the drug was injurious?—Yes; and that the whole mode of its introduction into China, and the wars which were the consequence of that, were disgraceful to the British Government.

5147. *Chairman.*] Was that their avowed motive?—Their motive for giving up.

5148. *Mr. B. Denison.*] Is there any objection to give the name of the firm?—I could give it privately.

5149. *Sir W. Lawson.*] I think you said that the whole excise system was most unpopular among the natives?—Excessively so. The spread of drunkenness among the most wealthy and the lowest parts of the population, has, even in my time, been most marked. A good illustration of that is the old Danish settlement of Serampore. Under the Danes the maximum number of shops for the sale of liquors and drugs was four. Under the British *ahkari* system the number two years ago was 14, and it is probably larger now. The result is that natives, especially domestic servants, may be seen reeling in the streets; crime has very largely increased, and the mortality of the richer class of natives has become a byword, even among themselves.

5150. To what portions of India do your remarks principally apply?—Bengal exclusively, and the North Western Provinces.

5151. I will just read you a couple of sentences from a petition presented by the Madras Native Association some years ago, and I will ask you whether you think the statements very much exaggerated, or whether they have any foundation in truth. After describing the system on which the revenue is raised from the sale of these spirituous drinks, they say, "And as the sale price is extremely low, the quantity consumed, and the number of consumers are immense. Drunkenness, with all its miseries, is consequently common throughout the land; and its baneful effects are a full counterpoise for whatever real or imaginary benefits have been derived by the lower orders of India from her connection with Great Britain." Do you think that a gross exaggeration?—As a matter of fact, it is an exaggeration. As a matter of opinion, it represents the popular native idea on the subject. The proverb among the Bengalees is, that the British Government makes a man drunk for a pice, a pice being less than a farthing. Certainly at our *ahkari* shops, which are identified with the Government as much as the schools are identified

with it, a man may get drunk for an anna or three halfpence.

5152. *Chairman.*] Does this association of the British Government with drunkenness in the minds of the natives arise from the circumstances of drunkenness or excessive drinking having been so common among the Europeans in India?—I do not think that drinking has been in my time excessive among the Europeans in India.

5153. Do you know whether in the usual dramas that are exhibited amongst the natives, and to the natives, and by the natives, the drunken European is generally a stock character?—Such a character is common, both in the dramas and in the figures, the large clay figures which are exhibited at idolatrous festivals; but it is well understood that these represent our soldiers and sailors, and of late, the class of railway mechanics who have been introduced into the country.

5154. *Sir C. Wingfield.*] But in the paintings on the walls of native houses in Upper India, officers drinking are a common representation, are they not?—But they are not represented as totally drunk; they are simply represented as sitting at table.

5155. *Chairman.*] In the dramas is it the soldier or the officer that is generally represented as drunk?—In Bengal the loafer, as he is called, has created such terror among the timid rural population, that that I believe has given rise to the frequency with which such scenes are represented.

5156. *Sir W. Lawson.*] You think that higher duties upon these spirituous drinks, causing an increase of the price, would be popular among the native population?—So popular that the native newspapers frequently urge an increase of the duty. In a country like India, which is abstemious by creed and by climate, it seems to the intelligent native monstrous that the English Government should introduce a system for promoting the sale of intoxicating liquors and drugs, which it is so desirous to modify and check in its own country.

5157. With reference to that answer, in what way do you refer to the Government having tried to check the consumption of spirits in its own country?—I allude to the discussions in Parliament and in the English press.

5158. But you are aware that the discussions in Parliament do not always end in action on the part of the Government?—The debates are read in India.

5159. I understand you that it is the duty of the excise officials in India to raise as large a revenue as they can from the sale of these intoxicating drinks, and that they are considered excellent and good officers if they bring in a large amount, and if they do not they are looked upon with some disfavour?—Every annual report of the Bengal Board of Revenue proves that.

5160. Every effort, then, is made to induce the consumption of drink among the natives?—To this extent; recently for both moral and revenue reasons a new system of excise has been introduced, called the *Sudder* distillery system. According to that no licensed native may, as hitherto, manufacture liquor wherever he pleases, but he must do it in a few central distilleries which are strictly supervised by the excise officers. The effect of this, especially among the wild tribes of Bengal and Central India, has undoubtedly been to check the consumption of liquor,

Mr.
G. Smith,
LL.D.
—
19 May
1871.

Mr.
G. Smith,
I.L.D.
—
19 May
1871.

liquor, and that to such an extent that the Government of India relaxed their rules in order to allow the Ghonds and others to brew the sort of beer which is prepared from the mowah tree or plant. But the licensing system is the principal cause of the evil now.

5161. Do you think that if the natives, and even these people who consume so much of these drinks were allowed any option as to the establishment of these places for the sale of the drinks among them, they would wish to have them, or that they would prefer to prevent their being set down amongst them as far as you know their opinion?—Ninety-nine men out of a hundred would prevent their establishment.

5162. And you state positively that these places are entirely forced upon them by the Government?—By the officials of the excise department acting under the local boards of revenue.

5163. Do you think that the efforts of the Government to extend the sale of these drinks have produced as great evils in India as they have among our own population; that the misery and wretchedness are as great there as here?—Greater in this sense, that natives of India are habitually abstemious, and natives of northern climates have a certain natural craving for stimulants.

5164. Sir James Elphinstone.] You are aware that there is a large amount of opium smuggling in India?—In Bengal.

5165. Does it exist in other parts of the country?—It used to be so very bad through the Portuguese territory that the Malwa monopoly was abolished chiefly for that reason, and the excise system introduced.

5166. That has ceased since those regulations were put in force?—It has very largely ceased. I cannot say how far.

5167. Now, the export of opium surreptitiously from Damaun is at an end?—Practically I believe so.

5168. But there is still a quantity of opium smuggled out of Malwa, is there not?—I was told not.

5169. Is there any Malwa opium smuggled down into Bengal?—I think not; but the railway system has given great facilities to the smuggling of opium in small quantities so that the trade is busily carried on in the Calcutta Bazaar by Asiatics who send up agents to the opium districts to purchase the surplus crude opium which the cultivators keep back from the officials.

5170. Then, too, the form in which the opium is packed, the ball system, makes it particularly easy to carry on the operation of smuggling, does it not?—Opium is made into balls only in the factory. The form in which it is smuggled is the crude form, and it may assume all shapes; practically it looks like unformed pitch. It is generally wrapped in the waistbands and clothing of the native smugglers who come down as third-class passengers from Behar, and occasionally when they have a large venture they use boats covered with onions, as I said before.

5171. You are aware, perhaps, that there is a very large excess of opium which goes on to China beyond what is accounted for in the Government sales?—Yes, I was aware of that.

5172. That is supposed to be so in the Straits, is it not?—Yes.

5173. Taking the amount of opium to be in

round numbers about 90,000 chests, would you be surprised if you heard that there were 10,000 chests that passed through the Straits that were unaccounted for?—I should think that the quantity was less.

5174. The amount which arrives in China is very considerably over the amount that passes through the Government hands?—Yes.

5175. Can you state what is the acreage of land under opium cultivation in Bengal and in Malwa?—Up to five years ago the maximum acreage, as fixed by the Bengal Government for both Behar and Benares, was 750,000 beegahs.

5176. And in Malwa what is the extent?—I do not know.

5177. Guzerat is growing a good deal of opium now, is it not?—A good deal.

5178. But then the opium is always grown upon dry land, is it not?—In Bengal it is so.

5179. And also in Malwa?—I have heard so.

5180. And they are obliged to bring it to a very high state of cultivation before it will produce opium?—It takes three years to bring it to the proper state.

5181. But if it was subject to the ordinary rotation of cropping of such land, it would not receive that manure, I fancy, would it?—The ryots could not afford to give it such high cultivation.

5182. And therefore the amount of the low-class grain which it would grow if it was not put through that high system of cultivation would not be very appreciable as an adjunct to the food-growing capacity of the country in relation to the enormous population?—Not at once, but ultimately it would be so. For instance, if Malwa had grown its own food during the late famine in Rajpootana, instead of importing it, thousands of lives would have been saved.

5183. But to have enabled Malwa to do that, it must have been under a totally different system of cultivation from that which it is practicable to carry out there; there is not water in Malwa to produce grain, is there, for the inhabitants?—Malwa has a very fair share of the periodical rains, compared with the desert parts of Rajpootana.

5184. Mr. Bourke.] Did not such corn crops as there were fail in Malwa that year?—I think not altogether.

5185. Sir J. Elphinstone.] Is it not the case that the land is of that dry description in Malwa, that if it was not applied to the high class cultivation of opium the resources of the country would not only suffer very materially, but the land would not produce the food for the inhabitants which they are enabled to purchase from adopting the high-class cultivation?—I think that if the poppy were removed, the land would be as favourable for the growth of grain as other portions of the country.

5186. With regard to Pegu, there never was any opium grown there, was there?—Not under the native government.

5187. But the climate of Pegu is not a climate that you can grow opium in with any advantage?—It is much too moist. The opium consumed there is Bengal opium imported by the abkari department, and, as I said before, originally, at least, it was forced upon the people, but now it is very popular among the Indo-Chinese and the inhabitants of the ports.

5188. What do you mean by "forced on the people;" were they obliged to take it?—I have quoted

quoted from Sir Arthur Phayre and Mr. Wheeler official statements, showing how the Bengalee underlings of the department have given away cakes of opium in order to create a taste for the drug; that was in Aracan.

5189. If the opium trade was thrown open, and the Government were to divest themselves entirely of the responsibility of growing opium, there would be no difficulty, would there, in obtaining the necessary advances for the cultivation in the same way as with indigo and sugar?—I should fancy there would be no difficulty. The number of private capitalists who have no scruples as to trade would probably be so large that self-interest would induce them to enter into it.

5190. So that in point of fact the trade would go on probably more extensively under another name?—It should not go on more extensively, because we assume that the Government would restrict the cultivation, especially in the time of transition from the one system to the other, to certain districts.

5191. But on what ground of political economy would the Government be justified in restricting a profitable cultivation?—It would be a cultivation entirely with a view to manufacture; and the Government would restrict it on the same grounds as those on which they impose a very high duty on the manufacture of liquor—grounds of public advantage, and also of finance.

5192. But if they threw the trade open, they would levy their duties for fiscal purposes, but they could not, in conformity with the laws of political economy, restrict the people from growing opium if they chose, could they?—At first, in passing from their own system to the excise system, say, in one district, it would be necessary for them to do so, but ultimately the trade would adapt itself like all other trades, and up to a point Government interference would not be necessary.

5193. There is no lack of demand in China, is there?—If anything, the demand seems to be slackening.

5194. *Chairman.*] Do we rightly understand you to say that the Government is to restrict the extent or the area of cultivation under the excise system; or that the area of cultivation within certain provinces is to be unlimited?—At first, in order not to affect the large revenue from the Bengal monopoly, it would be necessary to introduce the excise system into only a small area, from which the Government would retire; and there, until the Government had entirely retired from the monopoly, it would be necessary to restrict the area; but Government having retired, the law of supply and demand would probably so operate that the trade might be left to itself.

5195. As a permanent system, you would not propose that the Government should restrict the area of cultivation, even if they kept it within certain provinces?—Not up to a point.

5196. Supposing the excise system were introduced, would not the self-interest of the traders, cultivators, and merchants, if the business was profitable, lead them to a very considerable, and even rash, extension of the cultivation?—At first, it would be necessary to restrict the area of cultivation until the excise system was fully introduced. Then any sudden expansion, dictated by self-interest, would be checked by the results of such rashness. Ultimately, if it were found that the trade was enormously increased, it would be the duty of the paternal Government of a country to which the laws of political economy do

0.59.

not apply, to check the cultivation for the public interest.

5197. *Sir J. Elphinstone.*] But if it was increased unduly, it would bring down the price naturally in the China market?—As between the Government official and the trader the trader knows his own business best, and the risk would be less under him than under Government.

5198. But in a cultivation which requires three years to bring it to maturity the prospect of a high market in China might lead the cultivator to a very large expansion of the land prepared for growing opium, and, in the event of that expansion producing low prices, would it not have a tendency to throw a very large portion of that land out of cultivation, and to produce a rebound?—That would be the tendency; but it is so with cotton now.

5199. Yes; but cotton does not pay a large excise duty. Consequently, throwing a large amount of your opium lands, highly prepared for the purpose, out of cultivation, would most seriously affect the public revenue, would it not?—In the long run it would not do so, because the private trader is affected by self-interest to an extent which is not felt by the Government officials.

5200. But at the outset it might produce very great commercial convulsions and damage to the revenue, might it not?—Not if the transition from the one system to the other were made gradually and experimentally. No such convulsion was produced when the monopoly was abolished in Malwa.

5201. But in Malwa the cultivation is strictly under the supervision of the Government, is it not?—Not at all in the same sense in which it is in Bengal.

5202. Then the amount of land which is capable of this cultivation is more restricted than it is in Bengal?—Yes, if you look at Malwa proper, but not so if you take the states of Rajpootana as well as those of Central India into account.

5203. With regard to liquor, what is the amount of duty on arrack in Bengal?—I have failed to find that at present.

5204. Are there any precautions used in the distillery to purify the spirit and to expel the poisonous elements which exist in Indian liquor?—Precautions very similar to those adopted in this country, since the introduction of the Sudder distillery system.

5205. The Sudder distillery is the large still?—Two or three large stills in a county.

5206. The whole of the spirits are now distilled there?—Yes.

5207. And does the process of rectification go on there?—I have personally only observed the spirits being tested as to proof, but not as to purity. In the Central Provinces in 1868, the still head duty of country spirits was 1 s. 6 d. a gallon on liquor, not stronger than 70 below London proof; 3 s. 6 d. up to 40 below proof, and 5 s. above that.

5208. So that those in point of fact are the duties?—The duties on country spirits in the Central Provinces; they may be higher in other provinces.

5209. That spirit is very largely adulterated, is it not, before it is brought into use?—By the retail dealer.

5210. Is there any law or police regulation which takes cognisance of adulteration?—None; the

Mr.

1871.

Mr.
G. Smith,
LL.D.
—
19 May
1871.

the public of India have long asked for a law to prevent the free sale of poisons, and that ought to include the adulteration of liquor.

5211. You are aware, I suppose, that the deleterious effects of Indian liquor are very much from the adulterative substances that are introduced into it?—That was so until the Sudder distillery system was established. It is so now, so far as I know; only in the large presidency towns, where rejected English liquors are largely bought and drugged for the consumption both of natives and the lower class of Europeans.

5212. Most of the dysentery in its worst form and other diseases of that description are produced, are they not, by the consumption of deleterious liquors?—In the case of the lower class of Europeans, certainly.

5213. The liquor containing poisons which were added to it by the adulterator?—Quite so; in order to create thirst.

5214. The manufacture of arrack existed in India, did it not, when we first became acquainted with the country?—It did; but the consumption must have been trifling, so far as we know.

5215. We have it in evidence, that the consumption on the coasts of Gujerat, Kattawar, and the Concan, and all those districts among the seafaring population, has always been considerable?—They are but small communities compared with the millions of Hindus and Mahometans, who believe themselves to be forbidden the indulgence by their sacred books and by the custom of the country.

5216. The liquor, I suppose, is produced either from the toddy, the juice of the date, or from the palmyra, or from the sugar cane, is it not?—From those, and from certain jungle plants or fruits, such as the mowah, which produces a weak kind of spirit, much indulged in by the Hill tribes.

5217. Is it a deleterious spirit when partaken of to excess?—When partaken of to excess, it leads to violence.

5218. Then the methylic element predominates probably in it?—I believe so.

5219. The other poisonous element which acts upon the bowels is more present in the liquor distilled from the palm and the sugar-cane, is it not?—So I believe.

5220. Now, supposing that the manufacture of liquor was entirely put a stop to in the Bengal Presidency (with which you are best acquainted), would the commercial value of the products from which it is made be very much deteriorated; would they not have the manufacture of sugar to fall back upon?—The deterioration in value would be to a very slight extent: the consumption of sugar has of late become so comparatively large, that it has now to be imported into India, especially into such provinces as Bombay.

5221. And I believe a very large portion of the produce of sugar from the Mauritius is imported into Bombay, is it not?—I believe so.

5222. So that it would not be ruin or distress to any trade if the manufacture of spirits was either abolished or very materially restricted?—So far from that, within my own knowledge the large export of Bengal rum to Australia has entirely ceased, because it is found more profitable to sell the sugar in its natural state.

5223. Mr. Hermon.] You were saying that it would be popular with the natives that the

duty on spirits should be increased?—I believe so.

5224. Would it be equally popular to increase the duty on home-made spirits as well as on imported spirits?—It would be unfair to increase the duty on all imported spirits, because that was doubled by Lord Canning in 1859, and the consumption is so generally confined to Europeans, that it would amount to a special and severe tax upon them.

5225. Then the proposition that you say would be so favourable to the natives would be to increase the duty upon the home-made spirits?—Yes.

5226. With regard to opium; if the culture of Patna or Bengal opium were placed on the same footing as that of Malwa, would it tend to increase the consumption of the Bengal opium, and to decrease that of Malwa?—I should say, to decrease the Bengal opium; at least that is the belief of all in Bombay who have studied the question; but it is impossible to say.

5227. I understood you to say that there was a great deal of opium smuggled, and that to avoid its being detected the boat loads were covered with onions; afterwards you told us that a great deal was smuggled in the clothes of people coming down by third-class conveyance, and so forth; would not the smell be easily detected in the latter case?—No one would believe that who had seen a third-class carriage in Bengal for nine months of the year; there are other smells sufficient to check the pungency of the opium.

5228. Mr. J. B. Smith.] Was there any abkari tax under the Native Government?—Certainly; under the Mussulman Government, so far as I have read, the tax on drugs was farmed out to contractors, but the consumption was very small, except in the later years of Akbar's administration.

5229. They made it a source of revenue?—The Emperor for the time being did so, and his various Lieutenant Governors.

5230. Was his the only Government that established an abkari?—I am not aware of any of the old Hindoo Governments having done so. I have never read that they did. It is most unlikely, considering that the laws of Manu certainly forbid all Hindus of respectable castes to touch intoxicating liquor; and the Brahmins have continually taught the same.

5231. Nevertheless, they do consume them to a very large extent?—The wild tribes and lower castes do to a large extent, and those who have come more into contact with Europeans, as servants and employes.

5232. I see that in 1870-71 the abkari produced altogether to the Government 2,300,000 L.?—I have an official return, showing the growth of the abkari revenue in all India from 1861-62, which is the year when Lord Canning's and Mr. Wilson's new tariff arrangements first began to tell, up to the year 1868-69. It has risen from 1,786,158 L. to 2,360,000 L.

5233. Now would you propose to abolish the abkari altogether?—On the contrary; if a much more heavy rate were laid upon all country-made spirits, and the licensing system were checked by the vast majority of the people who are opposed to the consumption of spirits, no doubt the consumption would fall off; but practically the revenue would be the same, from the increased rates of duty. The argument that an increased

increased excise revenue is always a sign of the growing prosperity of a people utterly fails when applied to a population like that of India, which, as I have said before, is abstemious by creed and by climate.

5234. Then you think that raising the duty would have little effect upon the consumption of spirits?—Raising the duty would, I should guess, as much restrict the consumption as it made up for the loss of revenue, so that the revenue would practically remain as it is.

5235. Have you any grounds for that expectation?—Merely residence, experience of native society, and watching the annual progress of the revenue and of the department.

5236. Supposing it should very seriously affect the revenue, what do you propose to substitute for it, that revenue being necessary to the Government?—I would substitute a tobacco tax, which, in the form of a duty exacted from licensed manufactories, might be levied by the present excise department without any serious increase of expenditure.

5237. Do you think that a tax on tobacco would be considered oppressive by the Indians?—I think it would. I think that the tendency of any increase of taxation should not be in the direction of the mass of the people, for political as well as financial reasons, but in the direction of causing the richer and trading classes to contribute their full share.

5238. Your reason for suggesting that tax on tobacco is that it would extend to all and not fall particularly on the lower classes?—If you assume that the excise revenue would fall off because the high duty would check consumption, which I do not believe, then it would not be so objectionable to supply the loss of revenue by a tobacco tax; but absolutely it would be better to raise increased taxation from any class of the people rather than from the mass of the people who at present pay the greater proportion of the taxation.

5239. Did I rightly understand you to advocate the abolition of the growth of opium?—That would be impossible and unfair. I merely advocate its restriction.

5240. What you simply want is, that the same course should be pursued in Bengal as is now pursued in Malwa?—Yes, nothing more.

5241. Mr. Lyttelton.] You say that the great mass of the population at present pays the greater part of the taxation?—I think so.

5242. In what way, except by means of the salt tax can that be shown to be the case?—That brings up the question of the land revenue; how much of that is rent, and how much is taxation, or is all of it rent or is all of it taxation.

5243. You allude to that solely?—To that chiefly. They also pay a very considerable proportion of the customs duties. The difference between a poor man and a rich man in India as a taxpayer is excessively trifling. They eat alike, they dress almost alike; the consumption, in fact, is very much the same; so that the possessor of enormous wealth practically, at this moment, unless through direct taxation, such as income tax, pays as little to the Government as almost the meanest of his servants.

5244. On what articles do the poorest of the population pay customs duties?—On their cloth, so far as it is Manchester cloth, their salt, and their drink, of which they certainly consume more than the respectable classes.

O.59.

5245. Do not the poorest classes wear home-spun clothes exclusively?—The proportion has been often discussed. I believe the truth to be that the very poorest classes do wear home-spun cloth; but the mass of the respectable class of agriculturists have their holiday suit of English cloth and their ordinary labouring suit which they use in the fields, of home-spun cloth. Practically, in the large cities and along the lines of railway, nothing but English cloth is used.

5246. You admit, I suppose, that your statement with regard to the poorer classes bearing this amount of taxation is contradicted by high authorities?—It is a matter of calculation. As one who has lived many years in Bengal and paid taxes, I have always felt that personally, until the income tax was imposed, I paid less to the Government than my servants, except in the consumption of imported English articles.

5247. You consider that the argument in favour of a salt tax that it is a good tax, because in no other way can you reach the mass of the people, is an unsound one?—The richer people do not pay taxes proportionately to the mass of the lower classes.

5248. We were told by one witness that the great proportion of people paid no taxes, other than the salt tax: that is not your view?—They pay customs, excise, and salt in the same proportion as the richer natives.

5249. In regard to raising the duty on spirits, of course there must be a point where the increased duty would check consumption; where would that point be, in your opinion?—I have not had experience enough to say.

5250. Roughly, could you say?—Roughly, I should say that double the present duty would be popular, and would not lead to smuggling, because the population is on our side, and not, as in this country, against us in such a matter as that.

5251. Do you expect a decreased export of opium under an excise system?—That would depend upon China. The advantage of that system would be, that it would respond most accurately to the demand in China; so that the Government would be able to calculate upon a fixed or almost fixed income from opium, in a way which it cannot do at present.

5252. But if China asked for more, under that system she would get more?—Yes.

5253. Can you point out what difference, morally, there would be between the two systems, the monopoly system and the excise system, which resulted in the same amount of production of a noxious plant, assuming it to be noxious?—Morally, the responsibility lies upon Government, as Government, at present; that is to say, upon this country. By the excise system it rests entirely on the individuals who may engage in the trade, and Government is put in its proper position of exacting the highest possible duty from what is admitted to be a noxious production.

5254. Assuming it to be a noxious production, surely, in a country like India, where you say the laws of political economy are not strictly applicable, but the Government is of a highly paternal character, it is the duty of the Government to prohibit the growth of the drug altogether?—I think not. In the first place, that would be impossible. We are a few white officials governing millions of people. In the second place, it would be unfair, for you are
arguing

Mr.
G. Smith
LL.D.

1871.

Mr.
G. Smith,
LL.D.
—
19 May
1871.

arguing from the abuse of what is in itself not only innocent, but advantageous, medicinally.

5255. To return to the two systems, I do not see myself what difference there can be between a Government monopoly which produces so many chests of opium per annum, and an excise system set on foot by the Government itself, which will produce probably a great deal more; do not you imagine that Government is equally responsible in a country like India under either of those systems?—I think not; the position of the Government is utterly different in the two cases. In the present case, not only in the eyes of the natives, but as a matter of fact, the Government is the poppy grower, the poppy manufacturer, and the opium seller at the auction. In the other case it would say, "We shall interfere with the growth of the poppy no more than with the growth of tobacco; after a time, that is; but we shall take care that if people will grow the poppy, and manufacture opium from it, they shall pay the very highest duty we can exact without causing smuggling." I think that the position is a very different one in the two cases. It certainly is considered so by the natives, and would be so considered, I think, by most men in this country.

5256. Do you regard opium as to the same extent a necessary of life as spirits are in England?—Not for India. I do not think that opium is popular with large classes of people in India; there is good proof of that. The system which prevails in the Punjab is an acreage tax; the cultivation is free; no one checks it, no one supervises it, but the cultivator pays to the land revenue some 3 or 4 rupees an acre more than he would pay were the land given up to food crops. The result is, that the consumption of opium, though considerable among certain classes of the Sikhs and Mahometans, has not on the whole demoralised the population of the Punjab.

5257. You said, speaking of the evils of the monopoly system, that the Government monopoly is as bad in India as a similar system would be in England, namely, the Chancellor of the Exchequer making the sale of spirits and beer a Government monopoly; but supposing that the result of the establishment of such a system in England would be to diminish the consumption of spirits and beer by one-half, would you have any objection to it on moral grounds?—No; but the cases are not parallel. The Government in India exports its opium to China, and washes its hands of the responsibility there. In this case the Government wishes to save its own subjects from demoralisation.

5258. You make a clear distinction between demoralising foreigners, and demoralising our own subjects?—The Government of India does. The Government of India has always, so far as the public know, taken a purely revenue view of the whole monopoly.

5259. I quite understand that: you have been taking that view too, but you have also been taking the moral view?—The Government of India would not consider the moral view; it would say that it checks the consumption of opium in India, by putting a high duty on it. I think the duty might be higher; but as to China, the whole history of our connection with that country shows the view taken both by the Government of India and by the Government of this country.

5260. Mr. Cave.] Does it not check the consumption in China just as much by imposing a duty on it in India?—Not where the article is a fancy article, such as Indian opium is.

5261. But if there were no duty in India, it would be much cheaper in China?—Yes; but the check does not tell to that extent; that is to say, the demand in China for opium is so very great, that the Indian supply meets it only to a certain extent.

5262. Mr. Eastwick.] I think you said that the area of cultivation of opium in Bengal is 750,000 beegahs?—It was so some years ago; it is now much larger.

5263. What would you put it at now?—Certainly 850,000 beegahs.

5264. Taking it that that would represent about half-a-million of acres, what proportion would that bear to the general cultivated area?—It is impossible to tell that in Bengal, for the permanent settlement prevents the collection of such agricultural statistics as we are now getting from provinces where the land revenue settlement is periodical.

5265. Could you tell us what it is in Benares?—Not in the permanently settled districts of Benares.

5266. Or in Malwa?—That is a native state.

5267. That half a million of acres would be rather a small per-centage of the whole cultivated area, would it not?—Rather small.

5268. Do you think that if this opium cultivation were entirely done away, it could have much effect in preventing famine; do you think that it is of sufficient importance?—As a matter of fact, the opium cultivation has intensified famines in those parts of the opium districts which have no railways and few roads, such as the districts to the north of the Ganges.

5269. But would not the same thing also apply to tea cultivation, or to indigo cultivation, or to cotton cultivation, if it is an argument against opium cultivation that it supplants cereals?—Supposing that Government kept an expensive establishment purposely to force cotton, or tea, or indigo into cultivation, it would.

5270. But that expensive establishment is paid for by the profits of the opium trade, and therefore the population are so far benefiting to an immense extent, because they are paid, in fact, by the foreigner?—They are benefiting; the cultivation is popular, because it pays under the present prices; but they would benefit more under an excise system.

5271. If the opium cultivation monopoly were done away with, we should lose all our plant; it would be sacrificed, of course?—No; it would certainly be taken over in the same way as our large silk filatures and indigo factories were taken over by European and native capitalists when the East India Company was deprived of its trade.

5272. Sir C. Wingfield.] At a tremendous sacrifice?—At a tremendous sacrifice then; but the competition in this case would be much more considerable than it was then.

5273. Mr. Eastwick.] Still, have you any reason to suppose that the cultivators would be as prosperous and as well treated under native speculators or European speculators as they are under the Government?—I should think so.

5274. Do you find that to be the case with regard to the indigo cultivators?—It depends on what indigo cultivators are meant. The indigo cultivators, were, no doubt in Nuddea to some extent

rent badly treated, but that was simply because the planters continued the system which they had received from the East India Company. My impression is, that the cultivators would be better treated, because at present they hardly dare to resist the illegal practices of Government servants, while they would certainly resist them were native underlings simply the paid employés of private capitalists.

5275. But we have very strong evidence, have we not, that they have been an extremely prosperous class of the population?—The middle men among them.

5276. But also of the cultivators?—That is not my experience, as contrasting them with the ordinary cultivator; such a very large proportion of the profits goes to the zemindar in increased rent, and to the middlemen and the native officials of the department.

5277. Then you would state decidedly that you do not consider them to be as compared with the other cultivating classes a very prosperous class?—Certainly.

5278. When you were at Indore, did you examine into the circumstances of the opium cultivators there?—To some extent.

5279. And what condition did you find them in?—Very much the same as in Patna; but I was under the disadvantage of not knowing their language.

5280. Did you find them equally prosperous with the opium cultivators of Bengal?—They seemed to be so.

5281. More so, should you say?—I should not say more so, and since that time their rent has been very considerably raised by Holkar.

5282. So far, that would not be very encouraging, then, to do away with the monopoly, because, though it is free cultivation in Malwa, the cultivators are not more prosperous, at all events, and perhaps less so, than in Bengal?—No: but the argument from Holkar's raising the rent would apply also to Bengal. It is stated distinctly, that although the law forbids the zemindar to raise the rent of the poppy cultivators, the violation of the law is winked at.

5283. Your great objection to the monopoly is, is it not, that opium does demoralise the population of China; if it was not for that, if there was no demoralisation, you would not object to it?—From a moral point of view, that is one objection; but my main argument would be from the financial point of view, that by bringing the cultivation of opium within the ordinary laws of trade, you would give a comparative certainty to the revenue derived from it, which it can never possess under the system of monopoly.

5284. I will take the moral consideration first, and if I could show you a considerable population who are in the habit of taking opium, and who are as healthy as any population, and if I could show that the Chinese population are unhealthy, simply because they use the opium in one particular way, that would take away very much from the force of that moral consideration, would it not?—These are questions of fact, of course.

5285. It is the fact, is it not, that it is the smoking of opium which is so injurious, and not the eating of opium?—I believe so, and I believe the abuses that arise from the consumption of opium in China have been very considerably exaggerated.

5286. You think that the smuggling would not
0.59.

be so extensive under the licensing system as it is under the monopoly system?—I think that, as a matter of fact, the abolition of the monopoly in Malwa stopped the smuggling, and the Assistant Resident at Indore, whose special duty it was to receive the pass fees, assured me, that so far as our Government knew, there was no smuggling of Malwa opium.

5287. Mr. B. Denison.] Are the Committee to understand from your evidence, that the system pursued at Bombay is not open to objection as contra-distinguished from the system pursued in Bengal?—No, but that the system of Bengal has special objections to which the Malwa system is not open.

5288. I did not hear whether you pointed out any particular objections as connected with the Malwa opium trade?—I have already answered that.

5289. In your opinion, if the licensing system were adopted as proposed by you in Bengal, would the acreage under opium cultivation increase, diminish, or remain stationary?—I think it would remain stationary from the restriction put upon it by the Government, during the time of transition, but afterwards it would fluctuate according to the laws of trade, unless it should assume so great a proportion that it would be the duty of Government in the public interests to restrict it permanently.

5290. The advance for the opium cultivation amounting to from a million and a half to a million and three quarters is practically a perpetual advance, is it not?—Practically, the same cultivator remains on the books, and his children after him, unless he deliberately demands to be allowed to give up the cultivation.

5291. Therefore it would not be correct to say that it is a perpetual advance of this large sum of money without interest to the cultivating class of the community?—I think it so.

5292. And do you think that that large amount of capital would be speedily replaced by private traders?—It would be their interest to replace it. A similar amount of capital, if not larger, was advanced in the indigo districts before 1860.

5293. You have told the Committee that the chief persons concerned in the opium trade were Armenians, Jews, and Asiatics, and that there are scarcely any Europeans at all engaged in it?—Yes.

5294. And I think you said that in some instances that arose from moral considerations?—I mentioned that I knew of two instances of that kind.

5295. But are there not two other reasons that worked, one being the large amount of capital involved in the trade, and the second the great amount of gambling and speculation which goes on in connection with it?—I have no doubt that that would weigh with many.

5296. Are you under the impression that gambling at the opium sales goes on at the present day to the same extent as it did formerly?—Quite as much; not only at the sale on the part of actual capitalists, but in the bazaars on the part of an inferior order of pure speculators.

5297. But, knowing what you do of Asiatics, knowing what innate gamblers they are, do you believe that the mere accident of these opium sales supplies them with the means of gambling which they would not find in other ways?—They would probably find it in other ways, but it is a
great

great source of gambling, the greatest certainly in Calcutta.

5298. But probably not more than what may be found on the London Stock Exchange, as regards speculations in all kinds of stocks?—Certainly not more than I witnessed in Bombay in December 1864, among all classes of natives.

5299. You said, talking of the excise on spirits, that it was unpopular, that drunkenness was greatly on the increase, also crime and mortality amongst the richer natives, and, I think, you proposed a substitute for the possible loss of revenue arising from an increase on spirit duties, a tobacco tax to supplement the revenue?—If there were such a loss.

5300. Do you happen to know that a tobacco tax was in contemplation some years ago?—A tobacco tax was proposed by Mr. Wilson in 1860. His proposals were submitted to the local governments, and probably they would have been adopted, but that in Mr. Laing's time the large opium revenue temporarily tided us over our financial difficulties.

5301. Speaking of Mr. Laing's proposal, was that to have been a license tax on the sale of tobacco?—The proposal was an import duty of, I think, eight annas a seer, i.e. the 2 lbs.; and an equivalent duty on home-grown tobacco; but it was never fully decided whether the home duty should be raised from the cultivator or from licensed traders in shops, or by converting the tobacco trade into a monopoly like that of opium.

5302. Was not the proposition which found most favour that of having licensed traders?—It was.

5303. And was not the main reason why it was given up the well-ascertained fact, that the amount of revenue realised from such a source would be practically of no amount?—It would be to a large extent absorbed by the expense of collection.

5304. Then the tax which you have in contemplation would be realised, how?—In the same way as the liquor tax is now realised, from a few centres in each large district. To the same centres might be attached a tobacco department, and the excise officials, with a slight increase of establishment, might levy the tax at the same place at which they levy the liquor duty.

5305. Do you consider tobacco a necessary for the natives of India, or a luxury?—A necessary, I should say, on medical grounds. I have been told that it supplies, like the betel-nut, an element which is supplied to us by animal food.

5306. And drink, I think, you said you looked upon as a luxury?—As a luxury, forbidden by the sacred books of both the Hindoos and the Mahomedans.

5307. Then I suppose that you would not be in favour of any tax upon tobacco which would practically limit its consumption?—No, not any more than on salt.

5308. *Chairman.* Do you contemplate the growth of tobacco by the public generally, by that means?—No, simply that all tobacco wherever grown, should be compulsorily sold to licensed traders by the cultivator; and at the centres of sale the present excise officials should levy the duty imposed by Government.

5309. How would you fix the price?—It would be a free arrangement between the licensed trader and the cultivator.

5310. But if one man has compulsorily to sell to another, how is that operation to be carried on

unless somebody fixes the price?—It would be necessary to restrict the sale to certain centres, merely as a matter of organisation.

5311. But if a man is compelled to sell to any person, how can you carry out the operation unless you fix a price; how could a man be compelled to sell unless somebody is compelled to buy and give him a price?—That, of course, would be a difficulty.

5312. But I want to know how you would get over it?—Of course, under the opium monopoly system, the price is fixed; so that, undoubtedly, it would run into a monopoly.

5313. It would end in being a restricted cultivation, for the purpose of raising the revenue?—Practically, that would be the result.

5314. *Mr. Cave.* How would an acreage tax do, like the tax in Germany on tobacco?—It would do in all parts of the country, except those that are permanently settled; it would be impossible there to discover the amount of tobacco in the fields unless by an expensive system of espionage, which would absorb the revenue.

5315. Is there no calculation as to the crops in those districts now?—No more than there is in this country, except where the landlords voluntarily submit statistics, which is the case in some districts where there are intelligent Europeans.

5316. *Mr. Grant Duff.* Supposing that you could quite eliminate moral considerations from your mind, am I to understand that you would still advocate a change from the Bengal opium system for purely financial reasons?—From purely financial reasons.

5317. And I understand that you would double the excise duties all round?—Nearly so; that would be a question for the members of the department who have had experience.

5318. And when you had carried out these two arrangements, would you ensure the Government as good a revenue as it has now one year with another?—As to the excise, it would be a matter of gradual increase; no Government would suddenly double the duty in that way. I merely mention that as the maximum, and that would be popular. And as to the other, that also would be done gradually.

5319. For instance, 10 years hence, would you ensure the Government having as good a revenue as its average revenue during the last 10 years?—I would certainly ensure its having a fixed revenue much less precarious than at present.

5320. But not so large as at present?—Yes; 10 years hence I should say it would be as large. The tendency of the opium revenue is not only to be precarious, but also to fall; and I see no means of arresting its fall better than leaving the whole trade and manufacture to the ordinary laws of trade.

5321. I understand that you contemplate that the opium revenue is quite sure to be less in the next decade than it was in the last; whether we keep our present arrangements, or make a new one, it is fated to decline, you think?—I should think so.

5322. As to a tobacco tax; would not a tobacco tax, such as you suggest, be extremely unpopular?—All new taxation is unpopular, and especially if it is placed on the upper classes. If it is placed on the lower classes it is not only unpopular but it is dangerous, because we have no means of knowing the opinion of the lower classes, and it is the interest of the upper classes to hush that opinion wherever it is heard.

5323. Would

5323. Would not a tobacco tax hit the very class which now pays the salt duty?—It would, and therefore it is objectionable.

5324. I thought you recommended it?—Only as the lesser of two evils. I would rather have a tobacco tax than keep the abkari on its present system of low duties and unchecked licensing.

5325. Sir C. Wingfield.] I believe that according to your plan of excise, the growers of opium would have to take their opium to certain factories where the dealers would buy it of them?—Yes.

5326. How could you provide that the growers should take the opium to the dealers at these factories; how could you prevent the growers from surreptitiously selling it?—The risk would be less under that system than under the present system. The self-interest of the dealer would see to that.

5327. But how could the dealer watch over the private transactions of hundreds of ryots spread about the district?—The present system is that the Government official says, that a certain area of poppy ought to yield a certain proportion of crude opium. My argument is that the skilled dealer actuated also by self-interest, would know better than any Government official what proportion of opium year after year the same area ought to yield.

5328. But then what penalty could he apply; if a powerful Government cannot check it, how is a mere dealer to be able to check the surreptitious sale?—He would apply no penalty; it would be left to the Government excise department which prevents smuggling; but he applies a preventive process by taking more out of the cultivator than the Government officials now do.

5329. But why should a private dealer be able to calculate more accurately the yield of opium from each cultivator's land, than a class of officials who have passed all their lives in carrying out the opium system?—For two reasons. These officials have no self-interest in the matter; that works unconsciously. The dealer would be a skilled person, and the same result would probably follow, which we have seen in indigo. The moment that the cultivation and manufacture of indigo passed out of the hands of the highly-paid civilians, who worked it for the East India Company, into those of adventurers who made a living by it, the quality improved and the quantity largely increased.

5330. You are, perhaps, aware that in the first year after the annexation of Oude, the plan followed was to give certain persons a contract from Government to sell opium, and to cause the cultivators of opium to deliver all their opium to these licensed traders; now, is not that very much the system of excise that you propose, to give permission to a certain class of people to sell opium, and to require the growers of opium to sell to those people only?—That appears to have been an approach to it.

5331. Are you aware that that system broke down utterly from this cause, that the licensed vendors on the part of the Government could not compel the growers to deliver the opium to them, and could not prevent private and surreptitious sale in the villages?—Was the opium a new cultivation in Oude.

5332. No, it had gone on from time immemorial, but that was the difficulty found; there were no means of compelling the grower to deliver it to the licensed dealer?—The whole ex-

0.59.

perience of Malwa is opposed to that, and I ascribe the failure in Oude to the fact of the proximity of the monopoly in the North West Provinces. In Malwa there is no difficulty of the kind, the whole question is one of price. •

5333. But where the monopoly prevails, there the grower must bring his opium to the Government factories, and all surreptitious sale is prohibited; but yet you think a great deal is carried on?—Simply because the interest of the Government officials in the cultivation is not so great as that of private traders would be.

5334. But in this case which I have mentioned in Oude these people who paid a sum to Government for the special privilege of vending opium had a great interest in preventing the cultivator from disposing of it to anybody but themselves, and yet they were not able to prevent it?—Mr. H. C. Hamilton officially states that the Benares agency paid them better than the dealers in Oudh.

5335. You said that another objection to the present system was that such a delicate operation of trade is conducted by officials; but surely the trade is conducted by the purchasers at the auction sales in Calcutta; the officials do not attempt to regulate or conduct trade; they simply supply the market with a certain amount of opium?—Nine-tenths of the trade proper is conducted by officials; they make the advances, they influence the selection of the soil; they manufacture the opium under their own chemical officers in their own factories, they sell it by auction themselves, and they fix the duty. After that, of course the trade lies in the hands of the shipper. The price at which the opium sells in Calcutta is, to some extent, fixed by the considerations of the out-turn in Malwa.

5336. I thought it was the other way; that the duty on Malwa opium was fixed very much with reference to the price that could be obtained at the Calcutta sales; it is rather the price that the Bengal opium sells for that has determined the duty on Malwa opium, not the duty on Malwa opium that governs the prices obtaining at the sales at Calcutta, is it not?—Of course the prices in Calcutta fluctuate very much, much more than those in Bombay, for that reason.

5337. You also said that the interference of the opium establishment with the cultivators, and the exactions of the officers were felt as oppressive by the people?—Yes.

5338. But still the fact remains that the cultivation is popular and beneficial in the districts?—The fact remains, but the people do not like the interference, and the popularity of the cultivation and the profit of the cultivation I believe to be much more with the middlemen than with the actual persons who cultivate the poppy.

5339. The opium middlemen you mean?—Yes.

5340. You said that shortly after the annexation of Oude the people at first refused to take advances from the opium agents?—Yes.

5341. But have you heard the explanation of this refusal which was not that the cultivators themselves were at all unwilling to take advances, but that their landlords interfered and prohibited them from growing the poppy because it tended to make the cultivators independent of the landlords?—That is one probable explanation.

5342. And then when you say that the officials could practically force reluctant cultivators to grow opium, surely the cultivators knew that the collector of the district would protect them from any interference, or any oppression by opium officials,

Mr.
G. Smith,

1871.

officials, and the collector is the man that they look up to and fear, and as long as they have him on their side they care nothing for an opium agent?—The class that you speak of are ignorant and timid men, who are far removed from the collector.

5343. But there is one thing that the most timid agriculturist knows in India, and that is, that the collector is king, and that nobody can stand against him?—That is not the case to the same extent in Bengal as in the Upper Provinces; moreover, it is everywhere difficult for the poor cultivator to reach the collector, he has to pass through so many grades of natives, and to go such distances.

5344. But every deputy collector also is armed with the powers of the collector subordinately to him; he is, as regards the cultivator, as good as the collector?—As a matter of fact, my experience is, that the collector and the deputy collector, and the whole officials of a district would lend the weight of their influence to the promotion of both the opium revenue and the excise revenue.

5345. You said that the system of excise which you recommend would give greater certainty to the revenue than the present system; but then take this case, suppose that the out-turn of opium in any year fell short from bad seasons, which frequently happen, then the revenue being a fixed rate per chest, would certainly fall off, would it not?—It would have fallen off in any case.

5346. If under the present system the out-turn is short, and there is a short supply in the Calcutta market, you get compensation by the enhanced price at the sales?—That is true, unless you take a series of years: if you look at the opium revenue, say, for the last 10 years, you find that the fluctuations have been very violent, and practically, that is a greater evil than the risk that you mentioned would be on the other side.

5347. But those very fluctuations showed this, that the less opium you brought to market the higher the price it realised, and it was the object of Mr. Iaing in extending the cultivation of opium to reduce the price. That shows that the smaller the production, and the smaller the supply, the larger the price realised; and proves that under the present system, supposing you have a deficient out-turn, it is made up in another way?—The experience of the Malwa system; I think, is in favour of greater uniformity than we have in Bengal, and its advocates on the spot assert that if it were left unchecked by the monopoly, we should have very much greater uniformity.

5348. In the Punjaub they levy an acreage tax on the opium?—They do.

5349. And the production in the Punjaub is very small indeed?—I believe so.

5350. And yet the Sikhs are one of the races of India who mostly consume opium. May not it be inferred that the plan of an acreage tax discourages the cultivation of opium?—I think not: the Sikhs are not a very large community. The Sikhs proper are not estimated at more than one million and a quarter.

5351. But still the production of opium in the Punjaub is very insignificant indeed, and it is not supposed that the opium there half supplies the wants of the Sikhs; they being an opium-consuming class it might be presumed that their

own country would produce enough, but it does not. The acreage tax is the cause, is it not, of that fact?—It is so light that it could hardly have that effect.

5352. But while in Bengal a man gets money paid him to grow opium, in the Punjaub he has to pay money for growing it?—Probably the question of soil has as much to do with it in the Punjaub.

5353. The circumstance must have a great effect on the inclination of the cultivator to grow opium, whether he is paid for it or not?—Probably it would have an effect.

5354. You said that you would associate the municipalities in the management of the excise system, but I apprehend that you mean by that that you would associate the municipalities in the management of the retail sale?—Of the retail sale only.

5355. Not of the levying of the Government duty on it?—Of the granting of licenses to retail dealers, so as to limit the number of shops.

5356. *Chairman.*] You would allow them to express their opinion as to whether a liquor shop was necessary or desirable?—Exactly, as the justices do here.

5357. *Sir C. Wingfield.*] But you would not allow the municipalities to interfere in any way between the licensed dealer and the grower?—Certainly not, nor would I allow them just at present, so strong is the prejudice, to put an absolute veto upon licensing.

5358. So that public opinion would not be allowed to control or effect the amount of revenue that Government might realise from an excise system?—Except in so far as it might lessen the demand in India through the shops.

5359. But the demand in India is so very small. *Sir Cecil Beadon* told us that the whole value of all the opium sold is only 300,000 £.?—But my remarks applied not only to the sale of opium only, but much more to the sale of liquor.

5360. The Sudder distillery system you have described, and you know that that prevails in parts of Bengal?—Pretty well over all Bengal now.

5361. And it also was introduced in Oude some six or seven years ago, and it also prevails in great parts of the North Western Provinces. Now you admit that this system, inasmuch as it puts the highest possible duty on spirits that spirits can bear, does not stimulate consumption?—My objection to it is that it does not put upon it the highest duty that it could bear.

5362. You say that in practice the authorities do not put the highest duty on it?—In practice they do not.

5363. But that system, admitting as it does of the highest duty being put on, is a good one and the best one?—Yes, if the highest duty is exacted.

5364. And you think that it should be accompanied by a further limitation of retail shops?—Yes; according to the wishes of the respectable inhabitants.

5365. But when you said that the British Government was subjected to the reproach by the natives of having encouraged drunkenness, surely if there were no excise system at all, if every man was free to make and sell and drink as much as he pleased, the evil would be very much aggravated?—My argument is that the excise system should be very much stricter. The natives continually argue for entire prohibition.

5366. But

5366. But that is the class of natives who do not drink?—The class of natives who do not drink being 999 out of every 1,000.

5367. I should entirely dissent from that view, because the people who are called the pariahs, the lowest classes, who must form a very considerable per-centage of the population, all drink; is not that so?—Of the hill tribes.

5368. No; of the plains: what are called the pariahs, of whom in every village there must be from 10 to 20 per cent. of the population; they all drink?—It is not so, to such an extent, in Bengal, unless in the case of the wild tribes.

5369. Have you heard that very great suffering has been caused, particularly in the rains and in winter times to the poorest agricultural classes, who have to be out in their fields at night in all weathers, from being prevented from obtaining as much drink as they required?—The only suffering that I have known of was among the Ghonds, when the Sudder distillery system was introduced into the Central Provinces, and that, as I said, has been modified to meet their special case.

5370. You say that the population of Serampore, since Serampore came under the British rule, has been very much demoralised by the number of liquor shops there?—Very much.

5371. Does not the population of Serampore consist largely of Christian converts?—I wish it did. The number of native Christians resident in Serampore is probably not more than 250 out of a population of 25,000. There is a Christian village there, with a population of about 200, but the majority of the men are engaged during the week in Calcutta. As a rule, the village is most moral, and certainly its vice is not drunkenness.

5372. It is very close to Barrackpore; and it is very much frequented by the soldiery from Barrackpore, is it not?—They are forbidden to cross; and the shops in Serampore are not licensed to sell to soldiers. One good feature of the abkari department is, that shops, which are not licensed to sell to English soldiers, have the fact distinctly announced above the doors, so that we at least protect our own soldiers, whatever may be said of our native subjects.

5373. Mr. Crawford.] You said that the experience from which you spoke had been derived from residence in India?—In Bengal, chiefly.

5374. Was that residence confined entirely to Bengal?—I have visited almost all parts of India proper for purposes of observation, and I know pretty accurately the whole of Northern India.

5375. Your experience otherwise than in Bengal is as a traveller, for the purpose of gathering information?—Quite so.

5376. But you have no such intimate knowledge of the native habits and mind in other parts of India as you have in Bengal?—No, I cannot speak their languages.

5377. What has been the rise in the rate of wages amongst the ordinary labouring population in Bengal, consequent upon the great employment of natives for the construction of railways?—It varies in different districts. Along the lines of railway and in the large cities, the rise in my experience in 17 years, has been for a man, from 2 annas to 6 annas a day; but in the more remote districts probably from an anna and a-half to 4 annas a day.

5378. What has been the effect of that rise in 0.59.

the price of labour upon the consumption of excisable articles the necessities of life?—The effect has been considerable; but I believe that wages have not risen in a greater proportion than the price of the necessities of life, so that the labouring classes are probably on the whole worse off than they were before English capital was introduced into the country; but the producing classes have largely benefited.

5379. The producing classes as contrasted with whom?—With the purely labouring classes.

5380. What has been the increased consumption of articles subject to the abkari tax?—We can estimate that only by the increase of the revenue:

5381. Do you think that in mixing with the natives and observing their habits you see the effect of any marked increase in the consumption of excisable articles?—Certainly, in the consumption of liquor and English cloth, and probably more salt is used than was the case.

5382. As you have mentioned English cloth, may I ask whether the English cloth is of equal durability to the native-made cloth?—Not for working purposes, but certainly for what the natives would call holiday purposes.

5383. If the advances which are now made for the purposes of the opium cultivation in the Bengal, Behar and Benares provinces were given up, would it be necessary for the Government to retain so large an amount of money in their treasuries?—I think not.

5384. You think that it would release a certain amount of the money, which would then become idle, as it were?—Yes; so that the Government might hold smaller cash balances than they do at present.

5385. You referred to the cessation of the export of rum from Calcutta to Australia, and stated also at the same time that there was a large import of sugar now into Bombay?—It is so.

5386. Do you consider that import of sugar into Bombay to be a novel circumstance?—I believe it to be so.

5387. But are you not aware of the fact that Bombay has never been a sugar-producing Presidency, that there has always been a large import of sugar into Bombay from China, Manilla, and Siam?—I believe that the largest import into the Presidency was from the sugar-producing districts of the interior, across the inland customs line.

5388. Do you say that upon any authority?—I should like to refer to Mr. Allan Hume's Reports.

5389. The Presidency of Bombay has been a very large importing place for sugar from the countries which I have mentioned, within my knowledge; are you not aware of the fact?—There is no question that the import of sugar into Bombay took an enormous start about the year 1864-65.

5390. Was not that due to the increase of consumption consequent upon the great distribution of money caused by the construction of the railways?—We considered it to be so.

5391. Is there not a large entrepôt trade between Bombay and the Persian Gulf and the Red Sea?—Yes, a growing trade.

5392. And consequently the increase may have had reference to its external trade, as well as its internal consumption?—Certainly.

5393. Is it not your experience that the im-
position

Mr.
G. Smith,
LL.D.

19 May
1871.

Mr.
G. Smith,
L.D.
19 May
1871.

position of new taxes in India, that is, of taxes to which the natives have not been accustomed, is very unpopular with the natives?—Very unpopular.

5394. And that it is desirable, if possible, not to resort to new methods of taxation, but to rely as much as possible upon the old methods which have been in force there, or to improve them?—The East India Company always acted in that way; but on the other hand, that Company was not forced by English public opinion into improvements to the same extent that the Queen's Government has been.

5395. Then you think that for the sake of improvements you might, to a certain extent, disregard native prejudice?—Not the prejudice of the mass of the people, for it is on them that the security of our power rests; but we might disregard the prejudice of the upper classes, who always have the means of crying out more loudly than their numbers, or the justice of their case would entitle them to do.

5396. Where do you draw the distinction between the upper classes and the masses of the community?—The agricultural and the artisan on the one side, and the trading classes on the other.

5397. You do not refer to offending the feelings of the native upper classes?—The native middle classes; the upper native classes we generally consider to be native princes, and the representatives of old houses, the aristocracy, towards whom I think, Lord Canning's policy was most admirable, and should always be followed.

5398. I am speaking now of the upper middle classes; you would not mind introducing new methods of taxation offending their feelings?—I think not; their wealth is entirely due to our rule, and they ought to contribute a fair share of it.

5399. Has not their opinion a very considerable effect upon the opinion of the classes beneath them; are they not able to lead them?—That is because the classes beneath them have not hitherto been educated; but we are now entering on an extensive system of vernacular education, which in the course of two generations ought to make the lower classes of India hold their own in a way they have never done before.

5400. You would not mind offending the feelings of the upper middle classes when that time comes?—No.

5401. You think it would be safe to disregard their feelings politically, and to impose on them such taxes as would be consistent with our English views of political economy?—If not very much opposed to their own prejudice as to the modes of taxation. As to the amount, we should exercise our own judgment.

5402. Under the present state of things, as long as Malwa is shut out from the sea, it is absolutely necessary, if we are to have any revenue at all from Malwa opium, that it should come to us in the form of a pass duty, is it not?—I think so.

5403. Do you think it desirable to apply that system to Bengal?—Very desirable.

5404. In the form of a pass duty from the place of its growth, or an excise duty on the article at the place of manufacture, or in the form of an export duty on leaving India?—In the form of an excise duty in the place of manufacture.

5405. Mr. Fawcett.] You referred just now

to the fact that in spite of a very great rise of wages in Bengal, owing to the introduction of railways, the mass of the people were not better off, the labourers were not better off in consequence of these increased prices?—That is so.

5406. Could you give any estimate of what the increased prices were during the last 20 years, we will say?—It is very difficult to assert anything of the whole of India.

5407. In Bengal, with which you are more acquainted, can you say there were?—In Bengal, I should say that the rise of prices has been not less than 30 per cent. since the Crimean war, which was almost contemporaneous with the extension of the railway system of India.

5408. Then I want to direct your attention to this point; there has been a constant rise of prices going on in Bengal and other parts of India; in other words, a constant depreciation in the value of silver; if that is the case, if prices are constantly rising many of the items which go to compose the expenditure of Government must be constantly increasing, must they not?—My belief is that prices for a time have reached their maximum. As a matter of fact, prices have declined from that maximum in the poorest of the Presidencies, that of Madras, during the last three years.

5409. But would you not attribute a part of the increased expenditure of the Government to the rise of the prices of commodities?—Certainly; the rise of prices has forced Government to increase the salaries of all uncovenanted appointments, and has increased the cost of the army.

5410. And if the rise in prices should go on (you think it will not, but suppose it does go on) although the policy of the Government remains exactly the same as it is at the present moment, their expenditure must increase against their will?—If the rise of prices goes on that would be the result.

5411. At the same time there are many items which compose the revenue of the Government which may be regarded as stationary, and which do not advance with the rise in prices; is not that the case?—That is the case.

5412. This possible rise in prices, therefore, has a very important influence on the balance of the expenditure and revenue?—Thus far that it puts Government in the position of considering the necessity of imposing new taxes or making the existing taxes more profitable.

5413. Defining equality of taxation according to the well-known definition by Adam Smith, namely, taxing people in proportion to their ability to pay, according to your opinion, taxation presses most unequally and most unjustly on the poorer classes of India, does it not?—Compared with the classes above them.

5414. That inequality and pressure would be greatly intensified if the financial policy of the Government should require them to increase the salt duty?—It would. But the Government at present desires so to equalise the salt duties that the very high rate charged in Bengal shall be reduced to the level of the other provinces.

5415. That being the case, do you suppose that the revenue from salt is likely to be maintained?—The revenue from salt would be increased, by leading to a much larger consumption. The present tax on salt has certainly operated to check the consumption to some extent of human beings, and to a very large extent

of

of animals; so that a great deal of the sickness of the natives in India, the mortality caused by the epidemics, and the extension of the cattle plague recently, have all been attributed to the insufficient amount of salt allowed to the people under our present high tax.

5416. You are probably aware that several persons who have been engaged in the official collection of the salt revenue have given very distinct evidence before this Committee, that the present duty on salt does not interfere with its being used for cattle, and does not in any way, or scarcely perceptibly, limit its consumption among the natives; do you think, from your experience, that that opinion is altogether erroneous?—I have studied the subject very carefully, and have investigated it in different gaols, both in Madras and in Bengal, and I have come to the same opinion as Lord Lawrence's Government, that the salt tax has reached the very highest point at which it would be proper, financially, or as a matter of justice, to place it.

5417. At present it is taxed far beyond the proper point, in your opinion; because if it were reduced a larger revenue would be obtained?—From larger consumption.

5418. Consumption would be increased so as to make up for the reduction of the tax?—Yes.

5419. You have said that the opium duty is not one on which we must place great confidence, as to its being retained in its present amount; but that in all probability we must look forward to a gradual reduction in the amount which it yields?—That is my opinion.

5420. That being the case, considering the revenue only, and the balances of revenue and expenditure, would it not be, in all probability, necessary, unless there is greater economy to impose a new tax to make up the deficiency?—I think that the deficiency can be met, to some extent, by limiting the expenditure upon public works, and also by reforming the public works department, so that we shall get better work for our money.

5421. That would come under the general head of having increased economy, and at the same time increased efficiency; but suppose that is not done, and that the present policy of management in India continues with the prospect of almost a certain decrease in the opium revenue, it would, under those circumstances, be necessary to impose some new tax, would it not?—Or to add to the existing taxes.

5422. There are very few, if any, of the existing taxes, which you could safely add to with advantage, are there not?—The excise duties, and, if it were unavoidable, as in Mr. Wilson's

time, the income tax might be taken at 2 per cent., instead of at 1 per cent., as at present.

5423. But you think, if I understand your evidence right, that any new tax imposed on the upper classes would be unpopular, and if imposed on the lower classes would be unpopular and dangerous?—And unfair, so far as the lower classes are concerned; the mere unpopularity with the upper classes of the natives is a matter that we should not consider, if our duty is plain.

5424. Mr. J. B. Smith.] You stated an opinion that the increase of the tax on salt has a tendency to diminish the consumption?—It has had that tendency.

5425. We have had it in evidence that in spite of the increase in the tax on salt, the consumption has increased?—I should say that it has not a tendency to diminish the existing consumption, but to diminish the natural increase of that consumption up to the limit which it ought to reach.

5426. But have you ever taken into consideration the effect of cheap carriage upon the price of salt?—That has very much to do with it.

5427. When a railway is made of 200 miles, where the salt was previously carried in bullock carts, is not that equivalent to a reduction of the tax on salt?—It is so equivalent to it that I believe that but for the extension of our railway system, it would have been impossible for Government some years ago to raise the tax in Bengal to its present limit, or for the Madras Government to increase the tax as it did last year, in order to meet the financial deficit.

5428. So that in fact, although there has been an increase in the tax on salt, it has not been felt by the people?—Not so much, owing to the facilities of carriage.

5429. Sir W. Lawson.] With regard to the opium, it is the smoking of the opium which you presume does more harm than eating it?—That is generally believed.

5430. And the great bulk, or almost the whole of the opium which we send to China, is adapted for and prepared for smoking?—Yes.

5431. Chairman.] The opium, as sent to China, is not prepared for smoking?—It is not necessarily prepared for anything.

5432. Sir W. Lawson.] As a matter of fact, it is more smoked than eaten?—Yes.

5433. Sir Charles Wingfield spoke about high duties having the same effect as prohibition in regard to spirits in India; I presume that there would be no difficulty at all in carrying out prohibition, and that the natives would like it better than a system of high duties if the Government chose to adopt it?—There would be little difficulty in regard to that in India.

Mr.
G. Smith,
LL.D.
19 May
1871.

Sir Wilfrid Lawson.
Mr. Lyttelton.
Mr. McClure.
Mr. John Benjamin Smith.
Sir Charles Wingfield.

THE RIGHT HONOURABLE ACTON SMEE AYRTON, IN THE CHAIR.

Mr. THORNVILLE THOMAS COOPER, called in; and Examined.

Mr. F.T. Cooper. 5434. *Chairman.* You have been for some years, I think, in China?—I have been for five years in China.

5435. And you have travelled extensively in that country, I believe?—I have travelled from east to west in China.

5436. Did you in the course of your travels obtain information respecting either the consumption of opium in China, or the cultivation of opium in China, or both?—During my travels I had extensive opportunities of noticing the cultivation and the consumption of opium and its effects on the people.

5437. Did you find that the cultivation of opium in China was increasing or otherwise?—I cannot say of my own knowledge that it is increasing; but speaking of inquiries that I made of French missionaries who have lived many years in China, I may say that I was told by them generally, that so far as 34 years ago, when they went out to China as young men, the growth of opium was unknown in the province of Szechuen.

5438. Can you state, generally, under what conditions it is grown in China in its economic production?—The production of opium in the province of Szechuen and the production in the province of Yunnan rather differ: that grown in Szechuen is grown rather under the ban of the officials although allowed to be grown, and there is much less grown there than in the province of Yunnan; that grown in Yunnan is preferred by the inhabitants of Szechuen and commands a higher price in all the markets.

5439. Is that an irrigated province?—No, it is grown on the higher lands; on the high and dry land, crops are sown about the beginning of January, and in the month of March I observed that the plants were about three inches high; they are sown in rows probably from 15 to 18 inches apart. The plant in Szechuen grows, as the Chinese express it, short and fat; it grows on an average three heads to a plant, or three pods to a plant; it is harvested about the end of April, but it suffers a good deal from showers of rain in the harvest in Szechuen and in Yunnan also. I think it is in the end of April that it is harvested.

5440. Did you ascertain at all at what cost the opium was produced in any given condition?—No, I cannot speak to the cost of the crop.

5441. Did you ascertain what sort of quality the native-grown opium was as compared with that imported from India?—Very inferior; the Yunnan opium is next in price and in the estimation of the people; and the Szechuen ranks last as most inferior.

5442. Did you ascertain at all what profit was derived by the cultivator, or by any intermediate agent?—In Szechuen the profit on opium crops may be said really to be nothing, for they grow just sufficient for their own use; I am speaking of three years ago; they then were growing just barely sufficient for their own use, and there was a small trade between Yunnan and Szechuen, that is to say, that opium was exported from Yunnan into the province of Szechuen.

5443. Did you find out whether that trade was considered profitable or otherwise?—To small dealers, those men who purchase 20 and 30 taels worth of opium, make a profit probably of from four to five taels on an outlay of 30 taels; that, at least, is what I made myself on an opium transaction.

5444. Are there any steps taken to levy any tax on the opium grown in China?—No; no direct Government taxes are countenanced; but the mandarins permit people to grow it on receiving a secret-fee. The satellites of the Yams generally find out where the opium is cultivated, and a fee now silences all opposition.

5445. Does that amount to a serious charge upon the cultivation?—It does; I dare say they would grow more if it were not for that prohibition, and the consequent feeing of the mandarins.

5446. Do you know at all what per-centage on the cost the fees and gratuities amount to?—No, I could not speak to that; the probability is that a fee of a tael or two per field of opium will be the extent of the bribe.

5447. Then we may understand that there is no general exportation of opium from these provinces to any amount?—When I passed down the Yangtze in 1868, I inquired at the Hankow Customs House if there had been any exportation

tion of Szechuen or Yunnan opium to Hankow, and then I could not learn that there had been any exported to Hankow.

5448. Did you ascertain at all what was the produce of opium of any particular quality or condition per acre, or any other measurement?—No, I had no opportunity of making such observations.

5449. Do you know whether it is grown in any other provinces in China?—It is grown in many provinces; there is some grown in Kwei-Chow, and in Shansie, and I have heard of its being grown in Hoonan, but I cannot speak to the truth of that.

5450. Is it grown in any of these provinces on a large commercial scale, or merely as a garden crop for consumption?—It is what I should call a dabbling crop at present; the natives grow a little for their own consumption, and not for trade, excepting in Yunnan; there is a slight trade between Yunnan and Szechuen.

5451. Did you find the opium imported from India very largely diffused then throughout the country?—No, the Indian drug never goes to the west of China; the people of the west of China will not smoke the Indian drug.

5452. Is the consumption limited to certain provinces?—The consumption of Indian drugs is chiefly confined to those provinces, which are reached by our open ports on the east coast.

5453. What portion of the whole population of China may be said to be consumers of the Indian drug?—The population of the eastern provinces, from the province of Pèchelee southwards.

5454. Could you state numerically what is the population?—I could not state it nearer than to say that the Indian drugs are confined exclusively to Eastern China and the native drug to Western China, drawing the line between Eastern and Western China at Hankow.

5455. Did you find that the consumption of the Indian drug was extending at all, or diminishing, or in what state is it?—I should say that the consumption of our Indian drugs has been increasing in Eastern China for some time.

5456. I mean in the area of consumption?—Yes, as we open up ports on the Yangtze, for instance, and as the rebels from the Eastern Provinces recede, and trade revives, so I think that the consumption of Indian opium spreads.

5457. You think that the consumption of the interior was limited by the difficulty of getting it transported into the interior?—That is in the eastern part of China.

5458. Do you find that there is any increase of consumption as regards the quantity that people consume, or the taste for it?—Yes, I think that it is becoming alarmingly prevalent in Eastern China, and in Western China also.

5459. Is that consumption by smoking or eating?—The Chinese only smoke opium; they are not opium eaters at all.

5460. Have you any idea what quantity an individual who is ordinarily fond of opium consumes?—About an ounce of raw opium a day, is a very good allowance; that is to say, between 15 and 20 pipes of opium is a large allowance for a man. The generality of men that I have seen smoking, and have smoked with, have not taken more than from six to ten pipes a day.

5461. Is that carried on every day in the year?—Yes. If they once become habituated to the use of opium, that is if they smoke for a week or ten days a pipe of opium every day, it becomes

almost impossible without some medical assistance to leave it off.

5462. But is there no intermediate stage between the confirmed smokers that you have described, and people who use it slightly?—I have seen in the case of many Chinese, and, in fact, I have experienced it myself, that if you smoke a single pipe of opium once or twice a week, it has very little effect on you; but if you smoke for three or four days steadily, a pipe or two a day, it begins to affect you so seriously, that before you can rouse your energy sufficiently to go about your daily work, you have to take your quantity of opium, a pipe or two pipes.

5463. I want to understand from you what would be about the consumption of a person who might be said to smoke moderately and reasonably, as compared with the consumption of a confirmed smoker, such as I understand you to describe?—I should say that the average smoker smokes from a half to three-quarters of an ounce of opium, and a very great smoker would smoke from an ounce and a half to two ounces and over. In fact there is scarcely any limit to what the old men who have smoked all their lives will do.

5464. Is the consumption confined to all male adults?—No, it is extensively smoked by females, and by boys and young girls from the age of 11; that is in the very lower orders.

5465. How can they afford to spend their money in that way?—Well on the same principle that many drink gin in England that cannot well afford it.

5466. I am looking to the cost that opium would be probably in China; it seems to be a heavy cost considering the low rate of wages in China?—I do not know, I am sure, how they manage to smoke; but I know they are obliged to smoke it, even though they cannot get food they must have opium, and they go without their food in order to have it.

5467. Do you know the cost of an ordinary pipe of opium in any smoking house?—No, I could not say what it is. It cost my chair-coolies that carried me for about two months, 150 cash per evening.

5468. What does that represent?—A thousand cash is equal to one tael. I have got the tael down at the value of 6s. 8d.

5469. How many men were there in that instance?—I had eight coolies to carry my chair.

5470. What would their wages be?—250 cash per day.

5471. They smoked three-fifths of their wages, then?—Yes, they allowed themselves 100 cash for food.

5472. Each man had 250 cash per day?—Yes, and out of it spent 150 on opium.

5473. And how many pipes do you suppose he smoked?—I must tell you that these chair-coolies, and all labourers of that description, such as boatmen in the great water-highways, are very much addicted to opium; they are great smokers, and they would commence to smoke about eight o'clock, p.m., and would be smoking till three and four o'clock in the morning.

5474. Do they do severe manual labour?—Yes; they carried me, on an average, 20 miles a day.

5475. Then that would represent the extreme consumption by a labouring man?—Yes, and I think that if I speak of the boatmen and the chair-coolies,

Mr.
T. T. Cooper.
23 May
1871.

Mr.
T. Cooper.
—
23 May
1871.

coolies, or carriers of China, I speak of a very large portion of the poorer class who consume a greater quantity of opium than the higher and middle classes do.

5476. Do you think that there is much room, then, for an increased consumption per head of the people who now smoke opium, or that it may be regarded as having reached quite a maximum consumption?—I do not think that it is possible that it could be worse than it is without the calamity becoming so great as to give rise to very strong measures on the part of the Chinese Government.

5477. Do you think that the area of consumption has not diminished as regards the extent of the provinces in which Indian opium may be consumed?—No, I think that for Indian opium there would be room for greater consumption. As the Eastern Provinces of China become more settled, after the effects of the rebel inroads, Indian opium may be consumed in greater quantity.

5478. Do you think that that consumption of the imported drug is likely to be checked, or met by the consumption of the native-grown China opium?—I think that unless the Indian drug is able to be put into the market as cheap as the native drug, the native drug will be forced into competition with it.

5479. We have not yet got from you what is the relative cost of the native growth now in China as compared with that of the imported opium at any given point. Will you have the kindness to state that?—I made the following calculation while residing in Yunnan: Indian opium costs 20 per cent. more in Eastern China than native drug costs in Yunnan, and Yunnan opium is worth in Western China 30 per cent. more than Szechuen opium.

5480. Sir C. Wingfield.] You say that these men who were very great smokers, your chair-coolies, went through a great deal of hard work in the day; then the consumption of opium had no debilitating effect on their physical strength?—While they were labouring under the influence of that opium, that is, as long as they had their opium every day regularly, they could perform prodigies in the way of work, but if they lose their opium for one day the effect becomes terrible; a man will lie on his bed with the water streaming from his eyes, and listless, and altogether disinclined to eat, and unable to sleep, as the result of it.

5481. Is this immoderate consumption of opium supposed to shorten life?—That is a question that interested me, very much with regard to these coolies. I never saw a grey-headed chair-coolie.

5482. Have you any opinion as to whether the extension of the cultivation in China is likely to cause a falling off in the revenue derived in India from opium?—I do not think that for several years to come the native-grown opium can in any way affect the Indian drug.

5483. You think that the Indian drug will always command a market in China from its superior quality?—From its superior quality in this way, that if a man has been accustomed to smoke five pipes of Indian opium in order to work up his stamina to the proper pitch, he must smoke 10 pipes of the native drug, and more, to cause the same effect.

5484. You said that the people of Yunnan and Szechuen, the more Western Provinces, will not use the Indian opium, and that the use of the

Indian opium is more confined to the Eastern Provinces?—Yes; those who are accustomed to the native-grown opium in Western China will not look at the Indian opium.

5485. Why?—They say it is too strong.

5486. Therefore these people that you described were smoking the native drug?—Yes.

5487. They could not have smoked that quantity of the Indian drug, I suppose?—They could have smoked it, but the effect would have been greater if they had not got their supply. They would probably, after smoking it a week or two, have had to spend 350 cash for their proper quantity of opium.

5488. Is not the native drug mixed with the imported, so as to lower the price of the imported?—I should say it is probable that in Quantung, that is the province of which Canton is the port, the native drug is mixed with the Indian drug.

5489. You have also been endeavouring to effect a passage from China to Assam; you went into Thibet, did you not?—Yes; through the Eastern Kingdom of Thibet.

5490. Did you find opium much consumed in Thibet?—No; Thibetans never touch it.

5491. Is no opium grown in Thibet?—None whatever; not in any part of it. I should mention, by way of proving that the Western people will not touch the Indian drug, that I met a Nepalese ambassador in the Province of Szechuen in the capital, and he had several hundred chests of Indian opium with him which had been transported from Nepal free of cost by Thibetans into China, and it was offered there in Szechuen, at the capital, at one-third the price of the common native drug, and yet he could not sell a chest.

5492. He had bought it as a speculation?—Yes, as a speculation. The ambassador in coming from Nepal has, I think, 1,500 horses allowed him to go to the Court of Peking, and these 1,500 horses on this occasion were, many of them, used for carrying opium.

5493. Mr. Crawford.] What is the staple food in the district of the Province of Yunnan?—Rice and pork.

5494. Is the rice imported, or is it the produce of the province?—It is the produce of the western plain of Win-cheang-chien principality.

5495. The same soil that produces rice would not produce the poppy, extensively cultivated, would it?—The same ground, provided it is not swampy, would; I have seen opium growing alongside of a paddy field that has been newly irrigated.

5496. And would any extensive cultivation of the poppy in China displace the cultivation of grains for food?—Yes, very seriously.

5497. Do you think that would of itself be a bar to the extension of the cultivation of opium, so long as they can import it on reasonable terms?—Yes. The system of rice cultivation in China is this, that in the month of February the paddy fields are all flooded with water, and this water is allowed to remain on the field for two or three months; in fact, later, for nearly four months the fields are flooded, and at the end of April they begin to sow the paddy. The paddy fields must be irrigated all this time to fructify them, and as they are sowing the rice they are reaping the opium.

5498. Up to what latitude can they grow rice in China?—I do not exactly know. I know that the

the Northern Provinces do not grow rice; they use flour made from wheat. I think in Shansee they grow very little rice, and in Pechelce, and other northern provinces.

5499. Did I rightly understand you to say just now, that in consequence of the progress of the rebellion in the Eastern Provinces of China, the consumption of opium has been extended?—No, the Yunnanese as a body, that is the Mahomedan Yunnanese, do not smoke opium; it is against their religion. Still there is a very large Chinese population that do smoke it in the eastern parts of the province.

5500. Mr. Bourke.] Have you ever been in any place in China where the native drug, and the Indian drug, come in competition with one another?—No.

5501. As a fact, then they never are brought into competition with one another in China?—I could not say what it might be now; it is certain that in Hankow and Shanghai I never heard of the native drug at the time I left China in 1868; in fact, having seen so much opium in China, I made a point of inquiring at the Customs whether there had been any opium from up river.

5502. And in Western China does the Government encourage the growth of opium?—It does not encourage it, because there is a standing order which was issued by the grandfather of the present Emperor prohibitory of it; but the officials wink at it; as long as they get their bribe they do not care.

5503. Sir Wilfrid Lawson.] I see in the Report of the Delegates of the Shanghai General Chamber of Commerce, presented last year to the House of Commons, that at page 23 they say, "We were told that in Szechuen a man can buy enough for a day's consumption for 20 cash, and that the use of the drug is becoming universal, even among the peasantry; the popular belief is that already eight men out of every ten, and one-half of the women, smoke. The spread of the habit seems to be exciting alarm among the wealthy classes, for we were told that a reaction was setting in among them, and that they began by their example to discountenance the use of the drug;" does your experience corroborate that?—Not entirely; when I purchased opium in Szechuen and my coolies also, as I have said, they paid 150 cash for their supply; 20 cash did not buy sufficient for a day, either for my coolies, or for any other person that I saw smoking.

5504. "We were told that in Szechuen a man can buy enough for one day's consumption for 20 cash, and that the use of the drug is becoming universal even among the peasantry;" is that according to your experience?—I have already said that there cannot be much greater consumption without causing such a calamity, that the Chinese themselves will cause a reaction. I do not think 20 cash will buy sufficient for the supply of opium for one day.

5505. Then on page 24 the delegates say, "There is so much concurrent testimony to the fact that the actual consumption of the drug in China is growing steadily year by year, and at even a faster rate than it did before 1854, that no other conclusion can be arrived at than that native-grown opium is actually superseding the Indian product;" is that correct?—Not in Western China, most decidedly not; there is no

0.59.

Indian opium in Western China; it never goes up river at all.

5506. That remark applies, then, solely to Eastern China?—Solely to Eastern China if native drug is superseding Indian opium, and I do not think it is.

5507. Does the prohibition of the cultivation of the poppy still hold good?—No, it is a dead letter quite.

5508. But it is not taken off the statute book?—No, it still remains as a prohibition.

5509. How do you account for its remaining there, and not being observed at all?—As in the case of most other laws in China that are not carried out, the mandarins are so corrupt that wherever they can sell the law they will do it.

5510. But the object of the prohibition was to prevent the consumption among the people?—Yes; the edict was promulgated by the present Emperor's grandfather, who killed his youngest son when he was found smoking opium, and after that took place he published this edict, that no one should smoke opium, and that it should not be cultivated.

5511. Do you remember the date of that?—I cannot give the date; I know that it was issued by the grandfather of the present Emperor.

5512. I presume that the opinion of the masses of the people would not support the authorities in carrying out that edict, as far as you know?—Well, the Chinese themselves all admit that the effects of opium smoking are bad; in fact, I have had hundreds of applications from Chinese for medicine to destroy the influence of opium; they asked me if I could give them anything which would destroy their appetite for opium; they themselves have no drugs, nothing to alleviate the craving for it; having once taken to smoking opium they must go on; the native doctors cannot deal with it in any way.

5513. Do they smoke tobacco largely?—Yes, very largely in Western China; in fact, all through China they are great smokers.

5514. Do those men who smoke tobacco seem to have a craving for the opium also?—Yes; opium smokers are all tobacco smokers, more or less.

5515. I suppose an inferior sort of opium means opium which does not stupefy them so quickly?—If I might draw a parallel, it is the difference between a very weak Havana cigar and a very strong one.

5516. It does not affect them so quickly?—No.

5517. Their object in smoking is speedily to be affected in the peculiar way in which opium does affect the brain?—Yes; their object is to be speedily affected, but the term stupefy is not expressive of that effect.

5518. I think, in one part of your evidence, you said that you had never seen any grey-headed coolies; but previously you mentioned having seen old men who had smoked all their lives; is it the case that you have seen men who have smoked opium all their lives?—Yes; you often see men of 50 or 60 smoking opium; but then a man of that age, a confirmed opium smoker, probably spends 16 hours out of the 24 in smoking. For instance, before he can rise to dress himself in the morning, he must have several pipes of opium; then he will go on three or four hours during the day very briskly; then, towards the afternoon, he gets restless, his eyes begin to run, and probably at five o'clock he will commence again, and smoke till two or three in the morning.

114

5519. The

Mr.
T. T. Cooper.23 May
1871.

Mr. T.T. Cooper. 5519. The fact of seeing old men who had gone on in that way for some time seems to indicate that the use of opium is not a means of shortening life?—I do not believe it is, if they get their supply; it is a matter of supply merely. If they get their supply all their life they never feel very much from it; but the moment their supply is stopped they soon collapse.

5520. From what you said about the coolies, I conclude that they are able to do an immense deal of work?—Yes; the effect of opium is, that they are able to do an immense deal of work; but the moment the supply is stopped the effects are terrific.

5521. But it does not appear to shorten life much, and it seems that those who use it are able to work hard. Whence, then, arose the great objection to it on the part of the authorities?—It is an expensive luxury, and causes, like drink in our own country, very much distress. The women and children of the families suffer from the vice of the father, and in a great many instances the women smoke too, so that they spend all their substance on opium.

5521*. Perhaps your idea is that the objection of the Chinese authorities to it principally arose from the ruinous expenditure which it gave rise to?—Yes; from the poverty which it brings on those who are addicted to it.

5522. Do you think, from your own experience in travelling over China and investigating these matters, that the use of opium there causes as much public injury as the consumption of drink in England, as far as you can see?—Yes, I think that the effects of opium smoking in China are worse than the effects of drink in England, as far as my experience goes.

5523. But it does not cause the amount of crime that we suffer from in this country as the result of drink?—No. A man when he commences to smoke lies down on his bed and does not get up till it is finished. It is very costly and very dangerous in this way: that if a man has been in the habit of smoking opium and he has not money to supply himself with opium, his constitution then receives such a frightful shock, that it shows very quickly; but as long as he takes his regular quantity of opium every day he does not feel anything; he must have it, but it does not destroy his health because he eats and he works, but if he loses his supply of opium on Monday morning, on Tuesday morning he will be ruined for work all the rest of the week; he will not pick up again, the system seems to fall so from the want of opium.

5524. And probably a man accustomed to it all his life would die?—They do die in China from that cause. In the more populous parts which I have gone through, generally after starting on my journey early in the morning through the suburbs of the towns, before the watch have had time to go round, it is a very common thing to see half-naked men lying dead simply from want of opium.

5525. I understand that you think the evils which arise from the consumption of opium arise from the poverty that it causes, and not from any crime; that it does not lead to crime?—It leads to crime in this way; that men will do anything, they will sell their children, their wives, their mothers, and their fathers, to get opium.

5526. Mr. Birley.] Is the edict prohibiting opium universally disregarded, or are there provinces or districts in which the mandarins are

sufficiently upright to maintain the law?—Everywhere it is disregarded.

5527. I suppose it was not on the score of distress that the Emperor of China put his son to death for smoking opium?—He considered it a vicious habit, and was very angry at finding his son indulging in it. It was rather an accident. The boy was brought before his father, charged with having smoked; his father kicked him, and caused his death.

5528. Can you tell me whether the craving for opium is supposed to be natural, or merely an acquired taste?—I think that a Chinaman who has never smoked opium has no desire for it.

5529. If they had not smoked opium in early life, they would not require it?—No.

5530. You spoke of the middle and upper classes as not smoking to the extent of the lower classes. Can that be because they smoke in secret, do you think?—No, I think that the higher classes of the Chinese consider it rather degrading to smoke opium, but I invariably found that the mandarins, and higher classes who do smoke opium, are much more inveterate smokers than the poorer classes; that is to say, they can afford to buy more, and indulge to a greater extent.

5531. Mr. Beach.] What action do the Chinese government take with regard to the introduction of Indian opium; do they take means to prevent it in any way?—No, I think they rather like it than otherwise, it gives them a certain revenue.

5532. They levy an import duty upon the Indian opium, do they?—Yes; there are several taxes levied on the introduction of foreign opium. The Chinese Government, of course, say that they are very badly treated in having the opium forced on them, and that it is against their wish; but really the Government do not care so long as they get their revenue; they care very little what becomes of their people, not only in regard to opium, but in every other respect.

5533. Is there a legitimate import duty paid to the Government?—There is one tax (I think it is a war tax) that I remember in Shanghai that was levied by order of the Taotai, and he is the representative of the government; all natives buying the opium from foreign hong had to pay 30 taels a chest to the Taotai. This tax of 30 taels a chest that I speak of (there may be an import duty that I do not know) was levied only on the purchaser, not on the foreign importer; that is, when the opium was sold by a foreign hong and handed over to the natives, this tax was levied on the natives who purchased the drug and by order of the Taotai, and it was called a war-tax.

5534. They obtained profit from foreign opium, and the edict only goes to the poppy grown in their own country, therefore?—Yes, and the edict of the Emperor probably refers exclusively to the cultivation of opium in China.

5535. And if opium is grown in China they would not obtain any revenue from it, except what was surreptitiously obtained by the mandarins in defiance of the order of the government?—Yes; that is what the mandarins at present reap; that is why the prohibition is a dead letter.

5536. Mr. Hermon.] I think from your evidence it would appear that the effect of opium smoking is rather to stimulate than to act as an opiate; I understand you to say that these Chinese coolies cannot do their work until they have taken a large quantity of opium every morning?

morning?—Yes, it is a stimulant most decidedly; if a man does not get his opium in the morning he cannot do anything.

5537. In the primary introduction of opium, or the primary taste for opium, when a man begins smoking opium what is its first effect; is it an opiate, the man then requiring an extra amount as a stimulant?—I can only speak as to its effect on myself; on the first occasion of my smoking a pipe of opium it gave me a headache, and I could not sleep all night; and on the next occasion it made me feel rather comfortable than otherwise; the same as a pipe of tobacco would do after being deprived of tobacco for a day or two.

5538. Mr. Lyttelton.] Sir Frederick Halliday told us that the emperor's edict was especially dropped for the purpose of meeting us English, and putting an end to our trade; do you think that that is too strongly stated or are you not aware that such was the case?—The edict has not been dropped; we have had no notification of it, I believe; at least I never heard of any notification to that effect; in fact, if I mistake not, the Chinese government at Peking in a memorial to Sir Rutherford Alcock, urged as a plea against the introduction of opium, the existence of this edict.

5539. Was that a short time ago?—Within the last year, or year and a half.

5540. Sir Frederick Halliday referred to papers which show that the Chinese Government are deliberately, and wilfully, and of set purpose, encouraging the growth of opium in China, with a view to revenge themselves upon us, and to stamp out our opium revenue; that they are openly and avowedly doing it for that purpose; have you any remark to make upon that?—If the Government are encouraging the growth of the native opium at all, to affect the Indian drug, they must pass it through the custom houses on the great water highways, and in that case a reference to the annual customs returns of China would show whether the drug is being sent from Western China to Eastern China or not, and to what extent it is being sent.

5541. Mr. Eastwick.] Do you know at all whether the Taepings or the Mahometan rebels put down the opium smoking to any great extent?—The Taepings, I think I have heard, set their faces against it, but nearly all the ragamuffins attached to the Taepings were opium smokers, as far as I was able to observe.

5542. You do not think that there was any great diminution of opium smoking in that way?—No; the Mahometans in Yunnan set their face entirely against the use of opium. It is against their religion.

5543. They punish people, I suppose, for the use of it?—No; I have heard of no punishment; I know they did not punish when I was among them, because some Mahometans in Yunnan did smoke secretly in my rooms fearing the censure of public opinion, nothing more.

5544. I suppose that about three pipes of opium a day would be rather beneficial than otherwise if a man could keep to that?—No, I think not; because if a man is in the habit of smoking three pipes a day, and by any misfortune he could not get his supply of opium he would be very ill.

5545. Even with so small a quantity as that?—Yes; I can give an illustration of that; I had a Chinese coolie from Thibet, who joined me at a 0.59.

place called Batang, about 200 miles from the capital of Szechuen. He had been taken into Thibet by a Chinese mandarin, and he agreed to return with me to China for three taels, that is to say, about a pound, and I asked him if he was an opium smoker, when he said "No." After I had started a day or two's journey into the mountains I discovered that he was an opium smoker, smoking six pipes every day; the fatigue of travelling in the mountains, I suppose, had made him smoke more opium than he could afford, that is, 12 pipes, and at the end of five or six days he became stupified and useless for want of opium, so that I eventually left him behind in a state of insensibility.

5546. Do you think that if the opium smoking was put down there would be the drinking of spirits instead among the Chinese?—They are very heavy drinkers of spirits; I think they would drink more.

5547. Do the opium smokers drink the san-shoo?—Yes; but it is impossible to put down opium. You would destroy one-third of the population of China if they were deprived of opium.

5548. It could not be done now?—Not now; only by a strict system of registration from the birth; it might be wiped out by legislation in this way.

5549. Then to stop the trade on the eastern coast would be a great national calamity?—If Indian opium were stopped at once it would be a very frightful calamity indeed. I should say that one-third of the adult population would die for the want of opium; and the Chinese Government in wishing to stop it are acting, as they generally do, without any idea of the welfare of the people.

5550. Is much opium given to people in the boats and in other places?—Yes; it is difficult to go into any of those places without having a pipe of opium forced on you.

5551. And is advantage taken of the smokers to rob them?—No; there is not much in that way for the smokers are not stupified. I have not observed or heard that robberies are frequent in these places, but a great many of the respectable middle-class youths become opium smokers from frequenting the houses where the opium pipe is produced at once.

5552. Is there any opium smuggling along the coast?—I could not speak to that.

5553. Mr. Beckett Denison.] I have here the Report of the Delegates of the Shanghai Chamber of Commerce; will you turn to page 23, the second paragraph, the latter part of it; "For the last five or six years or more, especially since the death of the Viceroy Loo, in 1867, it has been grown more openly in Szechuen, and although an Imperial edict was again issued last year strictly forbidding it, and though the Viceroy of Szechuen issued a proclamation to the same effect, yet the executive authorities have found it absolutely necessary to shut their eyes to the existence of the plant; and it is significant of the impotence or the venality of the Chinese authorities, or the discord between the Imperial and provincial governments, that the white poppy fields may be seen on the most conspicuous places on the Great River route, while the cultivation of it is nominally punishable with death;" is that your observation?—Quite so.

5554. Then it goes on, "The consumption of opium

Mr.
T.T. Cooper,
23 May
1871.

Mr.
T.T. Cooper.
23 May
1871.

opium in China generally is, by all accounts, increasing at a very rapid pace," is that also your observation?—Yes, I think it is quite true that it is increasing.

5555. Do you know at all why the Chinese authorities up the country are obliged to shut their eyes to the fact, although it is prohibited?—Simply because there is such a large proportion of the population who smoke it, that they dare not and cannot prevent them; they must have it; as I say if the Chinese to-morrow wished it, and the Indian Government were to stop sending opium into China, it would be the death of one-third of the population.

5556. And yet the habit of opium smoking, as it is carried on at the present day, is a habit which has grown up comparatively of recent years, is it not, since 1830?—No, the habit of smoking opium on the western borders of China has existed for a great many years; probably, I might say, a couple of centuries; the tribes of the Lantsun-kiang, and those tribes bordering the northern parts of Burmah and Assam have cultivated opium for generations.

5557. Will you turn to the third paragraph on that same page 23: "When Patna opium had been introduced from Canton, and had made some way in Szechuen and the neighbouring provinces, it was worth, in the early years of the reign of Taoukwang (1821), double its weight in silver; at that time the people cut the opium in slices, which they rolled up in paper, and smoked like a cigar; hence the name ya p'én (slice). The opium pipe is believed by the people of Szechuen to have been a Canton invention, dating from about the 10th year of Taoukwang (1830);" do you agree with that?—I should say that it is quite a native idea; in fact, I may say that I am certain that it is not correct; in the first place, opium would not smoke in that way, in slices; I may add that I never heard opium called ya p'én by Chinese.

5558. Sir T. Bazley.] Do the women smoke as well as the men?—Yes; but not so much.

5559. Mr. Beckett Denison.] Do you agree in this, that, after making every allowance, "the fact remains that it is its relative cheapness that constitutes the inducement to use native to the gradual exclusion of foreign opium"?—No; in speaking with regard to Eastern China, native opium is not strong enough. There are two divisions, Eastern and Western China. In Western China, the native drug alone is smoked; in Western China, from beyond Han-kow, the people will not touch the Indian drug at all; it is too strong. And, on the other hand, in Eastern China the people will not smoke the native drug because it is not strong enough.

5560. Will you turn to page 22, and, under the paragraph "Foreign Opium," you will find this: "Foreign opium is also brought to Chungking by Canton men, in tins, prepared. Estimated value, 70 a.; 80,000 taels annually; all smuggled. It is used as a luxury." That may or may not be true?—I should say that very likely as the officials in all the yamuns come from different parts of China; those officials in Western China who are sent direct from eastern provinces. It is the system of the Chinese Government to change every few years, and who have been accustomed to smoking that eastern drug would naturally like to have the Indian opium up in Szechuen with them. But it is quite a luxury,

and the consumption of it is so small that it is scarcely worth alluding to.

5561. Would you turn to page 37, regarding another province, Kwei-chow, and you will see this under the heading "Misery of the People:" "The present condition of the people is deplorable in the extreme. Distressing poverty prevails throughout, and in many parts of the country large bands of robbers render travelling from town to town highly dangerous. Opium, which is largely cultivated, taking the place of wheat, barley, and pulse, is, notwithstanding its high relative value as compared with other crops, really an additional cause of poverty, since a large portion of the amount produced is said to be consumed by the inhabitants. The Imperial proclamation against opium has been entirely ignored by the mandarins." Is it actually the fact that the misery of the people can be traced directly to the cultivation of opium?—I have not been in the province of Kwei-chow, and I could not say. I can say one thing as regards the province, that it is inhabited by independent tribes; and all the independent hill tribes of Western China cultivate their own opium, and smoke it very extensively.

5562. Then the misery there spoken of may be as much owing to the banditti and robbers as to any other cause?—Yes, nothing more likely; these, in fact, are hill banditti; and that is the reason that the province is so thinly populated; they have never been subdued by the Chinese.

5563. Do you believe that it will be entirely beyond the power of the Chinese Government to put down the use of opium?—It is beyond human power to put down opium smoking in China at once without sacrificing the population.

5564. Mr. J. B. Smith.] Can you form any idea of the proportion that the exports of Indian opium bear to the whole consumption of opium in China?—No, I should say that it was impossible to find out what the consumption of opium is in Western China; I should not like to speak of it myself; as the only Englishman who has travelled in Szechuen and Yunnan, I should be inclined to take native reports with very great care; the Chinese in speaking of those matters have no idea of numbers.

5565. Mr. Beckett Denison.] Have you any knowledge of the province of Shantung?—No.

5566. A gentleman, who has been in China, says that although they are large opium smokers they are amongst the finest of the Chinese population; would that agree with your experience?—I have already stated, that as long as a man has his supply of opium, it does not appear to affect him; it is the want of it that affects the man.

5567. Mr. J. B. Smith.] Do you think that a great part of this misery which exists in the eastern districts of China is attributable to our exports?—I think that the effects of the Indian drug on the eastern Chinese of the very lower orders are bad and lamentable.

5568. And that has increased since our exports?—I should say very considerably.

5569. Mr. Grant Duff.] After your return from Western China you went back, I think, to Shanghai?—I came back from Thibet through Shanghai.

5570. And then you went to Calcutta?—Yes.

5571. And I dare say there you were asked a great many questions about opium, were you not?—Not in my first visit to Calcutta.

5572. But

5572. But later you had the opium question brought a great deal before you?—Yes, I had.

5573. And what is your general opinion; do you think that we have much to fear in India from the competition of the native drug, or not?—I do not think that we need fear any competition of the western drug, provided we will give the Eastern Chinese the Indian drug at a moderate price; and even at the present prices I do not think that for several years to come the western, or the native drug will compete with the Indian drug. I stated this opinion, I may observe, two years ago in a memorandum written for the Chamber of Commerce in Calcutta. It was anticipated two years ago that the demand would fall off; and I stated then what I have stated now, my belief that the native drug would not enter into competition with the Indian drug for some years to come. But that it might do so, with high prices of the Indian drug, is very probable. There is the power of growing it in China, and there is a population to cultivate it, and there is a population to consume it. Therefore, if we wish to cut off all competition between native and Indian drug, we must reduce the price of the Indian drug, or we shall force on competition. Those are my ideas.

5574. Have you formed any opinion how much we should reduce it; what would be a reasonable price per chest?—No, I could not speak to that. It could be easily ascertained from the quotations in the Hong Kong and Shanghai opium market as to the price of the two drugs.

5575. Have you formed any opinion as to the cause of the unexpected rise in this last year of opium; because, you will remember that everybody at Calcutta expected that there was going to be a great fall, and there really was a rise. Can you at all explain that?—I should think very likely it is owing to the eastern provinces of China being freer from rebel raids, and the greater facility for trade, and of carrying it into the interior. The western opium crop, of course, would not, and I may say that it does not interfere with the Indian drug at present, but that it may do is probable.

5576. You think, on the whole, that if our Indian opium revenue falls off considerably it will be simply through our own bad management?—I think so, entirely.

5577. *Sir Wilfrid Lawson.*] In regard to what you said about the people dying if the opium consumption were cut off, I suppose that if the consumption were stopped under favourable circumstances, if they were not poor, wretched, half-starved people who lived on nothing but opium, but if they had other good food beside them at the time when their consumption of opium was cut off, you would not anticipate any great mortality among them?—Yes; the mortality would be quite the same. A great number of cases go to the native hospitals erected at Hankow, Shanghai, Canton, and other places; and very bad opium cases are occasionally recovered by European medical treatment, that is to say, other stimulants are given to keep up the body until they recover strength; but it is rarely that they recover.

5578. But you are quite convinced that, in the case of confirmed opium smokers, the stopping of their consumption of the opium would make them in every way worse physically than they were when they went on with the opium?—Yes; a man who smoked opium for five years, and who

dropped the opium, would simply die; he could not work, he would die of inanition.

5579. As far as you could learn, was the country what we should call better and more prosperous, a generation or two generations ago, before this great consumption of opium coming into fashion; was there less poverty and were the people better off?—No, I do not think so. I think that for several generations the Empire of China has been suffering from a plethora of population in many parts. In Szechuen they have had an enormous population, and also in Yunnan, that has been cut off by the Mahomedan rebellion. A good many of the eastern provinces, where opium is extensively smoked, have been suffering from enormous populations, and there has been great poverty. I do not think that opium smoking is really the cause of all the great poverty in China. The effects are very bad and lamentable, but I do not think that it is all due to opium smoking.

5580. You think that the country would be better without it? I think so, undoubtedly.

5581. But there is every prospect of the consumption increasing, you think?—It is sure to increase; it must do so.

5582. Then in that case, as they spend so very much of their wages on it now, of course we cannot hope for any great increase in any other kind of trade with China?—I do not think that it will affect the piece goods trade in China at all. The only fear I see in Western China is of a shortness of the staple article of food, namely, rice. If we allowed the native drug to compete with the Indian drug and find a valuable market, then the Western Chinese might cultivate opium, at the expense of their rice crop, for sale; and in that case the misery would be such, that you cannot contemplate the results of such a step; the poverty of the people would become horrible.

5583. Is not it the case now, in the eastern parts, that they cultivate it at the expense of their rice crops?—To a certain extent; but I have already said that there is not such a great deal of opium cultivated in Szechuen. Yunnan is the great opium field; because even the people of Szechuen themselves like the Yunnan opium in preference to their own.

5584. There is no hope of the state of things with regard to opium getting better, I suppose, as far as you see, but there is every prospect of the consumption going on increasing?—It is hopeless to think of stopping the consumption of opium if the Chinese are left to themselves; and I should say that like every other vice it will increase, especially with a people so peculiar as the Chinese; to what extent it may increase I cannot say.

5585. *Mr. Birley.*] Can you state what is the general opinion of European medical men as to the effect upon the constitution of the Chinese of this extravagant consumption of opium. When they are called in in cases of disease do they find the constitution particularly affected and debilitated by it?—I cannot speak with certainty as to whether I have heard medical men express any opinion about it; I may say that the widespread opinion among Europeans in China is, that opium does debilitate the constitution. My own experience, as I have said, shows me that unless the man is deprived of opium after being accustomed to it his constitution suffers very little.

Mr.
T. T. Cooper.
23 May
1871.

Sir HENRY BARTLE EDWARD FRERE, K.C.B., G.C.S.I., recalled; and further Examined.

Sir H. B. E.
Frere, K.C.B.,
G.C.S.I.

23 May
1871.

5586. *Chairman.*] I THINK you are acquainted with the steps that have been taken by the Government of India to regulate the customs revenue for some years past?—Yes.

5587. Will you be good enough to inform the Committee what has been the course of legislation in that respect since a general system of customs was introduced by the Government of India?—I think up to the year 1846 there were considerable variations of the practice of the different presidencies, though the customs laws were nominally nearly uniform. About that time, in a Despatch dated the 22nd of April 1846, in consequence of the Report of the Committee of the House of Commons upon cotton cultivation, an implied pledge was given by the Court of Directors that several customs reforms should be carried out. These customs reforms embraced the abolition of export duties except the duties on indigo, and the abolition of the port to port duties, the coasting duties, and, thirdly, the abolition of double duties on foreign bottoms. Both the latter reforms, the abolition of the coasting duties and the abolition of double duties on foreign bottoms, were carried out a couple of years afterwards.

5588. Were the customs duties reviewed subsequently to that?—Yes, they were reviewed in 1857. On the 23rd of February, Lord Canning as Governor General, asked the Court of Directors to state their general views regarding customs duties, and begged that if the court had no particular views to state, his Government, the Indian Government, might have leave to prepare a general scheme of customs for all India, with a view to compensate for the relinquishment of what were called the *Moturpha* duties, duties on trades and professions in the Madras territory, which had not been relinquished in Madras at the time that they were abolished in the rest of India, and also with a view to reducing the salt tax in Bengal. Among the further reforms which were suggested in the same Despatch of 23rd February 1857, it was proposed to equalise duties on British and foreign manufactures, and also the duties on manufactured and unmanufactured goods; secondly, to exempt a great number of small articles which produced a very trifling amount of revenue each; thirdly, to abolish the export duties, and, fourthly, to augment the import duties. All these suggestions were offered just before the mutiny broke out, and for a time the mutiny suspended all further discussion on the subject; but two years afterwards, in consequence of the financial embarrassment caused by the expenditure in the mutiny years, on the 7th of April 1859, Lord Stanley wrote to the Government of India and pointed out the necessity for increasing the revenues of India, or reducing charges in order to cover the financial deficit. He observed that as all economies must be very tedious in operation it was desirable in the first instance to augment the revenue, and he devoted this despatch to the consideration of the customs. After reviewing the former course of correspondence on the subject, he directed that the Government of India should hold their hands as regarded anything that would cause a reduction of income; and with regard to the four propositions which were submitted by the Government of India in the Despatch of the 23rd of February 1857, Lord

Stanley directed that the duties on British and foreign manufactures, and on manufactured and unmanufactured goods, should be equalised by raising the duties on British goods to foreign rates. He also directed that drawback should be abolished, and that a difference should still be maintained between partially and wholly manufactured goods. The second proposition, to exempt from duty those articles on which the amount of revenue received was very small was negatived, and the proposition to abolish the export duties was also negatived; and an increase of the export duties was directed in some cases, especially on indigo, and shellac, saltpetre, borax and one or two articles in which it was believed India had a practical monopoly of the market. With regard to the import duties, he directed that they should be raised to $7\frac{1}{2}$ per cent. on raw produce, and on half-manufactured goods; to 10 per cent on manufactured goods of most descriptions, and 20 per cent. on luxuries. These are merely the general features of the Order.

5589. Were any steps taken by the Government of India consequent on that despatch?—Yes; shall I mention the conclusion of Lord Stanley's Despatch?

5590. If you please?—He directed some reforms in the way of substituting fixed rates on weights and measures, instead of a charge *ad valorem*, and he calculated that these measures would give the Government of India about 75 lacs of rupees, or three quarters of a million pounds sterling more revenue. At the end of the Despatch, he acknowledges the letter of the 5th of February 1859, from the Government of India, which generally agreed with the views which he had expressed. Then on the 14th of March 1859, the Government of India wrote a letter which crossed this Despatch of Lord Stanley's and forwarded Act 7 of 1859. This Act raised the duties very much to the pitch directed in Lord Stanley's Despatch; and there was a clause inserted in the Act which gave power to add the increased duty to current contracts which had been made under the old law, so as to throw the increased duty on the buyer. On the 26th of March in that year, 1859, a very strong remonstrance was made by the mercantile community in Bombay; in fact, there was a very considerable feeling expressed throughout the whole of India on the subject of this customs measure.

5591. When you say "expressed throughout India," do you mean by the natives or by the Europeans?—Chiefly by the Europeans. And a memorial from the Chamber of Commerce in Bombay was forwarded by Lord Elphinstone's Government, pointing out that the action of Act 7 of 1859 would be very much to derange their trade, and that the retrospective clauses would be practically inoperative, owing to the number of hands through which a great part of the trade, especially the piece goods trade, passed; and they suggested that instead of this customs measure, measures of direct taxation of incomes, which did not pay other taxes to Government should be considered, and also some measure for payment of a stamp duty on bills of exchange, and on cheques, and, thirdly, a succession tax. These papers were forwarded to the Government

vernment in England; and on the 25th of May 1859, Lord Canning's Government acknowledged Lord Stanley's letter, and pointed out that the orders received had in effect already been carried out, except that the duty on cotton yarn was only 5 per cent.; that 10 per cent was levied on unwrought metals, and duties rather higher than Lord Stanley had proposed, on beer, tobacco, and spices. On exports no increase was levied, except on grain, and for special reasons reduced duties, or duties lower than Lord Stanley had contemplated, were levied on raw silk and tobacco. Subsequent to this period, Mr. James Wilson went out as financial adviser to the Government of India, and one of the points to which his attention was particularly directed, was to meet the objection; and irritation which had been excited by these very heavy customs duties. On the 29th of June 1860, the Governor General in Council, addressing the Secretary of State, replied to the objections which had been brought forward by some of the mercantile bodies, and pointed out that the duties had been altered, and that whereas the duties stood in 1859 as follows: on yarns, 5 per cent.; on piece goods, 10 per cent.; on haberdashery, millinery, and hosiery, and articles of luxury of that kind, 20 per cent.; in 1860 these duties were all uniformly fixed at 10 per cent. But it was observed that the objections of the mercantile community appeared to refer rather to a new tariff of valuations, the operation of which very materially modified the bare letter of the customs law.

5592. I think in the Act of 1859 the views of Lord Stanley in levying the duties on the quantities, and not on the value, were not carried out; it was still an *ad valorem* system, except as regards spirits and liquors?—Yes, I think it was generally *ad valorem*; and the despatch of the Government of India observed that they found, on reference to Bombay, that there were very great discrepancies in the practice of the three Presidencies, especially as regarded the tariff of valuations on which duties were levied, and that they had, therefore, ordered a general committee to assemble at Calcutta to fix a uniform tariff of valuations for all India, or to consider the possibility of it. These observations were directed to meet the objections which had been made by mercantile bodies, both in India and in this country, but they were addressed to the Secretary of State; it was also pointed out that trade was much depressed by cholera in the interior of the country, and letters were enclosed from the Bombay Government, and from Mr. Spooner, who was a very experienced Commissioner of Customs at Bombay, and who pointed out that in Bombay the merchants had always been taken into council with regard to the fixing the tariff of valuations, and that in consequence the Bombay tariff was a better and more business-like one than that at Calcutta.

5593. That is to say, the valuations in the tariff?—Yes, the price list; then, in June of 1860, a committee was appointed at Calcutta, consisting of Mr. Spooner, from Madras and Bombay, Mr. Bullen, a merchant of Calcutta, to represent the mercantile community, and Mr. Ashley Eden, who is at present acting as Commissioner in Burmah, and who was then Secretary to the Board of Revenue in Bengal, on behalf of the Bengal Government; and they forwarded a Report on the 26th of October 1860,

0.59.

submitting for sanction a uniform tariff, with some important customs reforms, and many suggestions for customs reforms; and since that period there has been much more uniformity of practice throughout the customs administration of all India. In 1867, on the 7th of January, there was a Report by a second tariff committee, consisting of Mr. Bellasis, to represent the Government of Bombay, Mr. Hunter Blair, to represent the Government of Madras, Mr. Crawford, to represent the Government of India and the Bengal Government, and Mr. Schiller, a merchant of Calcutta, to represent the mercantile community, with Mr. Lane as secretary; then they submitted a further revised tariff of valuations, calculated to meet the changes in prices which had occurred since the last tariff committee reported.

5594. What was the result of their labours?—Generally, I think, there had been a great rise in prices, but very considerable variations in most of the articles; they submitted a new classification of articles, and a very considerable reform, which cost very little, by putting a number of petty articles on the free list: instead of enumerating the free articles, and leaving all others dutiable; they enumerated the dutiable articles and left all others free; they submitted suggestions also for altering the duties on wines; for reducing all dutiable articles to 97 imports, and nine exports, with an extra duty on grain in order to make up for the loss. Mr. Crawford recorded a dissent from both these suggestions; he concurred in the report, but he dissented from both suggestions, and gave very powerful arguments to support his dissent; on the 19th March 1869 there was another tariff of valuations; and in 1870 Act 17 was passed; it fixed the import duties generally on this footing (I give merely very generally the features): $7\frac{1}{2}$ per cent. on manufactured goods and raw material; $3\frac{1}{2}$ per cent. on twist; 5 per cent. on piece goods; 1 per cent. on iron, and 10 per cent. on tobacco; and on exports, the principal duties were 3 rupees a maund on indigo; 3 annas a maund on grain; 4 per cent. on lac, and 3 per cent. on oil, seeds, cotton goods, hides, and spirits.

5595. Has any change been made since then?—Since then the present customs duties are fixed by Acts 13 and 14 of 1871; they have only just been received, and they embrace the law as it is now.

5596. Do those Acts contain now the whole of the import and export duties for India?—Yes.—(*The Acts were handed in, vide Appendix.*)

5597. I see there are both the value on which duty is assessed, and the rate of duty stated in the Schedules to the Act?—Yes.

5598. Is the duty to be levied on the "rate of duty," or on the previous column?—Besides the Act which fixes the rates of duty leviable, there would be from time to time a tariff of official valuations of dutiable articles which would guide the levy of the duty.

5599. This Act repeals all the former rates, and various duties then existing?—Yes.

5600. Is this Act in the present year based on any new principles, or is it a mere correction of details of the former duties?—Generally there have been considerable reductions in the duties; not to any great extent during this present year, but the general result has been that from 10 and 15 per cent., which were the rates formerly prevailing, duties have been lowered to $7\frac{1}{2}$ and 5 per cent.,

Sir H. B. E. cent., which are now the general rates of import
Frere, K.C.B., duties.

G.O.S.I.

28 May
 1871.

5601. Have you any papers which will enable you to state the amounts which have been levied from customs for the revenue, under the different systems that you have described?—I could give from these papers, which have been previously laid before Parliament, the total amount of customs duties for a great many years past.

5602. Would you now state them, with reference to the dates fixed for the changes of the system, what was the amount when first the consolidation was begun?—I think about 1816 was the time; it is given here, "receipts, charges, and net receipts."

5603. Can you state the gross?—In 1846-47 the gross receipts in Bengal were 771,970*l.*; in the North Western Provinces, 136,578*l.*; in Madras, 151,040*l.*; in Bombay, 307,137*l.*; there was a total charge for collection of 186,036*l.*, and a net customs revenue of 1,180,689*l.*

5604. Without going into the details of the several presidencies, what was the total gross amounts in the next period?—In 1856-57, customs, exclusive of salt (they are given in this general abstract statement of revenues and charges of India for 15 years), amounted to 1,197,897*l.* gross. Then I think the next year would be 1859-60, the gross revenue then was 3,203,515*l.*; then in 1869-70, it was 2,429,185*l.*; and this table, which I am about to hand in, gives the customs, exclusive of salt, for 1869-70, in each presidency, with the expenditure; the gross amount is 2,429,185*l.*, and the expenditure is 181,456*l.*, leaving a net income of 2,347,729*l.*

5605 Mr. J. B. Smith.] That is not the estimate?—No; the actual.—(*The Table was handed in, vide Appendix.*)

5606. *Chairman.*] Have you anything more to add on the subject of customs revenue; do you wish to make any suggestions on the subject?—Only that it seems to me that the duties now are almost as low as is consistent with any hope of getting considerable revenue from them; the present Government of India seems fully alive to the necessity of carrying out such reforms as have been suggested, in the way of exempting articles which yield very little revenue, but their hands are tied at present by their financial difficulties: the only reform that seems to me extremely desirable (and even for that it would be necessary to wait till their finances were easier) would be the abolition of the export duties; and that is a reform which, I think, might be carried out probably with very little loss of revenue; because, with regard to a great many of these export duties, such, for instance, as the export duty on grain, besides the general objections which apply to it, your circumstances in India give you a very considerable share by the increase in your land revenue, of any increased production of grain, which might be the consequence of the export duties being removed; it has been suggested on rather high authority lately, to abolish customs duties altogether in India, but I must say that seemed to me, rather a millennial sort of reform, which would be very desirable in itself, but was not to be practically considered at a time when you are not in a position to give up 2,000,000*l.* of indirect revenue.

5607. Have you the amount of revenue derived from each of the principal articles last year?—I will have a return prepared, and hand it in.

5608. Having regard to the considerable re-

duction that has taken place in the gross amount of customs duties, do you think it would be impossible to bring the customs duties back again to the amount that they formerly realised?—There is this difficulty, that the interests of India and of England on that point seem rather at variance. No doubt some considerable increase of revenue might be realised by increasing the import duties, say, upon piece goods and yarns, but the direct result of that would be to diminish consumption and to stimulate production on the spot, and of course it is not desirable if you can avoid it, to increase duties upon necessary articles of clothing; in one sense it is quite for the benefit of the Indian tax-payer that the poorer classes should get their clothing in the cheapest possible markets, and materials for clothing are not among the articles which, if it could possibly be avoided, you would select for taxation.

5609. Do you think there is any great amount of contraband importation into India at the present time?—I should think that under these low duties there was not much room for smuggling.

5610. Do you think that there was much smuggling when the duties were higher?—Undoubtedly there was. Some set-off against the abolition of export duties might be found in a system of stamps, possibly, which might enable the Government, by levying a stamp duty, to declare exports free, with a less sacrifice of revenue, than they could do without some set-off; but that, of course, is a question always of balance of advantages.

5611. Have you any reason to think that the export of commodities would be increased in quantity if the export duties were removed?—I have no doubt of it. The saltpetre trade was entirely strangled by the export duty upon saltpetre, and I have no doubt that the indigo trade is in considerable danger from the same cause. Formerly, both saltpetre and indigo were almost monopolies of India. Saltpetre was produced in other countries, and particularly on the Continent; and in Belgium they discovered the means of making it artificially, which was so much stimulated by the very high duties imposed on saltpetre that they got to make the artificial saltpetre very cheaply, and the trade in the natural saltpetre was very seriously injured, and probably will never recover. In the same way the high duties on indigo stimulated competition in Java and other countries, and though they have not got native indigo at all equal to Indian indigo, between artificial dyes and the improved indigo of other countries, the indigo of Bengal will probably be run rather close. In the same way the rice duties in Burmah no doubt put the Burmese export grain trade at a great disadvantage as compared with Siam and other great rice producing countries which are close at hand.

5612. Do you know whether any drawback is allowed on export from Burmah to Bombay, or any other part of India, on grain or other commodities on which duty has been paid?—I am not sure how that is.

5613. You do not know what the present law is with reference to the import into one part of India of any commodities for which an export duty has been levied in another part of India?—There is no port to port duty in India now.

5614. Would grain from Burmah to Bombay be free of duty?—I am not sure; I will ascertain that. But Burmah is differently treated with regard

regard to its grain duties from the rest of India, I think.

5615. Do you know why that is?—No; I am not aware that there is any good reason for it. There is the reason that there is a considerable export grain trade which there is not elsewhere.

5616. Has it any reference to the desire to levy a tax upon the grain grown in the territory of the King of Burmah?—No; there are frontier duties which would secure any object of that kind without the intervention of the sea customs.

5617. Mr. Crawford.] I see that the recent Act applies to British India; what is the definition of British India?—All India under the Government of the Governor General.

5618. Including Burmah?—Including British Burmah.

5619. And Aden?—Yes.

5620. I suppose that notwithstanding the difference of circumstances in the extensive region over which British India extends, a uniformity of duty is necessary unless you introduce a system of duties upon transport from one port to another?—Yes, I see on reference to the Act that with regard to the Burmese duties I was clearly wrong just now; grain of all sorts is subject to an export duty of 3 annas per maund; that would be invariable on all exports from all Indian ports, to all ports out of India.

5621. Then a duty would be levied upon grain exported from one Indian port to any other Indian port?—No, because these duties are leviable only on exports out of British India.

5622. Have you any return by you of the proportion of the total receipts which are derived from the export duties as distinguished from import duties?—Yes, they could be given. I have here the gross amounts for all India.

5623. What is the whole amount derived from the export duties for the whole of India?—£. 530,509.

5624. Could you furnish us with an account of the sums provided by each separate article?—Yes.

5625. I think I understood you to object upon broad principles to the imposition of an export duty?—Certainly; it seems to me to be in every sense a duty which you can only justify on grounds of pressing necessity.

5626. Was it not upon that ground that Mr. Crawford in Calcutta dissented from the other Commissioners?—Yes; I could read you his dissent if you would like. He says, "With regard to the extra duty on grain, my objection is based first on the ground that all export duties are indefensible except under the direct necessity of the State. They are contrary to the principles of political economy, and holding this view I cannot recommend that a certain amount of wrong having been already done to the trade of the country by existing export duties, a further wrong should be perpetrated by adding to the export duty in grain."

5627. Do you concur in those remarks?—Certainly.

5628. He was opposed in that view by the other Commissioners?—Yes, he was alone.

5629. He was opposed by Mr. Bellasis, who represented the Government of Bombay, and by Mr. Hunter Blair from Madras?—Yes; it had been remarked that the greater part of the grain exported was consumed in Mauritius, and in other countries, where an import duty was levied on it, and that the only effect of the export

0.59.

duty being remitted, would be that the import duty at the Mauritius, and in other places, would be raised. To that Mr. Crawford answers, "If the governments of other places are ill-advised enough to put heavy import duties on certain articles, I do not see that we are bound to retaliate by also putting a heavy addition to the export duty here."

5630. Do you agree with him in that?—Entirely.

5631. Do you know what duty is charged upon the importation of grain into Ceylon?—No; I believe it is one of the principal items of customs revenue there.

5632. And is an export duty charged upon the grain going out from the Indian ports to Ceylon?—Yes, it would be chargeable.

5633. You were referring just now to the article of saltpetre; is it not the case that the export duty was very much augmented in the time of Mr. James Wilson?—Yes.

5634. And is it within your knowledge that great objection was taken to that in this country, both in Parliament and out of Parliament?—Yes, and it was very much discussed in the Government of India at the time; I was afraid that the results would be what they have been, and I stated my objection at the time; but it was based rather on a theoretical opinion as to the certainty of chemistry in the long run effecting anything that was possible in the way of manufacture, rather than upon any proved fact; I have no doubt that if Mr. James Wilson had lived this duty on saltpetre would have been very speedily removed.

5635. It was based on the false assumption that India was the only source from which supplies of saltpetre could be obtained, or supplies of any article equivalent to saltpetre, for the purposes of commerce?—Yes.

5636. And is it not the fact that the effect of that was to stimulate chemical ingenuity in some parts of Europe, and to cause the introduction of an article which has superseded, to some extent, saltpetre?—Yes.

5637. And I believe that that was the direct consequence of the price of saltpetre being enhanced by the imposition of this heavy export duty in Calcutta?—The attempt to manufacture saltpetre on a great scale, artificially and cheaply, had been made before in Belgium. Of course it was very much stimulated by the additional export duty.

5638. Saltpetre is a natural product of the soil, is it not, to a great extent?—Yes; in India it is a natural product of the soil, whenever there is a certain amount of animal matter mixed up with the ordinary soil of the district, and it is found in any place where there are old ruins, or former habitations, or where there has been much animal life formerly.

5639. The duty on saltpetre in India now has been altogether withdrawn; it is free, is it not?—Yes; the only articles now subject to export duties are cotton goods, grain of all sorts, hides and skins, indigo, lac, oil seeds, and spices.

5640. Do you know whether the removal of the duties has had any effect in reinstating the export trade from Calcutta of saltpetre?—I have not heard what the effect has been.

5641. With regard to indigo, is it not the fact that there is a very large production of indigo now in Central America?—I believe, in Central America and Java; and also great efforts have been

Sir H. B. E.
Frere, K.C.B.,

1871.

Sir H. B. E. been made to produce it in the West Indies, in
Frere, &c. &c., Jamaica, and elsewhere.

G.C.S.I.

23 May
1871.

5642. The effect of the duties is, *pro tanto*, is it not, to place the Indian production at a disadvantage as compared with the indigo that is brought from Guatemala to this country, which pays no duty?—Yes; I have understood also that some of the chemical dyes lately invented are likely to interfere seriously with the use of indigo.

5643. I am told that the effect of the export duty bears very heavily on the lower qualities of indigo manufactured in the Madras Presidency; have you heard that?—Yes; it certainly bears much more heavily in proportion to the low quality of the dye.

5644. That indigo being already subjected to a heavy charge as regards its value, in the form of the tax paid upon the land upon which the indigo is cultivated?—Yes, of course; like any other agricultural produce, the raw material pays tax.

5645. Then again, in the article of hides, I see that an export duty of 3 per cent. is charged upon hides; I believe the trade in hides from India has been a very largely increasing trade?—Yes; it is the growth of late years entirely, I believe, or almost entirely.

5646. And those hides, of course, have to come into competition in the markets of Europe with the hides from the South American Atlantic States, which pay no duty here?—Yes; and from Australia.

5647. And the removal of the export duty in India would, as regards the hides brought to this country, have placed them in a position for better competition with regard to hides from other countries?—Yes.

5648. In fact, broadly speaking, these export duties levied to so large an extent upon Indian productions are, so far as they go, very much against the extension of the export trade of India?—Certainly.

5649. Mr. Bowker.] With reference to those articles that are exported which are not now subject to export duty, is there an account kept of them?—Yes; a statistical account.

5650. At all the ports?—Yes.

5651. Mr. Beach.] With regard to the Moturfa tax, that existed only at Madras, I think?—It was a universal tax up to 35 years ago; it was then reduced throughout India, with the exception of Madras, where it was larger in proportionate amount than elsewhere, and it was temporarily retained there until an equivalent could be found for it, and the proposition of the Government of India in the early part of 1857 was directed to finding an equivalent to enable them to reduce the Moturfa tax.

5652. Were there serious objections entertained to the Moturfa tax?—It was a rather clumsy and antiquated tax on trades and professions.

5653. And the customs duties to some extent are a substitute for it?—It was intended in 1857 to slightly raise the import duties in order to enable the Government of India to get rid of the Moturfa duties; it was supposed that a measure of that kind would, upon the whole, be for the benefit of the country.

5654. But was it popular amongst the people; were they not inclined rather to pay the Moturfa tax, to which they were used, than to pay increased duties on articles of consumption?—It

could not be said to be popular; it was not much objected to, because it was an old tax to which they were accustomed; it had been an almost universal tax in all ages in India.

5655. The present rate of import duty does not interfere seriously with the consumption, in your opinion, does it?—Of course any import duty, however light, must interfere with consumption, both directly by the additional price, and indirectly by the delay, and a certain obstruction to trade inevitable at any custom house; but beyond that it seems to me that the rates of the present import tariff are almost as low as you could have them, if you intend to get any revenue at all from customs.

5656. Mr. Lyttelton.] We have had contradictory opinions as to the extent to which the great mass of the population share the burdens caused by import duties; what is your opinion on the subject as to the poorer classes, who are the great mass of the population, I suppose?—A great part of their clothing pays import duties; I should say that the poorest native of India paid occasionally import duties upon his clothing and upon such few articles of luxury as are used in the shape of spices and sugar and beads, and things of that sort.

5657. And no class you think is too poor to be able to purchase such articles as foreign-made cloth?—Hardly any so poor. There are still considerable districts of India where most of the cotton cloth is of native manufacture, but, generally, the English manufacture is driving out the native throughout the country.

5658. Do you think that, on the whole, that is beneficial to the country?—It cuts both ways. It gives them abundant and cheap clothing, but probably the clothing is not so substantial, and their being clothed by a foreign country sacrifices a certain amount of native industry. However, of late years there has been a very considerable increase of power-loom production in India itself.

5659. We have been told by witnesses from several quarters of India that the salt tax is the only means of taxing the mass of the population. Is your acquaintance with India so general as to enable you to say how that is?—It is one of the most effectual ways of reaching every head of the population, but I have no doubt that there is a very small proportion, and a decreasing proportion, of that population of India which does not in some way or another contribute to customs. Of course it is very difficult where the country is so large, and produces such a great variety of products within itself, to reach all the articles which you would wish to tax through the medium of sea taxing.

5660. As to export duties, I understand that your objection to the present export duty is this, that there is no article of which India is so complete a monopoly as to be able safely to bear an export duty?—Yes.

5661. You would have no objection if there was such an article to put an export duty on it, I presume?—No, I think it would be theoretically a perfectly defensible export duty, but I know of no such article.

5662. I thought you mentioned three or four, amongst them, shellac and borax, of which you said that India had a monopoly?—Borax is perhaps as nearly one of those articles as possible, but still borax is produced to some extent in Italy, to some extent in Chili and it reaches England

England also through China from the borax mines in Thibet, which supply the Indian borax.

5663. No other articles appear to you as susceptible of an export duty in regard of there being a monopoly of them?—I know of none.

5664. Not timber, for instance?—Every kind of Indian timber is run more or less closely by timbers of similar qualities from other countries.

5665. Mr. *Grant Duff*.] I suppose, with regard to the customs your general policy would be to get rid of the export duties as soon as possible?—I think that is the policy of the present Government of India, and a very sound policy.

5666. Would you get rid of them altogether, or only partially?—I would get rid of them altogether, because there is a very great practical benefit in a customs house, in your exports being altogether free, and examined no further than is necessary for statistical purposes.

5667. And, no doubt, if we ever arrive at that millennial period of which you spoke, you would be willing to sweep away the import duties also?—Yes; but only when, in some way which I can hardly imagine, you get a very considerable amount of indirect taxation by some other means.

5668. Which would you begin with; which duty would you sweep away first?—I think that the course which has been adopted in this country is the sound one, dealing first of all with articles which enter largely into manufactures, and then such articles as enter into building, and clothing, and the materials which are most in use among the largest number of our population. But, as a matter of policy, it seems to me that a tax is to be recommended, I mean as a mere Treasury question, partly because it reaches large numbers, and that when it does reach large masses you have two conflicting motives in dealing with articles which are articles of prime necessity. In one point of view, for instance, a duty on salt, or on clothing, would be very objectionable, it becomes virtually a poll-tax. In another point of view, as a mere matter of revenue, it is one of the best duties that you can have, because it reaches such a large proportion of your population, and consequently is so productive.

5669. I think your attention has been called to one or two answers that were given the other day by Sir Robert Hamilton; I will read the questions and answers to you, and ask your opinion about them. Sir Robert Hamilton was asked this question by the Honourable Member for Stroud: "Supposing Holkar was to raise 300 rupees a chest in addition to what he now does, we must reduce our duty 300 rupees a chest, must we not?" And he replies, "It would be a question between him and the Government." What would you say with regard to that?—I should say not; Holkar can only levy on opium the difference between our duty, whatever we choose to levy at the door of his territory, as it were, and the extreme sum which opium can afford to pay.

5670. And that is exactly what he does levy?—Yes; that is exactly what he does levy.

5671. Then the honourable Member proceeded to ask: "We should, in fact, prevent his levying any duty that would interfere with our revenue: we should take care that all the revenue from opium comes to our Exchequer?" To which he replied, "That we should not be losers." What would you say with reference to that: would you say that that was a fair way of expressing the attitude the Government have

taken?—No, I think not; I think that the Government has always considered that they deal with the opium duty as one simply concerning their own Exchequer and the trade in China, and without any special reference to Holkar. As far as I am aware they have always regarded him as the landlord of the territory in which this article is grown, and they have not specially considered whether their dealing with the opium revenue affected him beneficially or otherwise.

5672. But you do not consider that the Government has done anything that could in any way be represented as unfair or harsh to Holkar?—Clearly not.

5673. Then my honourable friend asked, "There is no existing treaty or anything of that kind which prevents Holkar from levying a higher duty?" to which Sir Robert Hamilton replied, "No; but a treaty might be construed into that, perhaps;" you would not say that that is a fair description, would you?—I am quite sure that that is a view that never could be taken by the Government of India.

5674. Sir *C. Wingfield*.] You say that Holkar could only levy the difference between the rate of duty fixed by the Government per chest, and what opium could bear relatively to the cost at which it is produced?—Yes.

5675. But why is he restricted to that limit; what is there to prevent him from putting on a duty of 200 or 300 rupees a chest?—Because, if he did it, he would strangle the trade.

5676. He is not bound by treaty, is he, to consider our tax upon opium, in putting his duty upon the opium?—No, but practically that would be the effect; I will give an instance; supposing that we levy 500 rupees a chest, and that the utmost that the chest will bear without stopping the trade altogether is 600 rupees, Holkar's powers of taxation are practically limited to that of 100 rupees.

5677. That I perfectly understand, but as an independent prince, and not restricted by any treaty, why is he bound to consider our opium revenue?—Simply because we have got the door of his territory.

5678. *Chairman*.] Is there no convention respecting the opium?—There is a convention which enables us to levy a pass duty at Indore, in his territory as a matter of convenience, to prevent our having to levy it on the road between him and Damaun; but that was merely a matter of administrative facility, not with any reference to what he was making from the opium.

5679. Sir *C. Wingfield*.] But supposing him to be an independent prince, as independent as the King of Nepal is; we could not constrain him to submit to this imposition of duty if he was opposed to it, could we?—I do not imagine we should dream of constraining him; we should simply say "You may levy what you please, we also shall levy what we please;" and, practically, as we have got the road to the sea and the seaboard, he is in the position that I have described.

5680. Then I understand that by controlling the channels of exit from the territory, and by having the command of them, we put him in this position, that if he was to levy a heavy duty, and we at the same time continued to levy ours, practically no opium could get out of his territory?—Precisely so; you have the turnpike roads leading from his estate, and you do not interfere with what happens in his estate, further than to levy your turnpike tolls.

Sir *H. B. E. Frere*, K.C.B.,
G.C.S.I.
23 May
1871.

Sir H. B. E. 5681. Then the position of his territory con-
Frere, K.C.B., strains him to submit?—There is no submission,
G.C.B.I. 5682. We might, if it suited our purpose, put
 23 May on so tremendous a duty as practically to preclude
 1871. all exportation of opium from his territory alto-
 gether?—Clearly.

5683. Mr. *Lyttelton*.] So could he, could he
 not; the trade is practically at his mercy?—
 Clearly he might do it if he liked.

5684. Mr. *Grant Duff*.] But he has a distinct
 gain from every chest of opium that passes?—A
 very great gain, and it is a most profitable culti-
 vation in itself.

5685. In short, he makes the best of his natural

advantages, and we make the best of ours, that is
 all?—Clearly so.

5686. Sir *C. Wingfield*.] Except so far as this,
 that if we would lower of our duty on Malwa
 opium he would be a gainer by it, because he would
 put on so much more?—He might do so.

5687. Mr. *Lyttelton*.] Do you know whether it
 is found by experience that a rise or fall in our
 rates is followed by a rise or fall in his rates?—I
 am not sure whether that has been observed at
 all.

5688. He only gets 10 rupees a chest, I think?
 —Yes.

Sir RUTHERFORD ALCOCK, K.C.B., called in; and Examined.

Sir 5689. (*Chairman*.) You are Her Majesty's Re-
R. Alcock, presentative in China?—Yes; I am Her Ma-
K.C.B. jesty's Minister there.

5690. You have resided there for some years,
 I believe?—For a quarter of a century.

5691. During that period have you become
 acquainted with the circumstances under which
 opium is either produced or consumed in China?
 —In the last year or two my attention has been
 very pointedly directed to both by the uneasiness
 of the merchants engaged in the trade as to the
 cultivation of the poppy in China; and in con-
 sequence of that, I took steps to inform myself
 as far as possible, and to get all the information
 that I could.

5692. Will you kindly state to the Committee
 what was the result of that information, or the
 character of it?—I think, perhaps, it will save
 the time of the Committee, if you will allow me
 to first give a statement of what were the general
 conditions I found existing there.

5693. Can you state what were the conditions
 as regards the cultivation?—As regards the cul-
 tivation, and its bearing upon the trade, as
 well as the influences bearing upon both in refer-
 ence to the political condition of China. As
 I have mentioned there was very general uneasiness
 felt among the chief mercantile houses
 in China towards the end of 1868, and Messieurs
Jardine, Matheson, and some other firms had a
 reference made to me to know whether I could
 ascertain for them how far the reports were true,
 that there was a large and increasing cultivation
 of the poppy; upon which I took what steps were
 in my power, and sent a circular to the different
 consuls, in order to obtain, on the spot, informa-
 tion from native sources. The trade for the three
 or four years preceding; I learnt from the mer-
 chants, had been a losing trade, and the demand
 for Indian opium seemed to have been checked;
 that is to say, its progressive increase, which had
 been very remarkable for many years before,
 seemed to be stopped, all of which pointed to
 some cause that was interfering either with the
 consumption or with the demand for it. In Jan-
 uary 1869, one of the censors, *Yuen-ho-chuan*
 by name, memorialised the Crown, requesting that
 the cultivation of the poppy might be prohibited.
 (These censors call everyone, from the emperor
 down to the lowest official, to account, if they
 find anything contrary to the laws or traditions
 of China.) In consequence of this, there was an
 edict which appeared in the "*Pekin Gazette*" of
 the 29th of January, referring to this memorial,
 praying for prohibition, and to previous edicts

to that effect, enjoining the high officers and the
 magistrates in the provinces to enforce the prohi-
 bition against the cultivation of opium in the sense
 which the censor had demanded. I can show
 hereafter the terms in which he spoke of the cul-
 tivation of the poppy, and of the injury which
 opium did to the nation; giving, in fact, the Chinese
 view of the trade. On the 16th of February, I sent
 a despatch to Lord Stanley on the cultivation and
 taxation of opium, with various enclosures. It
 was sent to the India Office, and also to Calcutta;
 and I should be very glad if you would permit
 me to read two or three passages from it, because
 they will show in what state our information was
 at the beginning of 1869, when my attention was
 most pointedly directed to it. I began by saying,
 "Some anxiety having been expressed by ship-
 pers of opium from India, as to the increased
 growth of the drug in China, and a desire con-
 veyed to me through Messrs. *Jardine & Mathe-
 son* for information, I addressed a circular to
 Her Majesty's consuls, directing them to furnish
 me with all the data they could collect. Mr.
Consul Medhurst will have already transmitted,
 by my direction, copy of his Report, and I now
 have the honour to enclose one from Mr. *Lay*,
 at *Kiukiang*. In the notes furnished by Mr.
Cooper some further information will be found, as
 regards the extent of cultivation in *Szech'uen* and
Yunnan, and the causes of its increase; also, in
 the enclosed accounts drawn from the local press.
 It appears that the native drug is not only far
 less costly than the Indian (one-half the price),
 but greatly preferred by the Chinese, for the
 same reason that they prefer their own tobacco
 leaf, as less potent in its effects and consequently
 in all probability much less injurious. If Mr. *Med-
 hurst's* information is to be relied upon, nearly two-
 thirds of the rich and fertile Province of *Szech'uen*
 is under opium cultivation and one-third of *Yun-
 nan*; opium, in such cases, taking the place of the
 natural products of the country, of rice, silk, corn,
 sugar, &c." Then I go on to say: "It is not
 surprising, therefore, that the Chinese Govern-
 ment, by the issue of a prohibitory decree, of which
 translation is enclosed should make some effort,
 however feeble or unsuccessful, to stem the flood
 and denounce the growth of opium before two-
 thirds of the whole soil is taken up in the pro-
 duction of what mankind in general consider
 (Messrs. *Jardine and Matheson's* opinion to the
 contrary notwithstanding) a noxious and demo-
 ralising drug, instead of healthy food for the
 millions who till the ground, and by industry
 render China rich in a great variety of alimentary
 products

products fit for the sustenance of man. The censor may well consider 'the cultivation of this plant is attended with grave prejudice to the people's means of subsistence.' If they could even believe with Messrs. Jardine that the opium pipe is 'productive of healthful sustentation and enjoyment to many scores of thousands,' there will still be a very excusable prejudice in favour of rice, corn, and sugar among the million. "Such products will still be held by the vast majority of mankind to offer a better and more healthy sustenance for the human frame, and to be more essential to national vigour and growth than all narcotics and stimulants the earth can supply. According to the memorial of the censor to which this imperial decree is due, the cultivation of opium beginning in Kansu has spread to Shensi and Shansi, and has now gradually extended to Kiangsu, Honan, Shantung, and other provinces, in a word, all over China." Then I say, "I do not anticipate the decree will be much more effective than imperial decrees are in general." "To return, however, to the opium question, and its influence on commercial prospects, there is no doubt that the tendency of this wide-spread cultivation of opium on the soil of China is to diminish the demand for the Indian drug." I draw attention to this assertion of mine because I know it is contested in various quarters. "And although Mr. Cooper's return" (this is not the Mr. Cooper whose evidence you have had to-day, but an acting consul in China), "forwarded by Mr. Lay, would seem to show no material reduction in the demand, and the imports to meet it at Kiukiang and Hankow, it cannot be doubted that such a result must follow." Mr. Cooper merely spoke, of course, of the immediate area of observation where he was posted. There is a report from Mr. Macpherson, the Commissioner of Customs at Newchang, the most northern of our ports, which shows that even there it had spread in a province where one would have fancied that opium could not well be grown. We learn from it that the culture of the poppy had been introduced in a still more unexpected quarter. In his valuable report on the trade of Newchang in the year 1867, Mr. Macpherson informs us, "Careful and well-distributed inquiries tend to show that since the opening of Ying-tzu to foreign trade" (that is the official name of the port of Newchang) "this commodity has become in the interior cheaper by one-half, whilst the number of smokers has been trebled. In a little village among the highlands that form the northern border of the Yéng-t'ien hill district, I lit upon four or five acres given up to the cultivation of the poppy; an acre there yields 200 taels weight of the drug. It was spoken of as being well-flavoured, but deficient in strength, and was 20 per cent. cheaper than foreign opium. Further north, near the Mongolian town of Politan, it is sown on a larger scale, but with smaller results, an acre only yielding 100 taels weight." A tael is an ounce and a third; and as the value of foreign opium is nearly weight for weight of silver, that may give some idea of the value of the crop. "In Kirin the production is carried to a much vaster extent; at least 300 peculs are yearly brought to the market, and the drug is even offered for sale in the shops of Ying-tzu. In the neighbourhood of the producing districts, the presence of the native article must be prejudicial to its foreign rival. At Kirin I found the price of opium considerably lower than at Ying-

tzu when I left; the cultivation of the poppy was only commenced in this portion of the empire three years ago."

5694. You say that the foreign opium is worth nearly weight for weight with silver; is that so? — When it is boiled and made ready for smoking, it does approach to that; the price of opium now is about 600 taels the pecul, which is 133 lbs. I have omitted reading from this despatch what did not seem essential; but that which has been given tends to show, that there is a very large and extensive cultivation of the poppy scattered over all the provinces of China, even up to the north, on the Mongolian frontier, where one did not expect to find it. On May the 19th, I had an interview with Wen-seang, who is one of the leading members of the Foreign Office of Peking, and other ministers, his colleagues. There were no subordinates allowed to be present, and therefore it was strictly a confidential one, and that led them to speak out much more freely on the subjects uppermost in their minds, the missionary question, and the opium in reference to a revision of the treaty; than they would otherwise have done. I should be very glad if you would allow me to read some passages from my despatch on that subject, because it states in the shortest possible way with what view the Chinese Government were then pressing, in fact, for the total prohibition of the opium, as being too injurious to them to be tolerated, or endured. This is a despatch marked "separate and confidential" to Lord Clarendon, dated the 20th of May, but I have permission to read any parts which may seem interesting to the Committee. In that despatch, I said, "His Excellency Wen-seang and two other ministers of the Foreign Board, Tan and Pao, paid me a visit yesterday, during which we had a long conversation on various subjects connected with the revision of treaties, the present state of affairs, and the existing relations between China and foreign states. As none of their attendants are admitted on these occasions, nor any Chinese of my own establishment remain in the room after serving the refreshments; the conversation which takes place is often of a less reserved and more confidential character than when an interview is arranged at the Tsung-li-Yamen" (the Foreign Board). "With no one present but myself, the Chinese secretary acting as interpreter, and the Chinese ministers themselves, both feel at liberty to speak more freely than if the room were filled with servants or persons outside the circle. Neither Wen-seang nor his colleagues are ever likely to speak wholly without reserve; nor can it be expected that they will expose their inmost thoughts on grave matters of state to a foreign minister, towards whom they must always stand in a more or less antagonistic position. Nevertheless, while discussing during two or three hours all those larger questions of policy which directly affect the interests of the two nations, and in no small degree those of all other Western States in treaty with China, the true opinion and sentiments of the speakers must often appear;—all the more certainly where there is no fixed order of proceeding or very definite object in view, beyond the interchange of opinions on subjects of grave import to all engaged, and the mutual desire to arrive at some common understanding as a guide to future action." I merely mentioned that as a preamble to show that I had every opportunity of arriving at what

23 May
1871.

what was their real feeling in the matter. The first part of the interview was occupied with that which very much absorbed them, then as now, the missionary question. "From missionary troubles and dangers the conversation diverged to the hostile animus which was so constantly manifested by the literati and all the official class against foreigners generally, irrespective of religious questions." (There was some little discussion which went on then, in which the minister first denied and then rather defended it.) "In the end, Wen-seang shifted his ground, and after first maintaining the innocence of the party accused, he admitted that there might be some of the literati who were imbued with a hostile feeling; 'But,' he asked, 'how could it be otherwise?' and proceeded to put in a plea of justification, saying; 'they had often seen foreigners making war on the country; and then, again, how irreparable and continuous was the injury which they inflicted upon the whole empire by the foreign importation of opium.' (It came on in that manner; he put it in as a reason why there should be a good deal of hostility). He then added 'If England would consent to interdict this; cease either to grow it in India, or to allow their ships to bring it to China, there might be some hope of more friendly feelings. No doubt there was a very strong feeling entertained by all the literati and gentry as to the frightful evils attending the smoking of opium, its thoroughly demoralising effects, and the utter ruin brought upon all who once gave way to the vice. He believed the extension of this pernicious habit was mainly due to the avarice with which foreigners supplied the poison for their own profit; perfectly regardless of the irreparable injury inflicted; and naturally they felt hostile to all concerned in such a traffic. I only observed in reply to the general tenor of these remarks, that it was quite possible opium smokers might deserve all the evil things said of them, and that the drug was a narcotic, demoralising all who were addicted to its use; although I had received a memorial from Messrs. Jardine & Matheson, loudly proclaiming its innocuousness, and ranking it with wine and other wholesome stimulants and restoratives. But, as regarded the remedy proposed, I could not see of what avail it would be. If Great Britain were at once to allow it to be treated as contraband, and its importation prohibited, China was in no position to prevent its being smuggled in any quantity, even by her own subjects, much less by foreigners; and if even India ceased to grow it, there were many other tropical countries which could and would produce it without limit, while ships under other flags would never be wanting to bring it to the Chinese coast. So long as a demand existed, there would be a supply to meet it. The only result of introducing such a clause into the revised treaty would be to transfer a large and lucrative trade to other lands. Great Britain might lose a large revenue, and her subjects an important trade, but China would be just where she was. A great sacrifice would be imposed on the one country, without the slightest benefit to the other. China herself would probably suffer from a larger quantity of the poppy being cultivated in place of rice and other staples of food within her own limits. The only effective remedy lay with the Chinese people. Let them cease to crave for it or consume it, and the drug would very soon disappear from the market. The remedy did not lie with any foreign power; and

I doubted how far it was possible, in any country, to make people virtuous by legal enactments or prohibitory laws. Wen-seang replied, that if England ceased to protect the trade, it could then be effectually prohibited by the Emperor" (meaning the cultivation in China), "and it would eventually cease to trouble them; while a great cause of hostility and distrust in the minds of the people would be removed, and thus compensation might be found to Great Britain for a temporary loss; temporary only, since the same fields now devoted to the cultivation of the poppy could be made to grow rice, or cotton, or other profitable products. With this irreconcilable difference of opinion as to the efficacy of the remedial measures, there was little to be gained by continuing the discussion, and we passed on to other subjects. This is the first time any serious proposition has been made to reconsider the step taken in the Treaty of Tien-tsin, removing opium from the list of prohibited articles." This was the state of affairs in May, while the negotiations were going on for the revision of the Treaty, from which the Committee will see that the Chinese government were determined to make an earnest effort to induce the British Government to prohibit it altogether, and to take it out, in fact, of the list of goods in which trade was permitted. In a Despatch to Lord Clarendon of June the 29th I transmitted a further communication on the growth of the poppy in China, received from Mr. Caine, our consul at Hankow, and this was also forwarded to the Secretary of the Government of India on the same day; and further reports also from Canton, Newchwang and Tien-tsin were sent under cover to Mr. Chapman at the same time. The general result was to confirm all that had reached me as to the large and increasing consumption of opium all over China, and its production at a price varying from 40 to 50 per cent. less than the price at which Indian opium could be put in the market in China. Subsequent to this conference, I received in the month of June, from the Foreign Board of Peking an official note urging upon Her Majesty's Government the policy of prohibiting the importation of foreign opium as being prejudicial to the general interests of commerce. As the memorial is but a short one, I think it would be satisfactory to the Committee if I read it, instead of giving a mere abstract. "From Tsungli Yamen to Sir R. Alcock, July 1869. The writers have on several occasions, when conversing with his Excellency the British Minister, referred to the opium trade as being prejudicial to the general interests of commerce. The object of the treaties between our respective countries was to secure perpetual peace, but, if effective steps cannot be taken to remove an accumulating sense of injury from the minds of men, it is to be feared that no policy can obviate sources of future trouble. Day and night the writers are considering the question, with a view to its solution, and the more they reflect upon it the greater does their anxiety become, and hereon they cannot avoid addressing his Excellency very earnestly on the subject. That opium is like a deadly poison, that it is most injurious to mankind, and a most serious provocative of ill-feeling is, the writers think, perfectly well-known to his Excellency, and it is therefore needless for them to enlarge further on those points. The Prince" (the Prince of Kung is the president of the Board) "and his colleagues are quite aware that

that the opium trade has long been condemned by England as a nation. And that the right-minded merchant scorns to have to do with it. But the officials and people of this empire, who cannot be so completely informed on the subject, all say that England trades in opium because she desires to work China's ruin; for (say they) if the friendly feelings of England are genuine, since it is open to her to produce and trade in everything else, would she still insist on spreading the poison of this hurtful thing through the empire? There are those who say stop the trade by enforcing a vigorous prohibition against the use of the drug. China has the right to do so doubtless and might be able to effect it; but a strict enforcement of the prohibition would necessitate the taking of many lives. Now, although the criminals' punishment would be of their own seeking, bystanders would not fail to say that it was the foreign merchant seduced them to their ruin by bringing the drug, and it would be hard to prevent general and deep-seated indignation; such a course indeed would tend to arouse popular anger against the foreigner. There are others again who suggest the removal of the prohibitions against the growth of the poppy. They argue that as there is no means of stopping the foreign (opium) trade, there can be no harm, as a temporary measure, in withdrawing the prohibition on its growth. We should thus not only deprive the foreign merchant of a main source of his profits, but should increase our revenue to boot. The sovereign rights of China are indeed competent to this; such a course would be practicable, and indeed the writers cannot say that, as a last resource, it will not come to this; but they are most unwilling that such prohibition should be removed, holding, as they do, that a right system of government should appreciate the beneficence of Heaven and (seek to) remove any grievance which afflicts its people, while to allow them to go on to destruction, although an increase of revenue may result, will provoke the judgment of Heaven and the condemnation of men. Neither of the above plans indeed are satisfactory. If it be desired to remove the very root and to stop the evil at its source, nothing will be effective but a prohibition to be enforced alike by both parties. Again the Chinese merchant supplies your country with his goodly tea and silk, conferring thereby a benefit upon her; but the English merchant empisons China with pestilent opium. Such conduct is uprighteous. Who can justify it? What wonder if officials and people say that England is wilfully working out China's ruin, and has no real friendly feeling for her. The wealth and generosity of England are spoken of by all; she is anxious to prevent and anticipate all injury to her commercial interest; how is it, then, she can hesitate to remove an acknowledged evil? Indeed it cannot be that England still holds to this evil business, earning the hatred of the officials and people of China; and making herself a reproach among the nations because she would lose a little revenue, were she to forfeit the cultivation of the poppy! The writers hope that H. E. will memorialise his Government to give orders in India and elsewhere to substitute the cultivation of cereals or cotton. Were both nations to rigorously prohibit the growth of the poppy, both the traffic in and the consumption of opium might alike be put an end to. To do away with so great an evil would be a great virtue on England's part; she would strengthen friendly

relations and make herself illustrious. How delightful to have so great an act transmitted to after ages! This matter is injurious to commercial interests in no ordinary degree. If H. E., the British Minister, cannot, before it is too late, arrange a plan for a joint prohibition (of the traffic), then, no matter with what devotedness the writers may plead, they may be unable to cause the people to put aside ill-feeling, and so strengthen friendly relations as to place them for ever beyond fear of disturbance. Day and night, therefore, the writers give to this matter most earnest thought, and overpowering is the distress and anxiety it occasions them. Having thus prestimed to unbosom themselves, they would be honoured by his Excellency's reply." I think that the Committee will see that this is a very significant document.

5695: Mr. J. B. Smith.] That was in 1869? —In 1869, while the revision of the treaty was going on.

5696: [Chairman.] What took place after that? —I found, in consequence of the investigations I had set on foot all through China that Li-hung-chang, who was one of the most distinguished of the Viceroy or Governor Generals of provinces (then the Governor General of the Hukwang province), had actively employed himself, both in Honan which he also governed provisionally, and in the adjoining province, under his brother, in promoting the cultivation of the poppy. I received reports that nearly the whole of Szechuen was given up to the production of opium, and that on the appearance of the edict enforcing the prohibition, he had memorialised the throne for leave to issue licenses as a productive source of revenue, and a means further tending to exclude the consumption of foreign opium (a much more pernicious drug he alleged, and the importation of which impoverished the nation). It thus appeared that the policy only shadowed out as a possible contingency or necessity in the official note of the Yamen of ruining the trade in Indian opium, by encouraging the native growth, was the course which had been suggested by Li, and by him and his brother practically carried out already on a large scale. His high official position and political influence both combined to make his individual action in this matter very significant in connection with the covert menace conveyed in the official note. So important did the state of the opium question appear to me at this time, that in my despatch to the Foreign Office communicating the information, I intimated my intention of proceeding to Calcutta on my return home, in order that I might confer with the Governor General, and put him and his Council in possession of the facts, and show the whole bearing of them, so as to make sure that they were in full possession of all the information necessary to enable them to arrive at a right judgment on so important a matter. I proceeded to Calcutta in January of the following year, and placed the information which I am now giving the Committee before the Council at Lord Mayo's request. Having now given the outline of the case, I shall be prepared, either now or later, to furnish the Committee with any details they may desire. I think it will be seen the substance of the whole is this: that there is a very large and increasing cultivation of the poppy in China, that the Chinese Government are seriously contemplating, if they cannot come to any terms or arrangement with the British Government

Government for restricting the area of growth in India, and either gradually, or suddenly, putting an end to its importation, as they think they have the power to do, the cultivation without stint in China, and producing opium at a much cheaper rate. Having done that they think they will afterwards be able to stamp out the opium produce among themselves. I doubt their power to do so, but that is their theory.

5697. Did you endeavour also to ascertain how much a pound of opium could be produced for in any given district in China?—There is a Report of the Delegates of the Shanghai Chamber of Commerce, who went with an expedition that I sent up the Yangtze. You have there some detailed information. I have a great deal of the same kind, but it is all corroborative of what is given there.

5698. Will you call attention to the passages in that report on which you rely?—At page 21 it goes very thoroughly into those matters of detail, from the information they got on the spot. They say: "The price of the Szechuen opium varies according to the season; when the new crop is first gathered it is cheap, say, about 11 taels per 100 taels weight, but becomes dearer towards the end of the season, say, 13 taels per 100 taels weight, which is natural considering how much it must lose in weight by keeping. The price usually quoted to us by the cultivators was 200 cash per tael, which corresponds tolerably well with the above quotations of 11 to 13 taels per 100 taels weight, given as the country-price by merchants in the cities; we may conveniently reckon the price, at 200 taels per pecul in the country, though it probably averages about 10 taels under that figure." The Indian opium sold there varying from 450 to 600 taels the chest, you get an estimate there of the great difference; then from 100 to 150 taels is added by way of taxation charges of all kinds before it reaches Shanghai; so that the difference ranges from 350 taels in the case of the native opium to from 450 to 600 in the case of the Indian in the Shanghai market.

5699. Did you make any inquiry as to the rate per tael or per 100 taels of the different impositions that were made upon people in growing opium by the authorities?—Yes; that is also given, I believe, very accurately in the report. I have got some other information but it is much to the same purpose. It says here, "The growers pay in some places 5 cash per tael lekin, equal to 3 mace per 100 taels weight; in other places they pay 7 mace per 100 taels; they also pay a tax or squeeze to the hong of the district which are licensed to deal in opium; this tax is put down at 2 cash per tael weight in some places," and so they go on till the whole thing amounts to 7 taels or 7 taels 3 mace per pecul charges; what the hong make out of it in the shape of commission on sale they could not ascertain; the duties payable at the barrier at Kihwei are, Lekin of 600 cash per 100 taels or 9,600 cash per pecul; "At Ichang a transit duty of 39 taels per 100 catties is nominally charged; but 100 catties of actual weight are reckoned as 40, which reduces the tax to 15 taels 6 mace per 100 catties."

5700. Do you suppose that that includes all the presents made to the authorities for conniving at the growth of it?—They do not connive at it; because, according to Lihung Chang's plan, they give licenses, and the license is the first charge that they pay. The Committee will see, on going further in that report, that the delegates

make out 70 taels, as added to the first cost (there are different charges) at Hankow, and about from 30 to 70 additional before it gets to Shanghai, making at the outside 150 taels. So that the Chinese have not hitherto carried out that other part of their threat, which is quite within their power, of not taxing their own opium at all, and surcharging ours with any amount of tax they like. There is another estimate of the taxes paid, a "grower's tax," about Hankow taels 9; Ichang, or Sha, the barrier duty, 30 taels; meltage fees, 4 taels 7 mace; Hankow Lekin, 9 taels 5 mace; making in all 53 taels 2 mace; that is up to Hankow.

5701. Did you find out at all the relative strength of the Chinese opium, as compared with the Indian opium?—Yes; I have various reports on that subject. There is one of Mr. Jamieson, who was a medical officer attached to the customs.

5702. I was anxious to ascertain how much of opium for smoking is produced from a given weight of the native opium, as compared with the quantity produced from Indian opium?—By Mr. Jamieson's analysis, in 100 grains of the drug, there were found 5.90 grains of morphia, and 7.53 of narcotine, but the sample was adulterated: and free from this, Dr. Jamieson concludes the per centage of Morphia would rise to 6.94, and that of Narcotine to 8.86. The standard average of Morphia in Turkey drug is 10.50 per cent., and of Narcotine 7 per cent., sometimes sinking to 6 per cent. It will thus appear that in medicinal value, Chinese opium can take a good position even when compared with Turkey. We are told that the value of opium for medicinal purposes, and for the effects which commend it to the opium eater, depends mainly on the per centage of morphia. But morphia which is solely narcotic is accompanied by a principle which seems to be unfortunately named—narcotine. This ingredient, without possessing any narcotic property, is a bitter resembling quinine, and like quinine has been used with success in diseases and fevers of a periodic or intermittent type. This opens a new view as to the possible prophylactic effects of opium in marshy and malarious districts.

5703. You spoke of the Turkey opium; what is the standard of Turkey opium as compared with Malwa opium?—The Turkey is a very powerful opium. As I have said, the standard average of morphia in Turkey drug is 10.50 per cent., and of narcotine 7 per cent., sometimes sinking to 6 per cent.

5704. As compared with Malwa opium, what is the standard?—I do not know that I can put my hand upon further data immediately. As regards Malwa, there is a considerable abatement from the power and strength of the Indian opium. The Chinese is much weaker.

5705. But we want to form some estimate of the relative value of the two for commercial purposes. For that purpose it would be necessary to know what is the relative production of morphia and narcotine, those being the only elements, I believe, of actual intoxication?—Those, and thebain, which is said to have the erotic quality, and which exists in the Turkey, and does not exist, apparently, in the Chinese. If that be so, it may be one reason why they prefer the latter, assuming they do prefer it, as being less stimulating and therefore less enervating in the end.

5706. Can you find an analysis of Malwa or Patna

Patna opium?—At page 22 of the Report of the Delegates, you find this, “The quality and strength of the Szechuen opium varies according to the district. Fungtoo opium is said to yield 75 per cent. of extract; Foo, 70 per cent.; Kai, 80 per cent., and so forth. These are vague native estimates, but more exact information on the subjects will be found in Appendix H;” that is at page 60, “On boiling two taels weight of Patna opium down, to draw a comparison with it and the Yunnan opium, I find that so far as the touch is concerned, the latter compares very favourably. The Chinamen, however, prefer Patna opium for smoking. They state, that the Yunnan drug has no taste in smoking, like that of Patna. I presume they mean it is not so palatable.” “The ‘touch’ of Patna and Yunnan opium is similar, and 48 taels of each will produce about 26 taels of pure opium.”

5707. That would make the Bengal equal in value, according to that statement?—Yes, it would, according to that, but there is a difference in the morphine and in the existence of the thebain.

5708. The comparison of price, therefore, does not afford a solution of the question unless we have a comparison of the quality of the two drugs?—The two have to be taken together.

5709. I was anxious to finish your comparison, by finding out if we could, with some precision, the relative values, or what would be more to the point to find out commercially how much a man has to buy of one, compared with what he has to buy of the other; that is the practical solution, is it not?—That practical solution I am afraid I

cannot supply; but I have among my papers an analysis of the various descriptions, and the general result of it is, that the Indian opium is undoubtedly superior in the essential qualities of narcotine, morphine and thebain. The degree of superiority will hardly determine the commercial value. The practical test would be, how much a man would have to put in his pipe of each to produce the same effect, and then the difference of price would give as the practical result the relative commercial value, apart, that is, from any question of taste or fashion.

5710. I was wanting to ascertain whether there was any economy in the consumption of one as compared with the consumption of the other, whether a regular opium smoker would buy an ounce of the one, and an ounce and a half of the other, for instance, to be satisfied?—The reports tell us that practically the Indian opium does go further, because it will permit of smoking a second time, and some of the lower smoking shops consume it chiefly after it has been prepared a second time.

5711. If you had the greater advantages that you derive from using the Indian opium, as compared with the native, we may take it that they are at present of equal commercial value?—That would tend to equalise what is otherwise a striking difference in price. I have not worked it out in precise terms, but I think that I have data by means of which the relative value or strength could be more accurately ascertained.

5712. The practical question is whether a man has to buy less of the one opium than he buys of the other?—Yes.

Sir
R. Alcock,

THE RIGHT HONOURABLE ACTON SMEE AYRTON, IN THE CHAIR.

Sir RUTHERFORD ALCOCK, K.C.B., re-called; and further Examined.

Sir
R. Alcock,
K.C.B.
6 June 1871.

5713. *Chairman.*] I THINK you stated in the last day's evidence that you could give, in more precise terms, the difference in the value of the opium of the different qualities; have you been able to get any precise information on that point? —I have been looking through various papers that contain analyses of different kinds of opium, Indian, Persian, Turkish, and Chinese. The general result is stated in various places to be (and I think you will find that any investigation you may make will come to the same), that upon the whole the proportion of morphia varies but little; that it is a little in favour of the Indian, but not very considerably, and that there is not any very essential difference in the quality or in the power of the intoxicating ingredient, if we except Turkish, where the morphia is nearly eight per cent. instead of three or four. But I wish to observe that I think the question of the value to the smoker, which is what you wanted to get at, of the different kinds of drug is not altogether to be determined by the same sort of considerations as determine price in other articles. I think that I can illustrate this to the satisfaction of the Committee by a reference to tobacco. For instance, it is very well known to all those who are in the habit of smoking either Havannah or Manilla cigars, that those who smoke the Manilla habitually, not only cannot smoke the Havannah with pleasure, but cannot smoke it at all, or without prejudice, from the effect that it has upon the nerves; it has a different effect from the Manilla, something analogous to the effect on those who are accustomed to take black tea produced by their taking green. In reference to the Manilla cheroot and the Havannah cigar, there is no doubt that the Havannah to all judges has a finer flavour, is considered superior, and is more fashionable; and yet those who have lived long in the East, and in China especially, almost invariably prefer the Manilla cheroot, which does not cost above half the money, and for the same reason as the Chinese prefer one kind of opium to another, namely, that it does not affect their nervous system so much.

5714. I do not wish to destroy the value of your illustration, but is there any foundation for

the impression that the Manilla cheroots are dressed with opium?—None whatever, I believe; I have made some inquiry about that, and I am satisfied it has no foundation, and for this simple reason, that opium being infinitely more costly than tobacco, it would not pay. That was the answer I got from all those merchants and others who were familiar with the manufacture. Then I was going to say, that it is evident the prevalence of a fashion or taste for any particular article containing more or less of narcotic and intoxicating power, does not altogether depend upon the absolute strength of the intoxicating quality. I think the illustration, both as regards the black tea and tobacco is perfectly applicable; therefore, when we get at the result, which you will find through a great variety of analyses, it would come to this, that there is no very essential difference. They have very much improved the quality of the Chinese opium of late years, and have got rid of what the consumers complained of as a grassy taste. It is now largely consumed, and if the Committee desire it, I will go into this question of consumption, as I find that the fact is contested. There was a letter the other day in the "China Telegraph" which scoffed at the idea that there was or could be any competition, and I found the same idea prevailing amongst some of the officials in India.

5715. It comes back to the illustration of wine, that you cannot measure the value of wine by the alcohol in it, and, in the same way, you cannot measure the value of opium by the morphia in it?—Precisely. Then, in reference to the value of opium, in answer to some question in relation to the profit of cultivating the land, I said that its value was weight for weight with silver, and that seemed to create some surprise. On referring, I find that in the Delegates' Report the same thing is stated, the value of opium is there described as being nearly weight for weight with silver; that, of course, I meant to apply to the extract when it was fined down.

5716. Four ounces of silver is the price of a pound weight of solid opium; a pound sterling is equivalent to a pound weight of opium?—You will find that it goes beyond that; but in refer-

ence to my impression that it was sometimes worth weight for weight of silver, it has been more than that at one time. You will see the Delegates Report this: "When Patna opium had been introduced from Canton, and had made some way in Szechuen and the neighbouring provinces, it was worth, in the early years of the reign of Toukwang" (that is 1821) "double its weight in silver." At page 22 they say, "Foreign opium is also brought to Chungking by Canton men, in tins, prepared, estimated value 70,000 or 80,000 taels annually, all smuggled. It is used as a luxury, and is worth 9 taels per 10 taels weight, sometimes being as cheap as 8 taels."

5717. Then it is explained, perhaps, by the enormous enhancement of price in the interior of China from the difficulties connected with importing it and carrying it inland against all sorts of prohibitions, till at last it gets enhanced from its price in India, which is about four ounces of silver to a pound weight of opium up to 16 ounces of silver in the interior of China?—Undoubtedly; and what I meant to convey was, that it was a crop which yielded such very considerable profit that when it had to go any distance it was really something approaching weight for weight with silver in its value.

5718. Have you anything which you wish to add on that subject?—No.

5719. Mr. Birley.] Do I rightly understand you to say that the value of the opium might advance as much as from four taels in proportion to 16 taels in the interior?—With regard to the selling price for the prepared opium, the extract, when all insoluble matter is got rid of, the delegates, who themselves were mercantile men of great powers of observation and accuracy, ascertained that in Szechuen, when it was brought from Canton, which of course was a very round-about way (I presume they might get it cheaper from Hankow), it was about nine taels for 10 taels weight. You may take it at that if it has to traverse two or three provinces.

5720. What would be the price in Canton for 10 taels weight?—Nearly all the opium that gets to Canton is smuggled from Hong Kong, and I presume that it would be very much cheaper. I think that you may take the prices at Canton (any newspaper will give the ruling rates) to be pretty nearly the same, or very little more than the price at Hong Kong, plus a certain smuggling fee which would no doubt be paid because there is no expensive transport.

5721. Chairman.] Have you got the Hong Kong price with you by any chance, so as to show what the enhancement is?—In any of the price lists the difference between Shanghai and Hong Kong is never very much; it rules pretty much the same at all the ports, with certain variations from time to time. I have no price currents here. I have some notes of prices in 1868. The selling price of Malwa was then 500 taels, and Patna 430; but they vary, as you are aware, from month to month and year to year. There is generally a distinction in favour of Malwa to a considerable amount.

5722. Mr. Birley.] That is the relative value, I suppose, at the same date?—Yes.

5723. Mr. Beach.] I think we are to understand that you consider that the consumption of Indian opium in China is likely to fall off?—Yes, but that is a contested point. My own opinion is based upon the reports of the merchants generally in China,—the delegates of the

chambers of commerce,—and those merchants, such as Sassoon and Company, who are more especially interested in the Indian opium, the consuls' reports, and those of the Commissioners of Maritime Customs, the two last being perfectly disinterested. There is a perfect accord amongst them; and I can read here, if the Committee desire it, some extracts which would show, by cumulative and concurrent evidence, that there can be no doubt the cultivation and consumption of the Chinese opium are both very largely increasing, and that they do affect, injuriously in our conception, the consumption of Indian opium, and the price.

5724. It is only the edict which prohibits the cultivation of opium in China, which checks it being cultivated to a much greater extent?—As I have stated before, all these edicts are more or less inoperative, and are very badly executed. In the present instance, some of the higher officials even memorialised the throne, and give licenses for the cultivation. But, independently of that, the chief influence of an existing edict of the Emperor against the growth of opium, backed by the general sympathy, and popular feeling in favour of such an edict, is this, that no man can grow his opium without knowing that he is exposed to all kinds of sacrifices. A man comes to him from the magistrate of his district, perhaps, and says, "You are cultivating so many fields of opium; I know what you are about, you had better make it all straight." Of course if he is liable to be seized, and to have his crop torn up, (and there have been instances where the population have banded together for that purpose), the effect is both to increase the price of the Chinese opium by adding to the risks, and to deter a great many of the more timid from cultivating it at all.

5725. The Government make a profit from the Indian opium which leads them rather to encourage the importation of it, I presume?—Yes; the revenue which they derive from the maritime customs is something like half a million sterling in round numbers, from that to 700,000*l.* at the outside, and I presume that they double this by their inland taxation. Therefore, I have estimated the absolute interest of the Chinese Government in the Indian trade at about a million and a half sterling; and in reference to this I may mention that not only in the conference that took place with the ministers of the Tsung-li-Yamen, a minute of which I read at the last meeting of the Committee, but also at different times, officially or privately, they have shown the greatest readiness to give up the whole revenue if they could only induce the British Government to co-operate with them in any way to put it down. My own conviction is firm that whatever degree of honesty may be attributed to the officials and to the central Government, there is that at work in their minds that they would not hesitate one moment tomorrow, if they could, to enter into any arrangement with the British Government, and say, "Let our revenue go; we care nothing about it. What we want is to stop the consumption of opium, which we conceive is impoverishing the country, and demoralising and brutalising our people."

5726. Mr. Fowler.] Is it true that the value of the opium imported into China from India is nearly equal to the whole value of the exports of silk and tea from China to the various countries of the world?—I think that estimate has been formed in reference to their exports of tea

Sir
R. Alcock,
K.C.B.
6 June 1871.

Sir
R. Alcock,
K.C.B.
6 June 1871.

and silk to us, not to the whole world. There is a statement in the Delegate's Report which will give it to you. It is from 76,000 to 80,000 chests, which at 500 taels a chest, is about 11 millions sterling.

5727. If the opium trade were abolished, would not a large proportion of the money now expended on that drug find its way into the pockets of the British people in return for manufactured goods?—It has been urged by some of the merchants and in the local press that the effect would be to raise the exchange, which has been very much depressed of late years, and to improve the demand for foreign manufactures.

5728. Have you any means of judging to what extent the legitimate commerce between this country and China has been injuriously affected by the opium trade?—Except in its general bearing upon the policy of the Chinese Government, I can give you no precise data other than such as the general returns afford. As regards the bearing upon the government of China, if I had been enabled during the recent revision of the treaty to hold out any distinct promise or assurance to them that, both as regarded missionaries and opium, which are their two great grievances, something should be done more or less restrictive that would meet their wishes,—I believe that I might have got any facilities for our trade that I had chosen to demand. My great difficulty was that I could offer them nothing in either direction.

5729. Have you ever known of cases in which silk or other Chinese commodities have been bartered for opium?—I think so; I think that it is common, or has been common in the trade, to make a barter of the two, merely paying the difference of amount. I think it was a very usual course.

5730. Does it accord with your own observation that the use of opium at last becomes necessary to the smoker as a means of sustaining life?—That is a very difficult question to answer, for this reason, that I do not believe that we have any statistics or sanitary records extending over a sufficiently large field, or sufficiently to be trusted for anybody to dogmatise on the subject, or to give a very decided opinion. If we judge from what we see of the abuse of it, the miserable decrepit objects who are confirmed opium smokers, no doubt we should come to the conclusion that when a man had once taken to it it was inevitable that he should go on to his destruction. But I think that the same inference might with equal logic be drawn with regard to a confirmed drunkard: a time comes when he goes into fits of delirium tremens if he cannot indulge his habit. Whether there is anything in the opium so insidious or affecting the whole nervous system so peculiarly that a man who has begun to take it must go on increasing the dose to his perdition, I cannot say; but that is precisely what a great many people assert, and what all the missionaries believe, who have a great deal to do with the people and see a great deal of the abuse. And with regard to the Chinese themselves generally, that is certainly their impression, as I know from my intercourse with the officials, and one sees a great deal to confirm it; but still I do not think that we have any data that would justify our drawing a decided conclusion on the point.

5731. Are you acquainted with the hospital established by the London Missionary Society at Peking?—Yes, certainly.

5732. Has not that hospital been the means of curing many patients who have gone there for the purpose of getting rid of the craving for opium?—I know that they have had applicants for such relief, and have made the attempt. I confess, however, that the impression on my mind, from all that I have heard from different medical officers, not only there but at Shanghai and elsewhere, has been rather discouraging; I do not think that they often succeed, partly because they cannot get the people to put up with the strain that deprivation brings on their system.

5733. Then your experience would be that the craving for opium could not be cured?—Just so, after it has arrived at a certain pitch. I do not suppose that people ever come to them for a remedy till they feel that they are going down a rapid descent, and then it does not appear to me that they have had any results that are very encouraging or satisfactory. I may mention one instance, which does not enable me to decide your question, but has a bearing upon it, showing that a stage comes when nothing but a continued use of the opium will save a man from falling altogether into a state of imbecility. A consul mentioned to me on one occasion, that a Chinese prisoner had been temporarily put in a lock-up attached to one of the ports, he being a confirmed opium smoker. He had seen him at the time when he had been consigned to imprisonment pending some inquiry with the Chinese authorities, and he was there only for 24 hours, or from that to 30 hours, and he said that when he saw him come out he never was so much struck or shocked in his life with the change in a man. In 24 hours he seemed to have fallen into old age; he was haggard; he was unable to collect his faculties; in fact, he had sunk into total decrepitude and old age apparently in 24 hours. It must have been something very striking to have made that impression on the consul.

5734. He did not see him afterwards?—Not that I remember: the man had not had his usual dose of opium, and that case shows the frightful effects of going without it in some instances of inveterate habit.

5735. Have not the missionaries complained to you of the injurious effects of our connection with the opium trade on their efforts to christianise the natives?—Of course, it is their constant complaint.

5736. Is it true, as the missionaries alleged in their letter to you of the 14th of July 1869, that "almost every abusive placard that has been issued against Protestant missionaries, has charged them either with secret designs of conquest, or with being engaged in the coolie or opium trades, and making the teaching of virtue a cloak for these abominations." The "New York Observer" also states, that "Our name is popularly bound up with the opium trade; and whenever missionaries come to a new place any dislike which the literati or officials may feel against them can always be strengthened and excited by bringing up the opium trade and opium smoking." Do you agree with that statement?—The coolie and the opium traffic being the two grave reproaches the Chinese bring against us habitually, no doubt they are always seized upon whenever there is any desire to rouse popular feeling; and I have no doubt that the missionaries are correct enough in saying that in the placards they generally resort to this means

means of stirring up hostility. In reference to the statement from the American paper, that it is always popularly attributed to us, it is very true; but I think it should not be lost sight of, that the Americans themselves contribute their full share in the traffic.

5737. Is it true that the present emperor's mother ordered a eunuch to be beheaded for permitting the young emperor to smoke a few whiffs of an opium pipe?—I do not know the fact. It is reported that the father of the late emperor killed a younger son when he found that he was smoking opium, and I believe that this is tolerably well authenticated.

5738. Can the evils, physical, moral, commercial, and political, as respects individuals, families, and the nation at large, of indulgence in this vice be exaggerated?—I have no doubt that where there is a great amount of evil there is always a certain danger of exaggeration; but looking to the universality of the belief among the Chinese, that whenever a man takes to smoking opium it will probably be the impoverishment and ruin of his family;—a popular feeling which is universal both amongst those who are addicted to it, who always consider themselves as moral criminals, and amongst those who abstain from it, and are merely endeavouring to prevent its consumption,—it is difficult not to conclude, that what we hear of it is essentially true—and that it is a source of impoverishment and ruin to families.

5739. Has it not been one great reason of weakening the government and introducing anarchy into China?—They say so, and I should think that the very fact that they have been compelled by the superior force of foreign governments to admit it against all the moral feeling and judgment of the nation, and against their own, as an article of commerce, and to derive a revenue from it, must very much damage them in the estimation of the people, first as a sign of deplorable weakness, and next as an indication of want of courage to do what was necessary for the welfare of the nation.

5740. I think I understood you, in reply to my honourable friend, to say, that you believed that the Chinese government were perfectly sincere in their desire to put an end to the consumption of opium?—I believe they are.

5741. And they are not deterred from that by the evils which it is alleged would follow from the suppression of a habit that has become confirmed among a larger portion of the people?—Backed as they are, really, by the popular feeling of the nation, and having their sympathies, as they certainly would have, in an effort of that kind,—if they could not be reproached with admitting it and deriving a revenue from it when imported from abroad,—I do not think they would hesitate to make a crusade against it; how far they would succeed or not, is another question.

5742. If it was not imported and not grown, they must succeed?—Exactly, but the question is, first, whether they could prevent its importation;—even supposing that they were to prohibit it, how far could they prevent its being smuggled, either from Turkey or Persia, from India or elsewhere;—and next, how far could they succeed in stamping its growth out in their own country? a thing of which they say they feel quite confident if they could be strengthened by being able to show the people that they will no longer admit it from abroad. They have always put that

059.

forward as being the one impediment to their doing anything effective in their own country. They can scarcely behold people for either growing opium, or consuming it, when the people can turn round upon them and say, "You admit it from abroad that we may consume it, and you derive a revenue from it; how then can you impeach us as guilty of a grave offence if we grow it ourselves, and are willing to pay you duty too?"

5743. Sir *Wilfred Lawson*.] A former witness said that he thought there could not be much greater consumption in China, without causing such a calamity that the Chinese, themselves, would cause a reaction; do you think that they could not increase the consumption very much?—My own opinion is, that we very much exaggerate the area of consumption, because we know very well what is brought to China from abroad; and that it does not exceed 80,000 chests; although we do not know equally certainly what amount is now grown in the provinces. It is roughly estimated that about half that amount is grown. We know also that the ordinary consumption of a Chinese, who can afford it, is from half a mace to a mace a day, and a great many of them smoke more.

5744. Sir *J. Elphinstone*.] That is about 3*d.* a day, is it not?—It varies with the amount of cash in a dollar; it is from about 3*d.* to 6*d.* a day. It is a very easy calculation to make; supposing that you have 120,000 chests of opium, and that every man smokes, say, his mace a day, you will see that you have not got above three or four millions of people who can consume it at all. Three millions or four millions, out of what we are in the habit of assuming (for we have no census of it) to be the population of China, namely, three hundred or four hundred millions, is an exceedingly small proportion of the whole; therefore, I should say that the consumption might be increased almost, *ad infinitum*, threefold, fourfold, fivefold, and still leave the body of the nation unaffected.

5745. Then you do not think that opium smoking has eaten into the heart of the nation, so to speak, but you think that there is a far larger proportion of persons untainted by the practice than of those that are tainted by it?—Yes; upon those data I cannot come to any other conclusion, because it does not appear to me that there is opium enough to do it.

5746. A former witness said that the Chinese themselves all admit that the effects of opium smoking are bad; does your experience bear that out as being their opinion?—I think it is universal; I think that the men who smoke opium look upon themselves as morally criminal.

5747. I think, in answer to the honourable baronet, one witness told us that in China it was considered a necessary of life; is that your experience?—No doubt it is, just as a man who is in the habit of taking his glass of brandy two or three times a day finds it a necessary of life; in no other way.

5748. I think it was put to the witness that the Chinese live on unwholesome and putrid meat, and that opium is a corrective of that, and the witness answered the honourable baronet that it was the case; what is your opinion on that point?—I think it may have certain sanitary influences which we are not very ready to admit. In the first place, narcotine, which exists to the amount of about seven per cent. in opium, is decidedly

Sir
R. Alcock,
K.C.B.
6 June 1871.

Sir
R. Alcock,
K.C.B.
6 June 1871.

decidedly a tonic, and a preservative; it is given in India as a tonic as we give quinine. In a malarious locality, such as the whole of that vast valley of the Yangtze is, and under a tropical sun, and considering that although their food is vegetable food chiefly, what animal food they do consume, and vegetable also, is often eaten in a putrid state, they rather preferring it in that condition. I think it very possible that it may have sanitary influences. I do not think we should lose sight of the possibility of that; I have no doubt that a man may preserve his health under some circumstances, if he could only use it medicinally, better than without it, just as a man in campaigning, or when exposed to great deficiency of food, may be able to go through his work with much less harm to his system with moderate smoking than without tobacco; and so with malt liquor and spirits. I think there is that element in the question of opium as much as in the question of liquor and tobacco.

5749. Then we have had it in evidence that some of these confirmed smokers were able to do an immense deal of work, but the moment the supply was stopped the effects were terrific; does your impression correspond with that?—Yes; I know very well by my own servants, and by coolies, and other workmen, that you would not get the same work out of them if you stopped their opium. In fact, to deprive men of their usual daily dose of opium, would be to incapacitate them for work, and to depress and enervate them, and leave them without their usual vigour.

5750. Do all the persons in that class of life whom you employ smoke opium?—Almost invariably; the truth is, that the spread of the consumption of opium has been chiefly from the coast.

5751. In that case you have not had an opportunity of seeing whether the non-smokers or the smokers are the more efficient in work?—No, I have had no means of comparing the two.

5752. I suppose you agree with a former witness, that the chief evil of this smoking is the great expenditure of the people upon it; it does not so much, I suppose, cause crime, but it is more the poverty which it causes by the great expenditure of the people, that is the evil?—Yes; there is this difference between liquor (wine or spirits) and opium, that the one leads to crimes of violence, and the other never does, except indirectly as a means of getting wherewith to buy the opium. When a man has impoverished himself and impoverished his family, I suppose there is no crime at which he would stop for the sake of supplying himself rather than undergo the torture that it is, to the utter effacement of his existence almost, to be without it; so that he will sell his wife and children and property, and in the end, I suppose, will either rob or murder for the sake of it. In that way it produces crime and great social misery.

5753. As a general rule, the opium smoker deprived of his opium would be willing to resort to those means of getting it, would he?—A confirmed smoker, who could not exist if deprived of it without suffering great bodily torture would; unless he took the other course, which is very common with the Chinese, namely, to hang or poison himself. He would probably sell his wife and children first, and after that do anything else that might be necessary.

5754. Then do you think that as far as you have seen, the using of the opium does not injure

a man very much, but that the harm arises from his being deprived of it; that after he has become accustomed to the opium his constitution suffers very little unless he is deprived of it?—No, I could not say that that is my opinion; I think the question is yet undecided how far it is possible for a man to do with opium as we do with wine; where, as a rule a man takes his pint or half-pint of wine a day, and does so for years, and it may rather improve his health than otherwise; but yet if deprived of it the loss would not much affect his health, probably. I do not think that is the case with opium; at all events, the question is quite undecided whether a man can take opium in moderation for a continuance; and if he can, whether he can leave it off without injury to his health. If he can take it in great moderation, I should think he might leave it off without injury; but I think as I say, that the question is quite undecided whether he can take it in such moderation for any lengthened period.

5755. Then you would not give in your adherence to the opinion of one witness, who said that if the supply of opium were suddenly stopped one-third of the people of China would die?—If that refer to what we should call confirmed drunkards, I believe it would kill them; they would die of dysentery and in frightful suffering, and be utterly disorganised, so to speak; but then I think that this only applies to people who have become confirmed slaves of the habit; and I do not know how far it applies to those, if there be any, who for a series of years take it in moderation. That is a question that I have never been able to decide for myself. I know that any one can take three or four glasses of wine every day for 20 years, and neither desire more nor feel any very cruel deficiency, even if deprived of that; but I have never been able to ascertain whether such is the fact with regard to opium. I know it is asserted by those who favour that view, but it is stoutly contradicted by the missionaries and others, and my own impression is that it is not possible in the case of opium. We know that medicinally no patient can go on taking the same quantity of it, so as to produce the same effect; there is a necessity for increasing the dose, and when increased to a certain extent it gets a hold on the system which is very pernicious. Medical men will tell you that this is their invariable experience.

5756. You say, if I rightly understand you, that you never in China met with a moderate opium smoker; that is to say, one who you think would not have been better without even the amount that he did consume?—As a rule that may be so; but, for instance, all our domestic servants smoke, and they do not smoke in excess, or we should not keep them.

5757. What do you mean by excess?—To such a degree that if deprived of their opium, or delayed, they would collapse like the prisoner whom I mentioned.

5758. But they all go on steadily to that stage, as I gather from you?—That is my impression; I am obliged to speak vaguely however, because we have not the data or statistics on which we could dogmatise at all about it.

5759. I do not know whether you can tell us at all whether the state of the country was better in regard to prosperity and comfort and that sort of thing, before this great consumption of opium?—It is very difficult to entertain any doubt on that point; the Chinese before this century

century were certainly about the most temperate of races; their food was chiefly vegetable food; they had no stimulants except a mild tobacco and tea, and they seem to have been perfectly content with that; and they must have kept their strength and health, for they had always been known as a most industrious race, cultivating their land to the highest degree, and as being hard-working people. They were that before they had this opium; and tea and mild tobacco certainly could not produce the effects that we now see opium produce, and there is nothing in their history to make one think that there was more pestilence or greater mortality, or that they were less capable of performing the work of the nation then; and I must say that my own impression is, that they were infinitely better off without the opium.

5760. Is it true that when you left China, Prince Kung in taking leave of you, said "Good-bye; I hope you will take away your opium and your missionaries"?—Yes; but it did not quite occur in that way. He came with the other ministers to take leave of me as a matter of courtesy, and naturally he referred to all the discussions which we had had in the revision of the treaty; and as we had neither of us obtained exactly what we wished, and the missionaries and the opium had very often been brought forward as the great obstacles to any perfect understanding, I alluded to those conversations and to the signing of the convention, and I said, "After all these discussions, now that we have entered into a convention regulating many points, I hope that, though I am going away, you will find other matters will settle themselves satisfactorily, and that there will be a gradual improvement in our relations and in the progress of our commerce." He shook my hand very cordially, and said, "Yes; we have had a great many discussions, but we know that you have always endeavoured to do justice, and if you could only relieve us of missionaries and opium there need be no more trouble in China."

5761. Mr. Grant Duff.] May I ask which does the Chinese Government hate most, missionaries or opium?—It would be very difficult to say, for the missionaries are a perpetual thorn in their side. The Roman Catholics especially penetrate into the interior, and are doing what I may be permitted to say churches have done in all ages; they aggregate property, they get land, and houses, and pagodas, and they are now some of the largest landed proprietors in the different localities; and by the French Treaty they had a right to reclaim whatever land or houses had belonged to Christian communities when the persecution took place, and they were all expelled, in the 17th century. And I think that the Committee will very easily understand what is the feeling of the Chinese Government and of the people about these matters, if they will conceive that, after some frightful defeat sustained by us, either French or Prussians, or any other nation, came to us and said, "Well, you are Protestants now, but you were once Roman Catholics, or had something of Roman Catholicism about you, and one of the conditions of peace is that you shall restore to that communion whatever land was confiscated under Henry the Eighth." You may conceive with a French government, for instance, to back that forcibly, what would be the sort of feeling that would be created throughout this country in all those who

0.59.

possessed those lands, and in the government that had to carry out the necessary measures.

5762. (Chairman.) But the ratio of the influence of restoring Roman Catholic lands in China would not be quite so great, would it?—We are a very small country; but if you will take this country, multiplied by 18, you may say that in China you have the same evil in 18 provinces.

5763. Not the same extent of property; it is very infinitesimal in China, is it not?—But it is quite large enough to create an intense feeling of irritation and hostility throughout; and as it is done under the direct influence and protectorate of France, which is a foreign power, it is in kind, if not in degree, what you may conceive would take place under the circumstances that I have supposed.

5764. Sir W. Lawson.] I perceive that in the interesting conversation which you have related in your former day's evidence as having had with one of the Chinese officials, you told him that you thought the drug was a narcotic, demoralising all who were addicted to its use?—Pardon me. I think you will find I said, that "It might deserve all the ill that was said of it."

5765. You said that "It was quite possible that opium might deserve all the ill that had been said of it"?—Yes, that it might deserve all the abuse they were giving it; but that that was not the question.

5766. Sir J. Elphinstone.] Does the increased cultivation of opium in China enhance the price of food, rice and grain, for instance; has it gone so far as that?—I think it must have that tendency, but I do not know that it positively has done so, because there is a little misapprehension about opium growing; it does not preclude other crops, and they grow other crops on the same land. With their powers of irrigation and manure, they seem to find no difficulty in producing a crop of cereals from the same land as gives them their opium.

5767. Are the same bounties in regard to the importation of grain still in existence in China as formerly existed; are they always excused their tonnage dues?—Yes. One of the great objections always put forward by the Chinese authorities is, that the growth of opium does diminish the growth of food; and no doubt its tendency is that: you cannot occupy large spaces of land with opium without more or less curtailing the quantity of rice; and as the population is always pressing upon the means of existence in China, and when people are starving, they are always in insurrection and difficult to govern; of course the Chinese Government, which has not much physical means of coercion, is excessively alarmed at anything that threatens a diminished production of rice.

5768. In fact the great policy of the Chinese Government has been from time immemorial to maintain an adequate supply of food for its enormous population?—Yes.

5769. And anything that militates against that creates the greatest alarm?—Yes.

5770. Supposing that we were to entirely stop the exportation of opium from India, would it not give rise to a most unmanageable smuggling trade?—Quite so; and you will remember that the tenor of my reply to the ministers, when they pressed me so earnestly about it, was that even assuming the British Government were disposed to meet their views, it really would not

answer their end, though it would inflict a great evil upon us.

5771. I think the sea-board of China extends over something like 3,500 miles?—From the extreme north to the extreme south it would be about that.

5772. And that coast is fronted by an archipelago of islands with creeks and harbours, and, in short, is in every way adapted for carrying on a smuggling trade?—Precisely so. One of the emperor's titles is, "Lord of Ten thousand Isles," and that is hardly an exaggeration.

5773. Those harbours and inlets have from time immemorial been the refuge and the habitation of predatory tribes, over whom the Chinese Government have exercised but a very slight control, have they not?—Yes, they are the great haunts of pirates and fishermen, each alternately; it is very difficult to distinguish between them.

5774. In fact the fisherman is the disguise of the pirate?—Yes; and inasmuch as a large portion of the maritime population derive their subsistence from the sea, it is quite impossible that you can put down fishermen; and not being able to put down fishermen, the Government finds it equally difficult to put down pirates.

5775. The pirate masks his guns in his fishing net, and uses them when the occasion arises?—Yes.

5776. You do not think that it would be easy, even if the British Government did what I have suggested, for the Chinese Government to prevent a smuggling trade; you think that it would be beyond the control of their government?—I pointed out that till they could organise a steam fleet entirely in the hands of foreigners and foreign officers, just as they have done in organising their maritime customs, it was wholly out of the question their putting any check upon the smuggling. And then they would have to purify their fiscal administration probably by the same means; in order to obtain officers not so corrupt that they would always take bribes, and shut their eyes to any breach of the revenue laws: and that with those two difficulties existing until they were prepared to do something of that kind, it was quite hopeless and useless for the British Government to accept the sacrifice which they wished to impose upon them.

5777. And, in fact, the bribery system must exist under any government in that country?—Yes; it is so essentially corrupt, and, in fact, it is part of the acknowledged rights of an officer that he is to take fees.

5778. That is the acknowledged mode of payment of the officers of the government?—They are not paid any salary on which they can live, and if you under-pay your public officers, they necessarily get corrupt, and get paid by bribes; but in China they will not yet see what all other countries have learnt at last, that if you will have honest administrators you must pay them adequately.

5779. That system still exists of governors being appointed to provinces to squeeze as much as they possibly can get out of the people, and after a certain time the government come down upon them, and squeeze them in return?—From the governor generals to the lowest officials or office messengers, no man is paid enough to live upon; and any government that adopts that principle must make up its mind to have corrupt officers.

5780. Under these circumstances you hold it impracticable that opium can be excluded from

China by the force and power of the Chinese Government?—Perfectly so.

5781. I think you said that a man who smoked opium consumed about a mace worth a day; is that a person who smokes it to excess, or one who simply uses it as we do wine?—I think from half a mace to a mace a day, judging from all the information that has ever reached me from those best informed, would be about the same as a half pint to a pint of wine in this country.

5782. How much would you say for a man who smokes in excess?—I believe some of them consume as much as from one to eight drachms; from the eighth of an ounce to an ounce; that is when you come to the drunkard, to the hopelessly confirmed smoker.

5783. I once saw a calculation by which it was made out that a man who had come thoroughly under the influence of the drug smoked at the rate of 400 dollars a year; would you consider that he could do that?—I think that he might very well do it.

5784. Then, in point of fact, a man who can lay out 100*l.* a year upon a luxury of that description must belong to a very limited class; to the higher class of society?—Yes; he must belong either to the gentry who have accumulated money, or to the retired officials, or to the acting officials.

5785. In fact he must be a man of property?—Yes.

5786. And one great reason for the dislike of the people to opium is, that women and the families of the people who take it, find such a subtraction from their means that they are most strongly opposed to it?—Yes.

5787. With regard to the quantity, a mace a day comes to 10*l.* 4*s.* 7*d.* a year, taking a mace at 7*d.*; that even is beyond the means of the commonalty, is it not, of the coolies?—Yes; it must seriously press on the means of subsistence of their families.

5788. But taking those eating-houses where the Chinese coolies and the population generally dine in Chinese cities, where they get a dinner for two candarines, with a glass of weak wine and a pipe of opium; those people cannot possibly take it in such a quantity as to injure their health?—No, certainly not, in that proportion.

5789. Is it not the fact that from the corrupt and putrid nature of the food which these people live upon, some qualification of that sort is almost essentially necessary to health, and more especially in those malarious districts which exist on the courses of all the great rivers in China?—Yes; I have already observed that I thought opium might have a good sanitary influence used in moderate proportions.

5790. And taking that as a fact, and having regard to those who exceed in the use of opium, who are in fact synonymous with the drunkards in this country, the very great proportion of the persons who use opium must use it in a very moderate degree?—I do not think that I have any positive information that would justify me in giving any opinion upon that. My impression is that there must be a good many who do only smoke it in very moderate quantities, because I cannot see the possibility of their getting the means of purchasing it in large doses.

5791. Is it not the case (it was so in my time), that dysentery and diarrhoea and those complaints are much rarer among the Chinese who use the opium in a moderate degree, than they are amongst

amongst the European population who do not use opium except medicinally?—I cannot speak as to that, I do not know the fact. I should think from what I do know, that the Chinese suffer in quite as great a proportion, but I do not know anything very positive about it.

5792. The Chinese coolie is a very robust strong man, is he not?—He does a marvellous amount of work on his vegetable diet.

5793. And he is a very fine shaped man, a very muscular man, is he not?—There is a very fair proportion of them that are muscular, and certainly when they are working for themselves they will do quite as much work as any men I know.

5794. Allusion has been made to placards; the Chinese very frequently put up most offensive placards do they not, with regard to Europeans?—Certainly; and whenever there is any popular feeling got up, as, I believe, generally by the literati, and gentry, and officials, the placards abound.

5795. It is stimulated by those placards?—No doubt.

5796. But that is no new thing, is it?—Until late years we never inhabited any port but one, namely, Canton. Of course we were always the subjects of abuse there, and whenever there was any discussion with the authorities, the walls used to get covered with violently denunciatory placards.

5797. Are you aware that even in the Company's time those placards were frequently the subject of remonstrance with the Yamen?—Yes, and with no more effect than remonstrances now.

5798. Mr. J. B. Smith.] I think you stated that our exports of opium amount to something like twelve million pounds sterling?—Yes.

5799. Do you happen to know what is the total amount of our exports of all other articles to China?—From seven to eight millions pounds of British goods.

5800. Chairman.] The whole export trade in 1868 was 14,000,000 *l.* from India to China?—Yes.

5801. Mr. J. B. Smith.] What is the export of British manufactures from England to China. The increase in our trade in British manufactures to China has been less than with any other country, has it not?—Yes.

5802. But there has been a great increase in the opium trade?—Yes; but there has been an increase also in the trade in manufactures: there has been, in point of fact, an increase both in the opium and in the import of manufactured goods. It is a question of proportion, whether there has been as great an increase in the one as in the other. I believe that the increase has not been as great in the manufactured goods; but the complaint of the delegates is, that since 1865 there has been hardly any increase in the opium, in which I think the returns do not quite bear them out.

5803. During that time, from 1865, has there been an increase in the export of British manufactures?—Yes, they have been increasing.

5804. Then the falling off in opium has been made up by increased export of manufactures?—To a certain extent, it is probable that it would have that influence.

5805. And what do you anticipate would be the result of a diminution of our export of opium; would it increase the other portion of our trade?—I know that many of the merchants think so. It is a very difficult matter for me to give a decided opinion upon. I think that the tendency

0.59.

would be, that it would raise the exchange and increase the demand for foreign goods; and if it could be assumed that the Chinese would really spend less money on opium, of course they would have more money to spend on clothes.

5806. What is the value of the export of tea from China to this country?—We take about 120,000,000 lbs., at about 6 *d.* a pound on an average; from 6 *d.* to 1 *s.* may be taken as a fair average.

5807. Do the exports from China, taking the value of silk, and different articles which they produce, equal the amount of opium that we export to them?—The total exports to Great Britain and her dependencies in the year 1868 amounted to 16,631,129 *l.*, and to all other countries 4,103,294 *l.*; while the imports during the same period from Great Britain and her dependencies amounted to 20,318,475 *l.*, of which about 12,000,000 *l.* was opium. The imports from all other countries amounted to 1,677,116 *l.*

5808. You have told us that the Chinese Government have a most lively feeling of the enormous evils attending the import of opium and the consumption of opium in their country; and that you believe they are sincerely desirous of not only doing away with the growth of opium in their own country, but also of preventing the import of it from foreign countries?—Yes.

5809. Now, is there anything in our treaties to force them to take our opium?—Yes, it is put in the tariff of articles of import.

5810. Then they are bound to allow the free import of opium?—That was a condition introduced into the treaty which Lord Elgin made.

5811. Mr. Candlish.] But we do not enforce the purchase?—Not the purchase; but they cannot prohibit the import of opium: it is among the admitted articles on the tariff.

5812. Mr. J. B. Smith.] Then, notwithstanding that the Chinese Government are so sensible of the demoralisation of their people caused by the import of opium, they cannot prevent our sending it there; we force them by treaty to take it from us?—That is so, in effect.

5813. Chairman.] We have forced the Government to enter into a treaty to allow their subjects to take it?—Yes, precisely.

5814. Mr. J. B. Smith.] Is it any wonder that the Chinese Government complain of our conduct in that respect?—No, I do not think it is any wonder.

5815. What should we say if the Chinese imposed the like restrictions upon us?—I think that our answer to them for putting it into the treaty is, "You cannot prevent its being smuggled, and the lesser evil is to admit it as a legitimate article of trade."

5816. But is it not for them to judge of that, and not for us?—No doubt, if two nations are negotiating together on equal terms, each should have a voice.

5817. As regards missionaries, is there the same objection on the part of the Chinese to Protestant missionaries as there is to Roman Catholic missionaries?—No, I do not think there is. They do not make very much distinction, but they do know this distinction, and it is a very important one to them, that we do not assume any protectorate over the converts. Our Protestant missionaries do not assert it, and no Protestant power assumes it.

5818. Then all the Protestant missionaries that go there are subject to the Chinese laws, are they?—No, the missionaries are not subject to their

M M 4

Sir
R. Alcock,
K.C.B.
6 June 1871.

their laws; they of course are under the protection of ex-territorial privileges; but the Roman Catholic Governments go beyond that, and ex-territorialise their converts.

5819. What is the law with regard to Protestant missionaries?—That they are simply entitled to protection so long as they follow their vocation peaceably.

5820. But if the teachings of these missionaries be offensive to the Chinese, do you think that we ought to enforce their residence there?—Do you wish for my own opinion on that subject?

5821. Yes, if you have no objection to give it?—It involves a great many considerations; I do not think that we have any right to force even a religion upon them.

5822. Is there any hope of peaceable relations with China under these circumstances so long as we insist and force them to take opium from us, and force them to take our missionaries contrary to their own wishes?—No, I do not think there is any likelihood that we shall have any really cordial relations or good understanding with the Chinese authorities so long as those two questions do not admit of satisfactory adjustment.

5823. Is it possible to satisfactorily arrange these important points?—I have from time to time believed that they might admit of it, provided we could get the French Government to modify its policy on the subject of missionaries.

5824. But is it any reason that we should not be just because the French are not so?—Nothing that we could do alone would touch the evil. The great evil is that under the protectorate of France the Roman Catholic missionaries interfere between the civil power and Chinese subjects, and no abstaining on our part in reference to Protestant missionaries and their converts would, in the slightest degree, affect that which is the real ground of complaint. That was what I said to them when they were pressing me about the Protestant missionaries; they wanted me to introduce a clause in the convention; not that they really had much to complain of in regard to the Protestant missionaries in that way, but that it would serve them as a precedent in dealing with the French. It was in the time of the French empire, and knowing how little prospect or hope there was of the French adopting that policy, I pointed out that to introduce any restrictive clause in reference to our own missionaries without its really effecting the end which they had in view would be unnecessarily exposing the British Government to a great deal of hostile comment, and would not really benefit the Chinese Government.

5825. Have you heard of any Chinese publication which holds up the Protestant missionaries as very dangerous men, dangerous impostors, because their books tell them that they must love one another, and love all mankind, whilst they come and make war upon China, and bring opium and all kinds of evil upon the people?—There has been one publication which probably you are alluding to, the work of "A man most distressed in heart," who has collected all that has ever been said against the Christian religion or missionaries in China, and with infinite industry. It is a book full of all kinds of obscene and disgusting charges against the missionaries.

5826. But have you heard of that charge against them of acting contrary to the principles which they teach?—Yes; that is amongst the charges.

5827. That work is the work of a literary man, I suppose?—They say it is composed with a great deal of literary skill, and that he is a man of education, and has quoted from all the works on the subject that have been published in China in the last 200 years.

5828. Sir T. Bazley.] Does the consumption of opium shorten life at all?—I have already said that we are deficient in accurate statistics on a large scale which would enable one to decide the question with something like certainty. One can only speak vaguely from what one infers and what one sees in a more or less limited area. For that reason I have a great objection to speaking in any way categorically about it, but from what I know of the use of opium, and have seen of it in China, I have no doubt that it does tend to shorten life whenever used in any excess.

5829. And does the consumption of it tend to diminish the desire for food?—Yes, I should think so; and, to a considerable extent supply the want of food, just as smoking tobacco does, and the use of tea.

5830. Then by shortening life and diminishing the consumption of food, is not the agriculture of China much affected?—It would have that effect.

5831. Mr. Cundlish.] Is the hatred of the Chinese to the missionaries one which they cherish on account of their special religious teaching, or on account of their civil and political action?—I believe it is chiefly on account of their civil and political action under the French protectorate; I believe that is the gravamen of the offence. But you must understand that there are other causes in operation. In the first place, Buddhism is the professed religion of the great majority, and the rest are what may be called Rationalists; that is to say, they are Confucianists. In any case the missionaries, no doubt, in the discharge of their duty, think it necessary to point out the fallacy or error of these more or less idolatrous religions, and that cannot be a popular thing with people who give themselves up to them.

5832. But perhaps you would limit your answer to the professionals?—The Buddhist priests are really not men of much influence, but there are a great many Chinese, and especially amongst the women, who are more or less believers in these idols of the Buddhist religion. And the confessional must have a great deal to do with it, because, even in a Protestant population, it is a very unpopular thing for an officer of the church to walk into a household and to be closeted with the women one after the other; but what is it in an Eastern country, where for a woman to be seen even by any male but her father, or husband, or brother is a disgrace and scandal? What must be the feeling in China when they see that the moment this religion is introduced into a household the women, married and unmarried, are closeted with the priests? Of course they only draw one inference from it, which is that there is debauchery at the bottom of it.

5833. But I think you distinguish between the Roman Catholics and the Protestants?—Yes; I am speaking now of the Roman Catholics, who are much more in the interior, and are at the bottom of this special grievance.

5834. If the Chinese authorities were left unfettered by treaty obligations do you think that they would expel Protestant missionaries?—Every missionary; and they would exterminate their

their own converts. I believe they would do again what they did in the 17th century.

5835. Mr. *Grant Duff*.] Both Roman Catholic and Protestant missionaries would be expelled, you think?—Yes.

5836. Mr. *Candlish*.] The Chinese converts have received Protestant missionaries with some degree of cordiality in some places, have they not?—The missionaries say so, but, I think, not with a very decided tone. Of course they are received with varying degrees of indifference or of hostility; I doubt whether they are ever received anywhere very cordially.

5837. We have been talking of enforcing our religion; but we do not enforce it otherwise than through the intellect, do we?—We compel the Chinese authorities to abstain from any act that could interfere with the missionaries.

5838. Do you disapprove of leaving them free?—I think that we are bound to protect our missionaries if we allow them to go into the interior; we cannot give them up to the Chinese authorities, because it would be giving them up to torture and murder. But I do not approve of any means taken to force religion upon a people or a nation.

5839. You are satisfied that we rightly apply the word here when we say “enforce”?—Yes, I think it amounts to that; certainly it does under the French protectorate.

5840. You speak with less confidence as to the action of the English Government?—The Protestant powers generally, and the British Government more especially perhaps, have carefully abstained from ever supporting their missionaries in any interference between the civil authorities and their own subjects.

5841. You said that the sudden discontinuance of the use of opium on the part of a person who had been using it immoderately, would result in sudden physical collapse and death?—Yes.

5842. But you do not attribute the death to abstinence from opium, but to its previous immoderate use?—I think the system gets in that state that without the continuance of the stimulant, the powers of life cannot go on.

5843. But without its previous immoderate use, you would not anticipate any great evil from discontinuing it?—I think after moderate use it might be discontinued, with a great effort perhaps, but without much injury.

5844. You have also spoken of the use of opium in counteracting the bad effects of putrid food?—I think it is possible that it does. I have no sufficient data to justify me in speaking of it positively as a sanitary influence.

5845. Mr. *Grant Duff*.] Looking at the state of feeling in Western Europe, both in Protestant and Catholic communities, it is, very unlikely, is it not, that the resort of missionaries to China will ever now be stopped by the action of the Western Governments?—I think that if the Western Governments looked at the relations of the West with China in a large point of view, taking into account political and commercial as well as religious considerations, they might see that it would be to the interest even of religion not to press, in the way that the French Government has always done, missionary operations in the interior of China, with an amount of protection to the converts which rouses all this hostility, jealousy, and alarm, and which is creating an *imperium in imperio* that no government will submit to, except under force; and, therefore, I think that they

0.59.

might come to the conclusion that it would be better for the interests of peace and religion, as well as of commerce, that they should abstain from taking that course.

5846. But looking at the state of public opinion, it is hardly probable that at any time to which we can look forward the Governments of Western Europe will be able, even if they wished, either to take your enlightened view or to stop the resort of missionaries to China?—I think that the Chinese Government, if it felt stronger, could stop it at once; I do not think that the European Governments could prevent the resort of missionaries to China, but they could prevent its being so productive of hostility and irritation.

5847. But they could not prevent its being productive of hostility and irritation, could they?—I think, in co-operation with the Chinese Government, they could.

5848. Do you think that the opinion of the Catholic world, or the opinion of the Protestant world, would ever back either the Catholic or the Protestant Governments in putting such a check upon missionary operations in China as might make the resort of missionaries to that country agreeable to the Chinese Government?—No, I do not; I do not think that they could make it agreeable; but I think that they would take its chief sting away if they could agree among themselves, as I think might be possible, without doing violence to the Catholic feeling of Europe which you are describing—to protect their own missionaries from any violence or action on the part either of the populace or the authorities, but to absolutely abstain from interfering between the Chinese authorities and their own subjects.

5849. In short it would be necessary, speaking from the point of view of the missionaries, to sacrifice the converts to the Chinese Government?—That is to leave them to go through the stages which they have gone through in all periods of the world's history, whenever there have been any great conversions, that is to face martyrdom.

5850. Then as long as this missionary irritation is kept up do you think that the abatement of the opium irritation, in so far as it could be abated by the action of the British Government, would make very much difference in our relations with China?—I think it would; it would relieve us of one of two grave reproaches, and it would relieve the Chinese Government of one of two grave sources of anxiety. I think it would have an influence; it certainly would not effect the reconciliation of the conflicting interests and views of the two countries.

5851. But supposing that the British Government were to retire from all its treaty obligations with China, in so far as they concern opium, you have admitted to Sir James Elphinstone that opium would still be very largely smuggled into China. If that were so, would not the people connect the British Government with that smuggled Indian opium just as much as they do now with the imported opium?—That they would connect them with it, I have no doubt. Whether they would do it as much or not, I do not know; they would certainly connect us with it; and we should be mixed up with it a great deal, especially as it would be chiefly opium grown in India that would be so smuggled.

5852. Then the opium irritation could not be wholly abated unless we were absolutely to prohibit

Sir
R. Alcock,
K.C.B.

6 June 1871.

Sir
H. Alcock,
K.C.B.

6 June 1871.

hibit the exportation of opium from India?—No, we could not meet the evil in a radical way, unless we were prepared to sacrifice all cultivation of opium.

5853. And that would be inflicting a fine upon the people of India of about 7,000,000 £ per annum?—About 7,000,000 £, which is the revenue that we now raise from the Chinese in fact.

5854. That is to say, we should be depriving the people of India of an estate worth about 7,000,000 £ per annum?—That would be the practical result.

5855. Have you ever investigated the history of the growth of opium in China, and do you know how far it can be traced back?—Yes; Mr. Hobson, the commissioner of customs at Hankow, obtained some interesting information about that, which I have no reason to doubt is perfectly correct, and it goes far to show that we are more sinned against than sinning in reference to the first introduction of opium. It existed in Yunnan certainly before the beginning of this century. Mr. Hobson says, "The popular story in Szechuen is, that 100 years ago opium was introduced into Szechuen, Shensi, Yunnan, and Kweichow, from India and Thibet. At the time of the introduction it was esteemed for its medicinal properties only; but during Kienlung's reign it was discovered to be snokable, and the Szechuen people were among the earliest indulgers." But that the Chinese both cultivated the poppy in one or more provinces, and consumed it to the extent of many thousand péculs annually, long before there was any attempt to import the Indian drug, seems more than probable. We are responsible, therefore, to the extent of dealing in it and promoting its production in our Indian territories for the profit of the revenue during this century; but they certainly had it before, because in the latest edition of the "General History of the Southern Province of Yunnan," which was revised and republished in the first year of Kienlung's reign (A.D. 1736), opium is noted as a common product of Yung Changfoo. Now, as Mr. Hobson, the acting commissioner, well remarks, if 134 years ago so much opium was produced as to deserve notice in such a work as the one I refer to, it may be safely asserted that the production could be no novelty to the Chinese population at the beginning of the present century, when we first began to import it in small quantities. I think the importation in the beginning of the century was about 4,000 chests. In 1836 a certain Choo-tsun, a member of the Board of Rites, and a native of Yunnan, memorialised the throne regarding the cultivation of the poppy in his native province, and he then stated that the annual production of the drug could not be less than several thousand pounds. At that date the annual import of foreign opium was some 20,000 chests, 2,660,000 lbs. It was not till three years after that the Chinese authorities demanded the surrender of all the foreign-owned opium stored on board receiving ships in Canton waters, amounting to near 20,000 chests; which the Chinese (and our friends the Americans also) say was the cause of the war; they call it the "Opium war."

5856. Supposing that not an ounce of Indian opium entered China, do you believe, taking into account the want of power of the Peking Government in its remote provinces, and the direct interest of the mandarins in the other provinces,

to allow the growth of opium for a consideration that any apparatus of laws and decrees proceeding from Peking would really stop the growth of opium in China?—No, I have never contemplated that anything could be done by either or both governments combined, beyond restricting the area, and perhaps gradually diminishing it, so as to keep what they consider an unmitigated evil within limits.

5857. As to its being an unmitigated evil, does not the very fact of there being this passion for opium on the part of a large portion of the Chinese population, a passion which we cannot in the least understand, show that there is some want of it, dependent probably upon causes which are yet obscure to us?—Yes; to a certain extent I should agree in that view, because I have always had a conviction that a craving for something of a stimulating or narcotic character is universal.

5858. There is nothing more obscure than the causes which lead different nations to desire and to use some form or other of stimulant or narcotic?—That is so; there has been no country yet discovered, and no age of the world in which stimulants and narcotics of some kind or form have not been in use. They amount to more than 50; they are in every possible form; and yet no race, whether savage or civilised, has ever failed to discover them, although often by very recondite processes, sometimes by boiling roots, and by discovering the quality of narcotism or stimulus in the product by fermentation or distillation.

5859. And all experience shows that the desire for these stimulants are governed by influences which the legislator may watch, but in which he cannot effect sudden or violent changes?—Yes, I think so; I think it amounts to no more than controlling and watching.

5860. So that by attempting to effect through legislation any sudden or great change in the opium consumption of China, we might unwittingly be doing as much harm as good?—Quite so; first, it would utterly fail, it must fail; and, in the next place, all sudden revolutions of that kind must affect capital and industry, and could not fail to be a great evil. I have always objected exceedingly to any attempt suddenly to put an end to the opium trade, or to take any violent measure in that direction.

5861. Then all I understand you to say is, that you think the Chinese and British Governments might, if they thoroughly understood each other, and worked together, effect some regulation of the opium traffic that might be for the advantage of both countries?—Yes, they could regulate, but they cannot prevent, and they could diminish both the alarm of the Chinese Government and the absolute amount of the consumption. There was a minute made when I had communication with the council in Calcutta, which Sir Henry Durand, the writer, gives in a very few words what was the sum and substance of my views on that point. Remarking that I had arrived at the conclusion "that a compromise which gave the Government time and the Chinese Government the power, to assure their own anti-opium party that they had secured a reasonable co-operation on the part of the British Government would prove more favourable to the interests of the Government of India than allowing the Chinese Government to have recourse to the extreme measures it avowedly contemplates." He then states, as his own opinion, that a conflict between indigenous China

China opium and India opium was inevitable; that that conflict could only be met by leaving trade to its natural action and freedom, Government gradually withdrawing from the culture, and limiting its interference to the raising of such an amount of revenue by the system of license as the competition between the indigenous and the Indian opium admitted. There were three different views which I found prevailing when I went to India. One was that there was no competition to be feared, and I see that a writer in the "China Telegraph" takes the same view; he seems to be some merchant in China, who founds his opinion on the great superiority of the Indian drug, and the decided preference of the Chinese for it. Another, that there was a very dangerous competition already existing, and more to be feared. All the merchants engaged in the opium trade of India and China, as well as consuls, delegates, and commissioners of customs, are unanimous in that view. A third view was that competition being inevitable whatever British or Chinese authorities may do, there was only one way of dealing with it, namely, to promote cultivation and increase production, reducing the price to 1,200 rupees, a price which it was assumed would render competition impracticable. Sir Henry Durand and, I think, Sir Cecil Beadon both held opinions very much in accordance with this, concluding that whether the Indian Government withdrew from an active part in the cultivation or not, what they had to do was so to regulate the area and conditions of production and sale as to prevent the price getting so high that it must necessarily encourage either the Chinese cultivation or the trade from Turkey or Persia, to which there seemed to be a great tendency. From the Persian Gulf, already some 4,000 chests are sent in the year, and from the ports of Turkey, coming now through Egypt and Suez, more than 1,000, with a tendency to increase. My idea was for us, in co-operation with the Chinese, to agree to limit the area, to prevent its continual extension, and to have such an understanding that there need be no sudden displacement of capital or industry. It appeared to me that they might easily agree that only a certain area or a certain amount of produce should be permitted in either country from year to year; that it should go on diminishing on both at some fixed rate, *pari passu*, and that they should so work with each other that they could prevent its ever getting beyond a certain amount, provided always that they could see their way to prevent an increased quantity from Turkey and Persia supplying the void, which was a difficulty not to be overlooked. Limiting the area of cultivation, and regulating the taxation, putting it as high as you could, without increasing and stimulating the production of opium elsewhere, while the Chinese Government laboured, by such means as might best attain the end, to wean their own subjects from habits of indulgence or intoxication, and so lessen the demand, seemed to me to be the true policy for the present time.

5862. Mr. J. B. Smith.] Although the Chinese Government are bound to admit our opium, is there anything to compel them to admit the opium of any other country?—Inasmuch as in all the treaties there is what is called a favoured-nation clause, I presume that if any flag brought opium, no matter from whence, the Chinese could not exclude it.

0.59.

5863. Do other nations then get that clause inserted in their treaties?—They always have a favoured-nation clause, that is to say, a clause which says that they will have all the rights, privileges, and advantages given to the most favoured nation; and, inasmuch, as the admission of opium in the tariff is one of the rights and privileges secured to the British by treaty, it is in effect secured to all the other nations. Vessels under the flag of France or any other country might bring it in, and then they would claim a right under their flag; Persia, you may say, has no treaty, nor Turkey, but opium from both comes in under some other flag.

5864. Sir C. Wingfield.] Have not all these different treaties expired, that is to say, there is an opportunity now of renewing them, and it is optional with the Government to give notice to terminate them?—No; for instance, one of the treaties has no period specified at all, and we have at the end of 10 years a mutual right of revision only of the commercial clauses.

5865. But suppose the Chinese Government were to say, "We decline to admit opium; we will not renew the treaty, except on the condition of excluding opium altogether"?—I think they could only do that on the same principle as that on which Prince Gortchakoff declared that Russia would not submit to the continued neutralisation of the Black Sea; they must be prepared to fight for it.

5866. It is open to them to terminate the existing treaty?—They conceived that it was as regarded this and some other clauses, and in the revision of the existing articles they pressed it very much, but we did not feel bound to give it up, and they could not compel us except by such a process as I have indicated.

5867. It would not be a breach of treaty if they did terminate it, would it?—Yes, it would, if done without our consent.

5868. The treaty was for 10 years, and that has expired?—No, the treaty was perpetual; but there was a clause by which each party should have the right of demanding a revision of the commercial clauses.

5869. If they did demand a revision and we declined, then nothing could be done?—Nothing could be done then. However, in point of fact we did demand a revision and they went into the revision, and that was one of the things they demanded.

5870. In that revision they wished to put a higher duty, or they did put a higher duty on opium, did they not?—No, that was a concession that I made ultimately. I thought it an advantage; but the merchants did not like it. Inasmuch as the Chinese were insisting and urging, by every argument they could adduce, the necessity of the British Government consenting to the total prohibition of opium in order that they might be exterminated in their own view and with their own people from authorising and licensing it: I thought to get them to consent, when under no compulsion, to admit it as a legitimate article of commerce, and to take an increased revenue from it, was in fact getting them to take a retaining fee in our cause. I looked upon it in this light, and as a preliminary to the British and Chinese Governments coming to some arrangement of the nature which I have just been pointing out. By such means I conceived they might limit both production and consumption without attempting

6 June 1871.

Sir
R. Alcock,
K.C.B.
6 June 1871.

to put down the trade in opium entirely,—which I conceived to be an impossibility.

5871. By that treaty, which was not adopted afterwards by the Home Government, the duty was raised, was it not?—Yes, 20 taels; two or three per cent. on the value of a chest.

5872. Did not the Indian Government think that that was prejudicing their opium?—Yes, they did not like it; they said that already they found it difficult to compete with the Chinese opium, and it was weighting them in the race.

5873. I gathered from what you said just now, in reply to questions by Mr. Grant Duff, that your general view is this, that India opium could not be kept out of China unless the Government of India were not merely to discontinue the cultivation on its own account, but also to prohibit its exportation?—Yes.

5874. And you also say that the Chinese Government would not be able entirely to prevent cultivation in China, they can only restrict the area devoted to the production of opium?—That is to say, I doubt their being able to stamp it out utterly, looking at the usual corruption of their own people. They think that they can at all events; and they said that they would try if we would give them the power, by allowing its importation to be prohibited.

5875. Therefore the result is, that if we were to comply with their request, we should impose on India a loss of seven millions, which must be made up by extra taxation on our subjects with no certainty even of a compensating advantage to China?—Precisely; and that is the view that I exposed to the ministers. I said, “The only thing certain is a great loss of revenue to us, a great loss to merchants of capital engaged, and a very uncertain and doubtful benefit for you.”

5876. Mr. J. B. Smith.] As I understand you, you say that the Chinese have made a treaty from which it is not possible for them to escape?—It is not possible for them to escape from it except by a declaration that they will not submit to what they conceive to be injurious terms.

5877. The only way that they can escape from it is by a war?—A war, or a declaration that they are ready to go to war rather than submit any longer.

5878. Sir D. Wedderburn.] Is there any importation of Indian opium into Japan?—Merely for a Chinese colony that they have got at Nagasaki. The Japanese, I am happy to say, do not consume opium, but they drink hard.

5879. A former witness stated that in Western China, India opium was not consumed at all, but that they preferred the native drug. Is that your opinion?—Yes; there is a much larger consumption of native opium in the west than in the east. I do not know that foreign opium does not find its way there, or if it does not, I doubt its being because it is not liked, but I think that the expense becomes so enormous by the time it gets there as to exclude its use.

5880. Mr. R. Fowler.] I want to ascertain whether the Protestant missionaries in China

have any facilities beyond what in European countries we think the commonest facilities. They live, I believe, at the treaty ports, and simply make journeys up the country, and they do not go in any other capacity than as mere travellers. Of course I understand, as regards the Roman Catholic missionaries, under the protection of France, that there are very good grounds of complaint, but I am speaking of English missionaries, and I suppose that the same remarks would apply to the Americans?—As regards the British missionaries, they simply travel with the same rights and privileges that other British subjects do, but that involves extra-territorial privileges; that is, that they are in no way subject to the laws of the country; and that is what the Chinese object to.

5881. Mr. Candlish.] The treaty which we have with China, is, in point of fact, a treaty imposed on them by our superior power?—Most undoubtedly; there are a great many things in that treaty which they never would have consented to of their own accord.

5882. If they were a power equal to ourselves they would not submit to it?—They would abrogate it no doubt.

5883. Sir H. Lawson.] There is one thing that I want to have your opinion upon quite clearly. Do you not think that, supposing the English, *bonâ fide*, attempted to prohibit the sale of opium and gave up the present system, the Chinese Government, being backed up by the public opinion of the people of the country, it would be possible to have the trade prohibited, and virtually to put a stop to this great sale and consumption of opium in China?—I think the practical result would be very doubtful, inasmuch as we cannot be at all clear how far the Chinese themselves would succeed, either in preventing the cultivation in China, or in preventing extensive smuggling on their coasts.

5884. But I understand from your evidence that you consider that they are thoroughly in earnest in the matter, and that they are only prevented from doing anything by the superior power of England in forcing the sale?—That is the general tendency of my evidence, that they are honest in so far as they really desire, or would desire, to see the consumption of opium put a stop to, and that they feel that they are powerless in face of the determination of England to have it inserted in the tariff.

5885. Do you say that if that determination of England were altered, they would still be powerless to check or remove the evil to a great extent?—I think that it would be a great experiment; and the result, I am afraid, would be doubtful.

5886. Do the mandarins and higher officials wish to do away with it, or is it the people?—There is a very general popular sympathy with that wish, and a feeling that after all, though it may be pleasant it is very wrong, and does them mischief, and impoverishes and demoralises the nation.

Mr. CHARLES ALEXANDER WINCHESTER, called in; and Examined.

Mr.
Winchester.

5887. Chairman.] WHAT office do you hold?—I do not hold any now. I am retired.

5888. What office did you hold?—I was Her Majesty's Consul at Shanghai, and retired last year.

5889. Did you hear the evidence given to the Committee by Mr. Cooper?—Part of it, not the whole.

5890. Do you concur generally in the views that he expressed relating to the connection of the

the Chinese with the opium revenue and the opium export?—Yes, I concur with that part of it which I heard.

5891. Do you think that the evils which result from the importation of Indian opium into China are such as to render the continuance of that source of revenue to the Government of India doubtful?—I think not.

5892. Is it your opinion that the opium will continue to be consumed steadily by the Chinese in quantities equal to those at present consumed?—Yes, that is my opinion.

5893. You do not anticipate any great disturbing influences in China on the growth of Indian opium or otherwise?—No; I am convinced of the correctness of the opinion stated by the last witness, that there is a general taste for Indian opium, independent of the mere strength of its narcotic principles; I mean that they prefer it as a luxury in the shape of Indian opium to opium of the same strength grown elsewhere.

5894. Do you think that the consumption of Indian opium is likely to increase?—I think that it might increase, but it would fall in price as a matter of course if it did increase. I fancy that the Chinese take as much of it as they can well afford to do.

5895. At its present price, you mean?—Yes.

5896. Therefore any increase must result in a proportionate diminution of the price?—Yes.

5897. How long were you in China?—I went to China in 1842, and remained till 1868, in constant employment.

5898. Did you travel much into the interior of China?—Yes, I occasionally made journeys: I have not made any journeys of very great extent, but I have seen, naturally, during that time a good deal of the Chinese people.

5899. Had you much opportunity of communicating with Chinese of education and intelligence, and deriving information on this subject from them?—Yes, I saw a good deal of the opium trade, especially at the first port that I was attached to, namely, Amoy, where I was nine years, and which is a great opium mart.

5900. Did you find that the Chinese people whom you communicated with entertained the same view as you have now expressed, or did they differ from you in opinion?—No; I think that the Chinese satisfied themselves that opium was a stimulant which they must have, and whether good or evil they were willing to pay the price of it.

5901. Did the Chinese themselves anticipate any interruption in the consumption of opium?—I think not. I may say that, being a medical man, I was led to the conclusion that there was a certain aptitude in the stimulant to the circumstances of the Chinese people; they suffer greatly from febrile diseases, from diarrhoea and dysentery, and in many cases, I presume, that originally the habit of opium smoking was adopted in order to alleviate the annoyances and physical pain attaching to that class of diseases.

5902. Do you know to what extent opium is consumed in the Fen districts of England?—I have heard that it is consumed more there than in the other districts; and I attribute the determined predilection of the Chinese to that form of stimulant to the malarious character of the country, and the utter absence of all sanitary rules.

5903. Is this malarious character of China due to the natural state of the country, or to its excessive irrigation?—It is due to irrigation, natural
0.59.

and artificial, and which is very extensive, owing to China being permeated by the greatest rivers probably in the world; and to the fact that probably their system of manure exposes them to emanations which are more or less productive of fevers; and especially in the lower classes to the fact that they positively hate ventilation, and shut out fresh air rather than admit it.

5904. Mr. Cave.] Is the consumption of opium confined to the unhealthy parts of China?—No. I suppose that the consumption of opium is general all over China, but I know it only, of course, in the neighbourhood of the parts where I have been resident.

5905. Have you any reason to give for its being consumed in the healthy districts?—No; except that in reference to the use of stimulants we always see that it is their nature, as it were, to spread, to expand themselves.

5906. You think that it began on the coast and spread inland gradually?—The consumption of Indian opium certainly began on the coast and spread inland. I doubt if the consumption of Indian opium is nearly so great in the interior as along the sea coast; it must be more an article of luxury in the interior.

5907. But opium is grown in the interior, is it not?—Yes, the Szechuen opium.

5908. That did not spread from the coast, I suppose?—That, of course, did not.

5909. You have no theory upon the consumption of opium in the interior except that you think the taste spread from the coast?—I conceive that, looking to the amount of opium imported into China, we cannot suppose that it has reached the limit of possible consumption by so enormous a population as that country possesses; and I think that the use of both the native opium and the Indian drug is probably on the increase.

5910. But it has not that beneficial effect to which you have referred upon the consumer in the interior as well as upon the coast, I suppose?—I cannot speak as to that; I am speaking merely from what I have personally observed, which of course limits itself to inferences, from my residence on the coast.

5911. I wanted to see how far the inferences would go, because, if you state that the reason of its being consumed on the coast is from the malaria and unhealthy nature of the coast, of course that is a very reasonable theory, but that would not apply to other parts of the country, would it?—The same character prevails generally through all the warmer parts of China.

5912. Is there not a portion of the interior of China that is perfectly healthy where opium is largely consumed?—I have never been in Szechuen; I have been in Hankow, which is the highest point of the Yangtze that I have reached, and up to that point the amount of irrigation was enormous.

5913. Sir C. Wingfield.] Do you believe that the Chinese Government could, if they wished, prohibit the cultivation of opium in China?—I believe it is exceedingly unlikely, no matter what sincerity there may be on the part of the heads of the Chinese Government, that there ever should be a successful attempt to prevent the cultivation of the poppy in China, that is to say, looking to the whole character of the government.

5914. So that when they propose to us to co-operate with them to keep the Indian opium out of China they would be really stimulating the consumption

Mr.
Winchester
6 June 1871.

Mr.
Winchester.
—
6 June 1871.

consumption of the home-grown opium?—I do not know that that would be the object of the proposition; I should fancy that in such a proposal as Sir Rutherford Alcock has stated was made to him, they probably brought forward opium into the front of the battle for the purpose of fighting more successfully against the various demands that he made for enlargement of the commercial privileges.

5915. Then you think that they made opium a sort of stalking-horse?—Precisely so; but at the same time I wish it to be understood that I believe there is a strong feeling, on the part of the Chinese, that opium is a very bad thing, and that it ought to be put down. At the same time their virtue is not quite equal to the carrying out of these opinions.

5916. But if we were to agree to an arrangement of that kind, it is by no means certain that the end which the Chinese Government profess to have at heart, namely, the cessation of the cultivation and consumption of opium in China would follow?—I doubt very much whether it would follow.

5917. How do you reconcile the fact of which we are told, and which seems to be undoubted, that there is an immense consumption of opium in China, with the fact that at the same time there is a strong popular feeling against the importation and consumption of opium?—Very much in the same way as there is in this country a very strong popular feeling, on the part of many classes, against the use of intoxicating liquors; and that because they are known to be prejudicial to the population. In the same way there is no doubt that opium, as a stimulant, is attended by many evils and produces great miseries in private families; and looking to these, men who regard simply the evils that it produces say it ought to be put down.

5918. Then the bulk of the population are opposed to the consumption of opium?—If the bulk of the population are opposed to the consumption of opium, they nevertheless practise it.

5919. It is the minority that are addicted to the consumption of opium, and it is the majority of the population that are averse to it, is it not?—I can scarcely answer that question. It is chiefly amongst the literati and officers of Government that the expression of strong opinions against opium may be looked for; it is what you may call part of the official faith.

5920. The objection to it prevails among the upper and educated classes, in fact?—Yes; and yet my experience is that they indulge in opium probably quite as much as the mercantile classes do.

5921. But they disguise and conceal the habit, I suppose?—They disguise and conceal it very much. A Chinese merchant of a respectable character does not conceal from you that he takes an occasional pipe of opium. An official, a mandarin, who smokes probably the same amount, would conceal it, and would consider any allusion to the subject of his taking opium an offence.

5922. Have you ever been into the interior any distance?—I have made various excursions in the neighbourhood of the ports to which I have been attached, but I have never been travelling for days together by myself.

5923. Have you had opportunities of observing whether the effects of the use of opium are very deteriorating to the physical constitution?—There is a stage of opium smoking in which un-

questionably the effects are very deteriorating to the physical constitution; but at the same time my own impression is that a certain amount of opium smoking is not so; at least, taking the commercial population of Canton and Shanghai, which I have had opportunities of observing, the compradors, domestic servants, and others, who, as stated by Sir Rutherford Alcock, are very able men; quite equal to the work expected from them, well conducted and polite in every way, and do not show very marked symptoms of the evils of opium smoking. And I may say the same from having observed the Chinese in California also; there is no doubt that there, where there is no restriction of any kind upon the subject of smoking, the Chinese are a very honest, active, industrious class of people. And I believe that the same may be said of the Chinese in the Straits, where they certainly have kept themselves quite on a par with the Klings, Malays, and other native races, and where they are probably more addicted to opium smoking than they are even in China. I therefore presume that there is a large class who do not suffer such effects. I state the facts, so that the reason on which my inference is founded may be plain to the Committee.

5924. I believe that the Chinese in Australia, who are very numerous, all take opium?—I have never seen the Chinese in Australia. I know the Chinese in the Straits intimately, and I remained a few days in California, as I came from China, during which I made it my business to acquire as much information as I could about the Chinese population, and to speak with a good many of them.

5925. Mr. Cooper, the traveller in China, of whom you may have heard, said that his chair-bearers took a very large quantity of opium every day, and that if suddenly their opium was stopped they were in a state of perfect physical and mental prostration; and he said that if you were to suddenly stop the supply of opium to the Chinese, you would sentence a quarter of the population, or something like it, to death; do you agree with that statement?—There is no doubt about it, that to cut off from a man who has been in the habit of smoking, even moderately, the supply of his opium, is to subject him to a very great privation. That is probably the greatest evil connected with opium smoking, that it cannot well be stopped.

5926. Have you heard it said that it shortens life, and that few old men are to be observed amongst opium smokers?—I have known many old men amongst opium smokers, and men of all ages.

5927. Might those be prematurely old men, or were they men in advanced life?—Men in advanced life.

5928. Mr. Birley.] Assuming that the use of opium cannot and ought not to be prohibited, can you suggest any better mode of regulating the trade and importation from India, and the revenue derived from it, than that which at present exists?—Do you mean in China, or in India?

5929. I conclude that your experience has been in China, and, therefore, of course I should ask you as to what you have had an opportunity of observing there; would your experience dictate any better mode of regulating the trade as regards the introduction of the drug into China, and the revenue derived by the Indian Government

ment from it?—Opium, as it is being introduced into China, is at a disadvantage as compared with other articles of commerce, in so far that it is not protected after its first introduction. The Chinese government are bound to admit it on a payment of 30 dollars, but they are not restricted as to the duties which they shall levy on opium after it has left the hands of the foreign owner as they are in reference to piece goods and other articles of commerce.

5930. I think we had it touched upon by Sir Rutherford Alcock just now, but the treaty which he proposed in China was to have added somewhat to the duty on opium, and to have freed it from all the transit duties, was it not?—It was a simple addition to the duty which he proposed, and that was the foundation of the objection made by the mercantile community; but I may state that I should think it very desirable that if the duty were to be increased, opium should be put upon the same footing as other articles of commerce, that is to say, provided the Chinese government can be induced to consent to do so.

5931. Mr. Beach.] Did you observe any difference in the effects produced by Indian opium and Chinese opium?—No; I have never seen any difference in the effects, because I do not believe that the class of opium smokers with whom I have principally come in contact, that is to say, persons who were either merchants or officers of Government, ever did smoke native opium, they so much prefer the Indian. The statement of the Chinese is that native opium is sour and hard; and, I believe, that the Turkey and Persian opium which is introduced into China, is chiefly used for mixing with the native drug; but unquestionably the preference of the classes of the opium smokers on the coast for the Indian drug is very marked indeed. I may mention a fact which the Committee may perhaps have been informed of before, which is, that at Canton and in the South of China Malwa and Patna are bought in almost equal quantities. In Fokien, at Amoy, and Foochow the Bengal is the favourite drug, and there is very little Malwa bought. And a more extraordinary fact is, that at Amoy the consumption is principally of Benares, which is sent to China in a very limited stock; a goodish portion of the Benares sent to China is taken off at that one port. Again, at Shanghai Malwa is in principal demand, and the Bengal drug is in very little demand there. In Shanghai Turkey opium is almost never sold; it is sold generally in the South of China, when it is supposed, I may say, to be mixed with the native opium; but at Shanghai it is very little sold.

5932. One statement that we had was, that the Chinese preferred their own opium to a certain extent, because they could smoke the more of it from its being coarser; what do you say as to that?—That is not in accordance with my experience; but I may draw the attention of the Committee to the fact that Turkey opium, which is certainly very much stronger as regards morphia, has never until very lately reached the price which the Bengal drug, containing a less quantity of morphia, has reached; therefore, if one is merely arguing from the strength of opium as to whether the Chinaman will prefer an opium because it is strong or because it is weak, that does not fulfil the conditions which make opium palatable to smokers.

Q.59.

5933. Sir W. Lawson.] I understood from you that the bulk of the inhabitants of China would be glad to abstain from this opium, and would think it better to do so, but they cannot resist the temptation when it is put before them?—Well, I believe that there is a theoretical impression very widely existing in China, that it would be desirable to abstain from opium; I certainly think that.

5934. The facility of getting it is the temptation that leads them on?—Yes.

5935. I think you said that you were a medical man?—I studied medicine, but I have not been practising.

5936. Would you recommend persons who lived in close rooms without much air, to smoke opium?—I believe that I would not recommend any man to smoke opium under any circumstances.

5937. Mr. R. Fowler.] You have had experience of the effects of opium on the Chinese who take it, I presume?—I have observed the effects; I have never smoked it myself.

5938. But it would be your opinion that it has a very prejudicial effect on the health of the people?—On the whole, I should say yes. But there are two conditions of opium smoking; there is what you might call the moderate opium smoking, and there is that stage which I would call opiumism, as being equivalent to what may be called alcoholism. I think you must view these two different conditions as entirely separate, in considering the effect of opium on individuals.

5939. Sir Rutherford Alcock expressed a doubt whether people ever remained moderate smokers. What would be your opinion on that point?—My opinion is rather more in favour of the view that they do. And it is derived from my observations upon the general activity and energy of the Chinese, both in the neighbourhood of the ports, and in the Straits, and in California from their being on the whole a useful people, and a laborious diligent population.

5940. Then it is your opinion that a man may continue to use opium as we use wine and the lower classes use beer in this country, without ever being induced to use it to excess?—Yes, I feel sure of it; I have known men who told me that they had smoked opium all their lives, and who were perfectly competent to all the duties of their position.

5941. And who were elderly people?—People of 40 or 50.

5942. Any of 70 or 80?—Men of the usual ages in private life.

5943. When a man accustomed to a large quantity of opium is deprived of it, the effect is dreadful, is it not?—The more opium a man indulges in, of course the greater must be the effect of its withdrawal, and as I have already said, it must be very cruel indeed.

5944. Sir J. Elphinstone.] With regard to the question, in a medical point of view, the great proportion of China consists, does it not, of those great alluvial valleys, which are in most cases malarious?—Yes.

5945. All are at certain seasons of the year, are they not?—Yes; I should say all of the south of China.

5946. I think you said that it was your opinion that the inhabitants of those portions of China were benefited by the moderate use of opium?—I have no doubt that they take it to relieve themselves; that the foundation of the habit of opium

Mr.

6 June 1871.

Mr. Winchester.
6 June 1871. opium smoking was the temptation to relieve those symptoms of annoyance and of physical pain consequent upon the class of diseases to which they are subject.

5947. Consequent upon these dysenteric diseases?—Yes.

5948. Is not this use of stimulants, which is common to every country, a sort of instinct of the natives of that country to meet some contingency in the atmospheric or physical influences of the country?—I verily believe so.

5949. How much money does it take in the year for a man to make a sot of himself with opium; what would be the money value of the quantity of opium that a man will consume who is habitually abandoned to the use of opium, who is in the secondary stage, in fact?—I never have made the calculation, but I presume that 400 or 500 dollars a year would be a very liberal consumption of opium, and likely to carry a man far into that stage.

5950. We will take, first, a man in the secondary stage; do you suppose that a man in the secondary stage requires 500 dollars' worth of opium in the course of the year to maintain him in the degree of comfort which is necessary for his debilitated frame?—He requires a large quantity of opium, no doubt, to maintain him in that state, because the opium he does take has less effect on him.

5951. You would not be surprised at 500 dollars' worth?—No.

5952. One hundred dollars being worth 25?—Yes.

5953. So that he requires to spend a sum of 125? per annum to maintain him in that state?—Yes; I do not think that an extravagant allowance for such a man.

5954. Then, of course, the indulgence in the drug to the extent of the secondary stage can only be confined to persons in easy and affluent circumstances?—Certainly.

5955. We will go now to the primary stage; what are the wages of a Chinese coolie; four dollars a month?—Yes, about four dollars a month would be fair wages.

5956. How much opium would a man in that grade of life consume, maintaining his physical powers to earn that amount of wages?—He could consume very little; almost an infinitesimal quantity.

5957. But that infinitesimal quantity which he consumes, taking it to be spread over the whole population, as we are told, is a valuable adjunct to the nature of the food which he consumes, is it not?—Well, I fancy that a coolie very often does not smoke opium regularly every day, but when he has accumulated a little money and meets his friends he goes and has a blow-out.

5958. That does not affect his general health?—No.

5959. So that, in point of fact, the curse of opium smoking is confined to those people of money and leisure who are capable of laying out a large sum of money in the year upon their personal gratification?—Certainly; to people in easy circumstances.

5960. And therefore it cannot be that great national curse which we are habitually told it is?—I would say that of course there are a great many cases of misery and distress arising from opium, but I consider that there is a great deal of exaggeration in the amount of the evil attributed to it.

5961. And, as I understand you, there is some degree of good in the antidote which it forms to malaria and to deleterious food?—There is no doubt that it much relieves pain and suffering.

5962. There is no difficulty whatever in Chinese towns in going into those opium-smoking places, where you see those wretched spectacles of human infirmity?—None.

5963. I suppose that if you were to make a similar pilgrimage into Wapping, or the lower haunts of vice and misery in this country, you would find an equal number of people in quite as despicable a position?—Quite. No respectable Chinese will smoke opium in opium shops.

5964. They are given up to abandoned persons?—They are given up to people who are abandoned to the use of the drug, who are subject to the second stage of the disease.

5965. But who are still in that degree of pecuniary ease that they are able to afford a very large sum of money per annum for their gratification?—Yes.

5966. Mr. Candlish.] The taste for opium and its consumption in China is of modern date, is it not?—The taste for the consumption of Bengal opium is certainly of modern date; not much older than this century, I believe.

5967. Do you think that the taste for it in China, on the coast of China especially, has been generated by the native-grown or by the imported opium, speaking of opium generally?—I presume that the taste for smoking opium is due to the original growth of Chinese opium in the provinces in which it has been grown for at least a couple of centuries.

5968. And you think that we have not increased the consumption by our importations?—We have increased the consumption, undoubtedly.

5969. Largely?—That I cannot say.

5970. To the extent of our imports, would you suppose?—Yes.

5971. Has the native growth diminished?—Certainly not. I believe that the native growth has increased. It was increased very much, in my opinion, after the Indian mutiny.

5972. To the extent of our imports then we have increased the consumption of opium; at least that, and more than that?—Yes.

5973. You said that some good results from the use of opium?—Well, the use of opium is one of the greatest blessings given to man.

5974. In the hands of a medical man?—Yes; and I believe that very often the smoking of opium must act in the same way on pain and suffering and anomalous symptoms as the use of opium administered medically.

5975. That may be the immediate effect, but it may be at the expense of ultimate mischief in another direction?—Yes, in the same way as is true of the use and abuse of any stimulant.

5976. If opium were withdrawn from China altogether would it be a great Chinese calamity?—I think that what you are supposing is a physical impossibility.

5977. I am asking you for your estimate of its action, beneficial or otherwise?—My mind cannot estimate the results of facts which it considers impossible.

5978. Has our export of opium from India, and its import into China, resulted in a balance of evil or good to the Chinese?—That is a question that I have never put to my own mind; I never thought of determining it in that way; but I do not

not hold the view that opium is an unmixed evil.

5979. *Chairman.*] Having regard to your previous evidence, do you think that the Chinese would suffer more from fever, ague, and other results of a deleterious climate, and of unwholesome conditions of existence, if they were deprived of opium, than they do suffer from the consumption of opium, either in a moderate degree or in excess?—I think that if you were to make sure that the Chinese would use it in a moderate degree, then you might consider the export of opium to China on the whole a blessing; but my position has always led me to look upon the question more in a practical light as to what I have seen than as to determining the moral question.

5980. But speaking of the physical question, having regard to the consumption of opium in excess; do you think that the suffering of the Chinese from the diseases and injurious influences that you have mentioned is greater or less than the suffering from the consumption of opium in excess?—I should say that the balance was in favour of the relief given by the stimulant over the actual misery created by its abuse; on the whole, I am inclined to form that opinion.

5981. *Mr. Candlish.*] You have spoken of great miseries and many evils as resulting from the use of Indian opium in China; the diminution of the import and withdrawing of the Indian opium would rid China of those evils at all events?—No; I should say not as long as native opium was grown and used.

5982. Assuming the increased consumption to be in proportion to our exports, we should lessen the evil by that amount?—If there were no opium, there would be no evil effects from opium; in that sense, it is so.

5983. Then the evils will have increased in proportion to our exports?—Yes; and the benefits too, if there are any.

5984. You said that the moderate use of it, a

certain amount of smoking, was not so injurious; do I rightly understand from that, that all smoking is injurious?—Inmoderate smoking must be injurious.

5985. You said that a certain amount of smoking was not so injurious; am I to understand from that answer that all smoking is injurious?—No, not injurious to the same extent. I mentioned, if you remember, that having observed several classes of persons in the Straits and in California, and the Chinese in more immediate contact with the Europeans at the different ports, I had found that these persons, on the whole, were active, industrious, well-conducted, and quite equal to their work.

5986. Shall I take the other view, that the export of opium from India to China is not merely a commercial advantage to those engaged in it, but beneficent to the Chinese?—I believe that it is an article of commerce which supplies some wants that the Chinese have very strongly.

5987. And the gratification of that want is beneficent and beneficial?—I do not say entirely so; it may be indifferent.

5988. Then, in your opinion, is it on the whole beneficial or injurious?—Well, all stimulants have a beneficial use and an injurious use. I consider that opium has both.

5989. Is the opium that we send to China on the whole beneficial or injurious to the Chinese; can you answer that question?—I would rather not answer the question categorically; I scarcely think that it admits of a categorical answer.

5990. If, as some contend, it is only evil, and that continually, should we not benefit the Chinese if we levied on them a direct tribute of money instead, equivalent to the profit that we make by the opium that we sell them?—I should think that the Chinese would much rather pay us in consumption of opium than pay us a direct tribute. I cannot imagine any one country exacting such a tribute from another.

Mr. JOHN NUTT BULLEN, called in; and Examined.

5991. *Chairman.*] HAVE you been in India?—Yes.

5992. How many years have you been there?—Twenty-three years.

5993. What occupation did you follow while you were in India?—That of a merchant.

5994. Have you acquired a considerable knowledge of the exports from, and imports into, India?—Yes; trading was my business whilst in India.

5995. Where did you reside?—In Calcutta.

5996. Have you directed your attention at all to the tariff of duties levied by the Government during the period of which you speak?—Yes, in a general way.

5997. Can you state what is the general effect of the tariff upon the principal articles, the staples of commerce?—As far as regards the export tariff, apart from the general objection to all export duties, there is nothing very much to complain of except the heavy export duty on grain; on rice, that is to say, and other grain. In other respects, the export tariff is moderate and liberal.

5998. The export duty on grain affects rice chiefly in Calcutta?—Not only from Calcutta, but also from the Eastern ports in Burmah and

Aracan, where rice is almost the only article of export. *Mr. Bullen*

5999. Do you consider that the duty levied on the rice seriously interferes with the quantity that is exported?—That is a very difficult question to answer. The export has, no doubt, fallen off since the last increase of duty took place.

6000. When was that?—I think the last increase was in 1867. The duty previously to that was two annas per maund; it was then increased to three annas per maund. Since that there has been a falling off in the quantity exported; but that falling off may have arisen from other causes.

6001. Has the falling off been steady during the whole period?—No. In the last 12 months the export has rather increased again.

6002. Do you consider that the export duty falls upon the consumer of the rice in the place where it is sent, or does it seriously interfere with the price of the rice at Calcutta, or any other part?—In the case of India, I think it falls principally on the producer, inasmuch as the rice comes into competition in foreign markets with rice produced elsewhere.

6003. You think that the price of rice in Calcutta

Mr. Winchester.
6 June 1871.

Mr. Bullen. cutta is regulated by the price of rice from other countries?—To a great extent.
 6 June 1871.

6004. Then, ultimately, the duty would fall upon the grower?—Yes.

6005. To that extent it would be an addition upon the revenue collected from the land?—No doubt.

6006. Is there any other article of export which is materially affected by the duties levied on export?—I think not; in other respects the export tariff is very moderate.

6007. Has your attention ever been called to the export duty on saltpetre?—Yes; it no longer exists.

6008. But when it did exist, what was the effect of it?—The effect of it was, no doubt, very seriously to interfere with the export of saltpetre from India.

6009. And since the duty has been remitted has the export recovered?—To a certain extent it has; but the effect of the heavy export duty on saltpetre was to encourage chemists in Europe to search for, and ultimately to discover, a substitute for the Bengal saltpetre.

6010. That is to say, some form of nitre?—Yes; an article produced by a combination of muriate of potash and nitrate of soda.

6011. To that extent, therefore, the duty had the effect of producing a successful rival to the Calcutta saltpetre?—No doubt.

6012. But since the remission of the duty, has the export been steadily increasing?—This substitute having obtained a certain footing in the markets principally of the Continent of Europe, it is very difficult now for Bengal saltpetre to displace it; in fact, the artificial saltpetre is produced at almost as low a price as the Bengal saltpetre can be sold at, even when freed from duty.

6013. Is there any other article of export which is materially affected by the duties levied?—Not in the export tariff.

6014. To pass now to the import tariff; have any questions arisen respecting the duties on the importation of merchandise?—I do not consider myself that the import duty on cotton piece goods, which is the article on which the greatest duty is levied, is objectionable so long as it is levied at the moderate rate of five per cent.

6015. Has that undergone several changes?—Yes. When Mr. Wilson went out in 1860, when the finances were in a very disorganised state, owing to the expenditure attendant on the suppression of the Mutiny, or, rather, it was done before then, by Lord Canning, the duties on nearly all imports were raised from five per cent. to 10 per cent.

6016. Did that increase of duty affect the quantity of imported articles?—It must have done so, because it increased the price to the consumer.

6017. Was that the result as a fact, and not speaking theoretically merely?—There is always a natural growth of trade in India. If the trade was not interfered with, it would increase probably 5 to 10 per cent. every year. The effect of that increase of the duty was to check that natural increase of trade for a time.

6018. Did it act in any way as a protective duty to native manufactured goods?—No doubt it did.

6019. I ask not speculatively, but as a fact?—I am unable to answer that question of my own knowledge, inasmuch as there is very little manu-

facture of native cotton goods in the Lower Provinces of Bengal.

6020. Was there any importation then into the Lower Provinces of Bengal from other parts of India of native manufactured goods?—I think not.

6021. Did you hear at all whether there was any increase of the native manufactures in the Lower Provinces of Bengal, small as they are?—No, I think not.

6022. Then we may take it that the increase of the import duties to 10 per cent. did not, in point of fact, increase the Indian home manufacture?—I am speaking solely of Calcutta. On the Bombay side, no doubt owing to the protection afforded by these 10 per cent. duties, a very large amount of capital was invested in spinning and weaving mills.

6023. In Bengal was there any increase in the number of mills over the solitary mill in Calcutta?—I think there are either one or two now existing besides the one of which you speak.

6024. Do you know when those were established?—One was established, I think, about five years ago, and the other more recently.

6025. Was that established during the levying of the 10 per cent. duties?—No, that was established since the duties have been reduced to 5 per cent. again.

6026. Do you know as a question of fact whether, in establishing that mill, the five per cent. duties formed a ruling element, or whether it was to a much larger extent a speculation for profit?—No doubt it was an element in the calculation.

6027. Do you think that a revision of the five per cent. duty would affect the question of the mills?—If you mean to ask whether the shareholders, if they had supposed that the five per cent. would have been withdrawn, would have abstained from that speculation, I do not think so; it would not affect it to that extent.

6028. Is that only a spinning mill?—Spinning and weaving.

6029. Is that still in operation?—Yes.

6030. Is it a successful enterprise?—Yes; paying a dividend, I think, of 10 per cent.; that is the new mill of which I am now speaking.

6031. Does the old mill continue to pay any dividend?—I must explain that I left Calcutta in 1866, and what has taken place since then I cannot speak to of my own knowledge; I believe that the old mill, the machinery having gone very much out of date, is not working properly.

6032. Perhaps we cannot tell the result of the new experiment if we do not know whether the machinery is being kept up or not?—No.

6033. Is there any other particular article of import that you think is affected by the duties?—The duties on metals appear unduly high, and there has been an agitation frequently in India to get them reduced to the old level of five per cent.; they are now 7½ per cent.

6034. Would the duty on metals in any way operate as a protective duty to the manufacturers of India?—No, not at all.

6035. I presume it would require a very large duty to stimulate any production of iron in India?—I do not think that the iron ore exists; or, if it does, not anywhere where fuel is available; so that it could not be made.

6036. Except at great expense?—At great expense.

6037. Therefore,

6037. Therefore the duty has been really a charge on the iron upon the consumer?—Yes.

6038. Do you think that the $7\frac{1}{2}$ per cent. duty has the effect of diminishing the consumption of iron seriously in India?—The duty on iron is only 1 per cent. I spoke generally of metals when I said $7\frac{1}{2}$ per cent.; all other metals pay $7\frac{1}{2}$ per cent. I am not speaking of pig iron; I am speaking of iron in bars and sheets. Iron-mongery pays $7\frac{1}{2}$ per cent.

6039. Do you think that the industry in copper or the importation of copper, and the consumption of it, is in any way diminished by the $7\frac{1}{2}$ per cent?—It is diminished to this extent, that no doubt the consumption of articles manufactured of copper or spelter or other metals would increase if the duty was lower, because they could be sold at a lower price to the consumer.

6040. But is there any great importation of copper articles into Bengal?—No.

6041. The native manufacture is either cheaper or more adapted to the native wants?—Yes, it is so.

6042. So that practically there is no importation of domestic copper articles into Bengal?—No.

6043. And is there any large importation of ironmongery?—Yes, there is a large importation of ironmongery, if you include under that term cutlery, and all kinds of instruments of agriculture; hoes, and things of that kind.

6044. Do you think that that importation is much checked by the $7\frac{1}{2}$ per cent. duty?—I cannot say that it is much checked, but of course it is checked to a certain extent.

6045. Are the commercial charges on the importation of goods into Bengal very high?—No, I think not; the freight is low.

6046. How much would the merchandise be enhanced from the importation price, the price which is paid for the goods before they get into the hands of the retail seller in Bengal, by the time it has passed through all the European and native wholesale hands?—That is a difficult question to answer. The merchant is usually satisfied with a profit of 5 per cent.; if he gets 5 per cent. over and above the cost, with interest, he considers that a good profit; but what the native distributor considers a good profit I am not able to say.

6047. What is the difference between the invoiced price on arriving at Calcutta and the actual retail price to the consumer, in fact?—I could not answer that question.

6048. Would it be 50 per cent.?—Scarcely that, I think.

6049. Do you know whether the mercantile community in Calcutta have any serious objections to the present tariff in any other of its details?—No; I think that that is the item which is now most seriously objected to, the heavy import duty on metals.

6050. Do you think that the duty on any other goods imported might be increased without materially diminishing their consumption?—No; because I hold that any increase to the value of an article (that is to say, the price at which it can be sold) does *pro tanto* diminish the consumption.

6051. That is the theoretic view; but I am speaking of the practical view, because we know that practically it is not always so; for example, the duty on spirits in England has been increased from 3s. or 4s. to 10s. a gallon, and yet the quantity consumed, though not increased, has not

diminished: I am asking whether the duty could be increased without diminishing the consumption of any article practically?—I hold not. I hold that it is not only theory, but practice, that any increase to price caused by increase of duty does tend to check the consumption.

6052. But do you think that there would be any increase of native production unduly stimulated by the increase of the duties on any imported goods to 10 per cent., which they formerly were?—Cotton goods, do you mean?

6053. I mean goods in general, manufactured articles?—I am unable to answer the question of my own knowledge, because there is very little manufacture of native cotton goods in Lower Bengal, and I cannot say what would be the effect of an increase of duty on the production of the Upper Provinces.

6054. Mr. Care.] Is there no cutlery made in India?—There is some, but it is of a very inferior description.

6055. I thought that the armour and military weapons of India were rather celebrated?—At any rate they are not made in Lower Bengal. They are made about Benares, I believe, principally.

6056. Where does the iron or steel from which those are made come from?—I said before, that there is very little ironstone in India, but I must correct that; there is ironstone found in India, and from that a very superior description of iron is smelted.

6057. The native cotton goods, I think, are worn chiefly by the upper classes in India, are they not?—I should say not; I should say that the Manchester cotton goods are now what are most worn by the well-to-do classes; the native manufactures are worn by the lower classes, being thicker and more durable than the Manchester manufacture. If you speak of the fine Dacca muslins and very expensive cloths made at Dacca, that is the case, but that is a very small trade comparatively.

6058. In that case, whatever increase of price is placed upon them by the duty is borne by the upper classes rather than the lower, which of course is an advantage?—Not only by the upper classes, by the upper and middle classes; in fact, in Bengal the whole population is now coming to be clothed with Manchester goods, the price being lower than that of the native manufactured articles.

6059. Is it the fact that the price of the Manchester goods, plus the duty, is lower generally than that of the native goods?—In some descriptions it is so, in some descriptions it is not.

6060. Taking the same quality of article worn by the same classes and the same persons, do you mean?—I do not know that I could give any precise reply to that.

6061. How are the cotton goods made in India?—Mostly by handlooms.

6062. The expense of which would be very much greater than that of the steam-made produce of Manchester, would it not?—Yes; except that they are made principally by women who make them in their intervals of leisure from other occupations.

6063. You excepted pig iron from your answer just now; for what reason did you except it?—I did not mean to except pig iron, because it pays the same duty of one per cent. which all other iron pays.

6064. You said that the export duty on salt-petre

Mr. Bullen.

6 June 1871.

Mr. Bullen. petre had the effect of limiting the trade, did you not?—Yes, that it checked the export.

6 June 1871. 6065. And where was it that the substitute was found?—The process of manufacturing a substitute was discovered in Europe, in France.

6066. But had not the discovery of beds of cubic nitre in the Pacific something to do with the diminution of the export trade from India?—The price of cubic nitre did become lower about that time, I believe; but the difficulty was not with the cubic nitre, but with the potash used in combination with it, and that has only in the last few years been found in large quantities. It has been found almost in a natural state, I believe, in Silesia.

6067. All that probably would account for a diminution of export, even without the export duty?—I think, very likely, if the Bengal saltpetre had remained at its normal price, the ingenuity of chemists would not have been exercised in discovering a substitute; but the price having been increased to the extent of 5s. or 6s. by this duty, there then became a very large margin of profit if a substitute could be produced at about the old price of the Bengal saltpetre.

6068. Do you think that the export duty was so burthensome that it really did drive people to look out for a substitute?—I have no doubt about it.

6069. Can you say whether an increase in the import duties, on any article, could be made without diminishing materially the trade?—I think I answered that question before; to the extent to which you increase the duties, my impression is that you would check the consumption.

6070. Do you think that it would be checked to that extent that it would defeat itself, and that the revenue would suffer?—It would suffer at first. Of course in the course of years the growth of trade, of which I spoke before, would bring it up to the old level of consumption; but there would be a check at first, I have little doubt.

6071. What has been the cause of the growth of trade in India?—The general increase of the wealth of the population.

6072. The wages have risen much higher?—Yes, and railways have given much more occupation to the people.

6073. That being so, the population would be better able to pay an increased price now than they were a lower price 10 years ago, I suppose?—Yes.

6074. So that by carefully adapting the increased duties to the state of the country, you might increase the revenue without placing an undue burden on the people?—Yes.

6075. It being the object of course to get the revenue in as little burdensome a way as possible?—Yes.

6076. And if it did not affect the people in such a way as to induce them to curtail their consumption materially, it would not affect the import?—That is so.

6077. *Mr. Crawford.*] Was not the invention of an article to compete with saltpetre in Europe a thing which followed very soon after the enhancement of the duty in India?—It did, almost immediately.

6078. Did you ever hear that that effect was predicted in this country?—I cannot say I heard that it was predicted, but it was said almost immediately after the great increase of duty took place that a substitute would be found.

6079. Do you draw a connection in your own

mind between the raising of the duty in India and a substitute being discovered here?—Yes.

6080. What is the export duty on linseed?—Three per cent.

6081. Do not you think that that falls as hardly on linseed, considering it has to undergo a competition with the Russian linseed in this market, as the duty on grain to which you have referred?—In the latter case it is much larger; the duty on linseed is 3 per cent., and on grain it is 3 annas per maund, which is equal to 9 or 10 per cent.

6082. Still, to the extent of that 3 per cent., the linseed brought to this country from India is overweighted as against the Russian?—Yes, it is at a disadvantage, no doubt.

6083. What is the duty on indigo?—Three rupees per maund, which is about 1½ per cent. on the ordinary value.

6084. Nearly a penny a pound?—Three farthings to a penny a pound.

6085. Three farthings to a penny a pound is a considerable addition to the price of a low description of indigo, is it not?—Yes.

6086. What do you put the low description of Bengal indigo at, 2s. 6d. to 3s.?—Yes, it is worth about that now.

6087. And that is equal to an imposition of a 3 per cent. duty here?—Yes.

6088. You were speaking just now of copper; the duty on copper is 7½ per cent., is it not?—Yes.

6089. Upon all copper?—Yes, upon all kinds of copper.

6090. Including copper manufactured, as it is termed, as sheet copper and braziers' copper, as distinguished from tile copper?—Yes.

6091. But there is no importation of manufactured copper utensils into India, is there?—No, I believe not.

6092. Does it not appear to you that 7½ per cent. on such articles is a very heavy duty?—Yes; but I have always looked upon it that it is a duty put on for purposes of revenue.

6093. If the duty were decreased by one-half, would it increase the consumption, do you think?—No doubt it would.

6094. With regard to cotton goods, you said that the lower orders of India used mostly the cotton goods manufactured in India?—Yes.

6095. Do they not wear very much longer, generally speaking, than the goods imported from this country?—Yes.

6096. What is that owing to?—Generally speaking they are much thicker and stouter, to begin with; they are made of heavier yarns, as the technical phrase is.

6097. But weight for weight they wear better, do they not?—Yes.

6098. Is there any other reason than that which you have mentioned; is not the weight sometimes made up artificially in the goods from Manchester?—Yes.

6099. A good deal of filling which does not appear in the Indian goods?—Yes, the Indian goods, in fact, have only that quantity of filling which is necessary to enable them to be woven; you cannot weave cotton goods without having a certain amount of what they call size in them to enable the weaving process to be carried out.

6100. That goes out in the first washing?—Yes; but in Manchester they are not satisfied with that, but put in a great deal more than is sufficient in many instances to weight the goods.

6101. Did

6101. Did not that system of filling the goods three or four years ago lead to a great deal of loss in rotting and mildew?—Yes.

6102. Is the Dacca manufacture of muslins kept up?—To a very much less extent than formerly.

6103. The natives of the very highest classes use them?—Yes, they are still worn; the finest muslins mostly by women, I think.

6104. Mr. *Birley*.] Are the native-made goods sold by weight, do you know, or by the yard?—By the yard, but weight of course is an element in the price.

6105. Do you know whether in buying Manchester goods, weight is not made a very important element in the price?—Not by the consumer.

6106. By the purchaser?—When you say that they are bought by weight, a certain quality of goods is known to weigh a certain weight.

6107. And required to weigh a certain weight, that is to say, if two pieces of goods of equal quality of yarn, and of equal manufacture were presented to a purchaser, and one was found to weigh the regulated weight, and the other not so, the heavier piece would command the higher price?—Of course the purchaser would naturally conclude that the heavier piece was the best piece of the two; he would consider that there was more cotton in it.

6108. What I want to come to is this, that the merchant who buys is as much in fault as the manufacturer for the injurious filling of this cloth made in Manchester?—The purchaser would certainly not pay the same price for the

cloth, if he knew that there was an unnecessary quantity of filling in it. Mr. Bullen.

6109. And, therefore, the honest manufacturer could not compete with the unscrupulous one?—I do not quite follow the drift of the question. 6 June 1871.

6110. The honest manufacturer could not get an equivalent price for his goods from a merchant as compared with the unscrupulous one?—You are putting the case now, as I understand, of one manufacturer who puts in an undue quantity of size, and another who puts in only the necessary quantity.

6111. Yes; and I ask whether it is not the case that the one would be able to make a living, while the other would not?—I do not think that it is so.

6112. Will you tell me whether you consider that the duties upon English goods imported into India very materially and inconveniently interfere with the commerce between the two countries?—On cotton goods, do you mean?

6113. Cotton goods principally, but copper and other goods also; the general consumption?—No doubt they do; but as I have said before, I have always looked upon those duties as necessary revenue duties put on by the Government of India.

6114. As necessary evils, in other words?—Yes, quite so.

6115. Do you consider that they also very materially interfere with the comfort and progress of the natives of India?—Yes; no doubt they do.

Friday, 9th June 1871.

MEMBERS PRESENT:

Mr. Ayrton.
Sir Thomas Bazley.
Mr. Beach.
Mr. Birlev.
Mr. Candlish.
Mr. Cave.
Mr. Crawford.
Mr. Charles Dalrymple.
Mr. Grant Duff.
Mr. Eastwick.

Sir James Elphinstone.
Mr. Fawcett.
Mr. Robert Fowler.
Mr. Haviland-Burke.
Sir Wilfrid Lawson.
Mr. Lyttelton.
Sir Stafford Northcote.
Mr. J. B. Smith.
Sir Charles Wingfield.
Sir D. Wedderburn.

THE RIGHT HONOURABLE ACTON SMEE AYRTON, IN THE CHAIR.

Mr. EDWARD FRANCIS HARRISON, called in; and Examined.

Mr.
Harrison.
9 June 1871.

6116. *Chairman.*] WHAT office do you hold in India?—The office of Comptroller General to the Government of India.

6117. Will you be good enough to give the Committee an explanation of the items which appear as part of the revenue of the Government of India, and first, respecting the receipt which appears in the accounts for 1869–70 of 157,214*l.* in respect of the mint?—That is composed mainly of the seigniorage duty on the coinage of silver; a duty is imposed at the rate of 2 per cent. on all silver brought to the mint for coinage; a further charge is made of 1-10th per cent. for the expense of the preliminary melting; the silver is always melted when tendered at the mint before acceptance.

6118. In order that it may be assayed, I suppose?—Yes, in order that it may be assayed; that it may be reduced to a homogeneous form and made fit for assaying.

6119. Is there also a seigniorage on the gold coinage?—The gold coinage is unimportant; the seigniorage on it is 1 per cent., and a similar charge is made for what is called the pre-melting of gold, which is 1-4th per 1,000, the fourth part of what is levied on silver.

6120. Do you derive any seigniorage or profit on the coinage of copper?—On copper there is a considerable profit arising from the difference between the cost of manufacture and the nominal value of the copper as coined.

6121. How many mints are there in operation now in India?—There are at present but two mints, at Calcutta and Bombay; the third mint at Madras has very lately been closed.

6122. Is that altogether abolished, or are its operations merely suspended?—It is altogether abolished; it is not entirely wound up, I believe.

6123. The establishment is discontinued, but is it intended to discontinue the mintage altogether?—Yes.

6124. Can you state the items of receipt from the Calcutta Mint for 1869–70?—There was a duty of 641*l.* realised by seigniorage on the coinage of gold, and 62,230*l.* on the coinage of

silver, and again on coinage operations of 9,528*l.*, and miscellaneous receipts amounting to 2,867*l.*

6125. Mr *J. B. Smith.*] What are the gold pieces that you coin?—The gold pieces are five rupees, 10 rupees, and 15 rupees; these are all coins the issue of which was authorised by an Act passed in 1835, but the 15-rupee coin is the only one that has been coined until within the last 12 months.

6126. *Chairman.*] To use a contradiction in language, it is a gold rupee?—The 15-rupee piece is sometimes called a gold rupee, being of the same weight as the rupee, and of the same standard, being also the same as the English gold standard.

6127. Will you state what income was derived from the Bombay Mint in the same year?—From the Bombay Mint, I find there was nothing received as duty on gold, and 75,710*l.* was received for the seigniorage duty on silver; the gain on coinage was 3,133*l.*, and the miscellaneous receipts there amounted to 698*l.*

6128. Including the sale of stores?—Yes.

6129. Is there also a small receipt for closing the Madras Mint?—Yes, merely winding-up, the sale of stores amounting in the whole to 2,407*l.*

6130. Do you know whether the Government of India anticipate any improvement or increase rather in the gold coinage, or is it their opinion that the gold coinage of India will not assume any important dimensions?—I think it is expected that under the present conditions, gold may be imported and coined to a considerable extent.

6131. Would that tend to displace the silver coinage to an equal amount, do you suppose, or would it be in the nature of an addition to the silver coinage?—I think it would be in addition.

6132. And you would not anticipate any decrease of the revenue derived from the coinage, by reason of the substitution of the gold for silver coinage?—No, I think not.

6133. Mr. *J. B. Smith.*] Do you know what proportion

proportion in the weight the gold bears to the silver?—15 to 1.

6134. In France you are aware that it is 15½ to 1?—Yes.

6135. *Chairman.*] I observe that the charges in the accounts in respect of the mint, stated as charges of collection, are 88,049 l. Are those the whole charges of the establishment of the two mints?—Those are the charges for the establishment of the mints and operative losses.

6136. Do they include also the expense of the buildings of the mints?—No, that is not included.

6137. It is limited to the fixed establishment?—The fixed establishment, and the outgoings of the year, the labour, and the operative losses.

6138. The loss in the process of melting, making the coinage, you mean?—Yes, the waste of metal.

6139. Is that a fixed allowance, or the result of actual loss?—It is the actual loss found to occur.

6140. *Sir C. Wingfield.*] At what rate is the sovereign received now in the Government Treasury?—It is received at the rate of Rs. 10. 4.; that is to say, 10½ rupees.

6141. I think the rate has been revised; it was some years ago received at a less rate, was it not?—It was. It was received at 10 rupees, and a very large number were received at 10 rupees, in the years 1863-64, if my recollection serves me right.

6142. Why has the rate been raised?—It was found that no gold after a time was brought at that rate into the Treasury, and it was not a sufficient inducement.

6143. I think at one time it was fixed at Rs. 10. 2., was it not, temporarily?—No, never to my recollection.

6144. The Government will take sovereigns at that rate which you have mentioned, but it is optional to anyone to receive sovereigns in payment?—Quite so.

6145. It is purely permissive?—Purely permissive.

6146. Do you know what number of sovereigns have been received annually for the last year, say, at this rate of Rs. 10. 4.?—A very trifling number indeed; none, in fact.

6147. Do they take gold bullion at the same rate?—Gold bullion is received by the Currency Department.

6148. It is not received at the district Treasury?—No, it is received at the mint for coinage only.

6149. *Chairman.*] At the same rate as you receive sovereigns at?—It is received, subject to a mintage charge for conversion into 10 and 15 rupee pieces.

6150. Then there would be a difference in paying sovereigns, and in paying bullion into the Government Mint or Treasury?—Certainly.

6151. If you paid sovereigns into the Treasury you would get one rate, and if you paid bullion of the same standard of pureness into the mint you would get another rate?—Yes; but the Treasury only receives sovereigns in payment of dues to the Government.

6152. Do you receive sovereigns for the purpose of re-coinage?—No.

6153. You would only receive gold bullion for that purpose?—Only bullion. Sovereigns would be received as bullion certainly, but there is no inducement to bring them to the mint.

6154. At what rate then would you receive 0.59.

bullion, as compared with sovereigns expressed in silver money?—I cannot express it in silver money, it is merely received to be returned in the form of gold coin.

6155. Of the same weight and fineness?—Of the same weight and fineness, that is, containing the same amount of fine gold, deducting a mint charge of 1 per cent., and that small fractional charge for assay which I mentioned.

6156. *Sir C. Wingfield.*] The sovereigns are received at Rs. 10. 4. at the district treasuries everywhere?—That is to say, there is authority to receive them, none were received as a matter of fact.

6157. Is there any difference between the Australian and English sovereign?—No distinction in that respect is made in the Government regulations.

6158. But which has the highest assay value?—They are precisely the same, except so far as the Australian sovereign is understood to contain a certain amount of silver.

6159. But in the bazaars of the natives themselves, the Australian sovereign does not sell so high as the English?—No, about one anna less.

6160. *Chairman.*] Do you pay in cash for the gold or silver received at the mint or in bills?—The Mint issues a certificate on the presentation of which at the Government Treasury, the gold certificates are paid in gold, and the silver certificates in silver coin.

6161. Immediately?—Yes; as a matter of practice. The Government reserves to itself the right of making these certificates payable a certain number of days after date, to admit of the coinage.

6162. How many days is that?—Twenty days used to be customary. Since 1861 the practice has been to pay all at sight.

6163. And to issue them at sight?—And to issue them at sight so soon as the assay is completed.

6164. *Sir C. Wingfield.*] What measure is necessary, in your opinion, to make gold circulate more freely among the people of India?—Assuming that it is a desirable thing that it should be made to circulate, you mean?

6165. Yes, because many think it is?—There can be no difficulty in so rating it as that it shall take the place of silver, I imagine.

6166. Merely raising the rate at which it is taken?—Quite so.

6167. But is it not the case that the natives are suspicious of all gold coinage in which there is alloy, and the purer the gold the better they like it?—Yes.

6168. And that is why some of these native gold mohars are so readily saleable?—Yes.

6169. They use English sovereigns a good deal to melt down for making jewellery, and such things, do they not, and then they extract the alloy when they do this?—That may be done; I doubt whether that is the source from which gold of high standard is derived mainly; the gold employed for that purpose, I imagine, is mainly the China gold.

6170. Do you think that the natives of India would prefer a gold coinage to paper currency?—No, I think not.

6171. *Sir S. Northcote.*] I am not quite sure that I understand you rightly. Supposing that a man brings 1,000 ounces of gold, he receives a Mint certificate for what amount?—For the amount that 1,000 ounces will produce in 15-rupee pieces.

O O 4 .

6172. Can

Mr.
Harrison.

9 June 1871.

Mr. Harrison. 6172. Can you say what that would be?—It is a matter of very ready calculation. The standard is the same as the English standard; the piece in which it is coined weighs 180 grains, and the ounce is 480 grains. It would be 480,000 by 180. It is a mere matter of calculation.

6173. *Chairman.*] You give a certificate for the equivalent, deducting the 1 per cent. and a fraction for the assay?—Yes.

6174. *Sir S. Northcote.*] Then you can tell us, in comparison, what the same amount of gold would fetch in the market?—I am not sure of the standard that is involved. The quotation of gold is, 16½ rupees, of sicca weight, which is the weight of the mohur.

6175. Perhaps you could put in a little statement afterwards when you have had time to consider it, just showing what a man would get for 1,000 ounces delivered to the mint, and for 1,000 ounces sold in the market?—That I can readily do.—(See Appendix.)

6176. With regard to the question of paper currency, have you reason to think that that is becoming more popular?—Certainly it is.

6177. Has much economy been effected by the suppression of the Madras Mint?—For the last two years the importation of bullion into India has been so small that the operations of all the three mints have, I believe, involved a loss or charge upon the Government, and the whole expense of the Madras Mint has been saved.

6178. Do you think that the same process might be carried further, and that one mint might be substituted for two?—Not as yet.

6179. Why not?—Because I think that we have no sufficient reason as yet to conclude that the importation of bullion will not return to its ordinary rate. For 13 years, from 1854 to 1866, an average amount of nearly three and a half millions sterling of silver was received at the Calcutta Mint.

6180. *Chairman.*] And how much at Bombay?—I have not the figures for Bombay, but the importations for the last two years and the operations of the mint for the last two years have been on a very small scale.

6181. *Sir S. Northcote.*] But supposing that the quantity of coinage should not increase again, do you think that one mint would supply what is now demanded?—Amplly.

6182. *Mr. Crawford.*] Do you mean one mint for all India?—One mint would be sufficient at the rate of operations at present.

6183. The one mint would not have done when you had such a large quantity of silver imported as in the years 1863, 1864, and 1865?—No, certainly not.

6184. *Mr. J. B. Smith.*] Will you turn to the imports of silver into India, and tell us when they first began to assume a large amount; was it not during the cotton famine?—Speaking from recollection, it began in 1854; it was before the famine, I think.

6185. But it was in 1860, was it not, that they became large?—They were very large then.

6186. From 1860 and during the following eight or nine years they were very large?—Very large.

6187. And in calculating what the requirements of the mint may be in future times, would it be fair to take the average of those years in which there was such a large import?—Certainly not.

6188. From what time do you think it would be fair to calculate it?—I think that the operations of the last 30 years form the safest ground of calculation.

6189. Before 1860, were not the principal imports of silver owing to the capital required for making railways?—That is my opinion.

6190. Then the great reason why the import of silver became so great after that period, was the cotton famine?—Yes; that was the principal cause.

6191. Then the import of silver was for the purpose of railways and for paying for cotton?—Yes.

6192. Do you happen to know at that time what the exchange rose to?—The rise dates from 1849 when the extreme point of depression was reached, the lowest rate was, I think, 1 s. 9½ d. or 1 s. 9¾ d.

6193. Did it not rise during the cotton famine as high as 2 s. 1 d.?—Yes, it did.

6194. What has it fallen to now?—Now it is about 1 s. 10½ d.

6195. Have you coined much gold?—A very small amount of gold in 1869–70.

6196. Do you know the amount?—I can only judge from the figures which I have before me of the amount of the seigniorage, which represents 1 per cent.; the seigniorage is 641 l., which would represent a coinage of 64,000 l.

6197. Do you think it is possible to maintain a circulation of gold at the present rate of exchange, you giving only Rs. 10. 4. for a sovereign?—No.

6198. Is it not the fact that, owing to the difficulty of obtaining silver, sovereigns were at one time paid into the Government Exchequer at 10 rupees each?—Yes.

6199. But no sooner did the exchange turn, than those coins all found their way out again?—Naturally.

6200. Then it is a farce to suppose that you could issue a gold circulation in India at Rs. 10. 4., when a sovereign is worth 1 s. more than that?—Certainly; at the present time it is 1 s. more as near as possible.

6201. *Mr. Candlish.*] What do you do with the sovereigns which you receive in India; do you re-circulate them?—The number received has been extremely small.

6202. What do you make of them?—Those that have been received have been re-issued at the rate at which they have been received.

6203. *Mr. J. B. Smith.*] What alloy do you put in?—The same as the English standard, one-twelfth.

6204. And is that alloy, copper?—Yes, copper.

6205. *Mr. Candlish.*] Is a uniform English and Indian currency a possibility?—It is possible, no doubt.

6206. Would the English currency be adopted in India without trouble and inconvenience?—I should think it would involve an extreme amount of trouble and inconvenience.

6207. So much as to render a uniform currency practically impossible?—It would involve in the first instance, a change in the standard of value from silver to gold; a change that can hardly be carried out without great difficulty.

6208. But would it not be an immense advantage if ultimately carried out?—No, I think not.

6209. What is the reason why the rupee is not taken by the Government official at the Suez Post

Post Office at the same value as in Bombay?—The Suez Post Office is under the administration of the Postmaster General, and the rupee is received in Suez at something approaching to its intrinsic value in England.

6210. What I mean is this, are the rupees received in Suez sent back to India?—I am not aware.

6211. You are aware that they only take them at 1 s. 10 d. there?—Yes.

6212. To the great detriment of Englishmen coming home?—To the loss of Englishmen coming home.

6213. Would the concentration of the work of coinage in one mint increase the expenses of that one mint over what they are now; for instance, would the Calcutta Mint be conducted at pretty nearly the same establishment charges, if it did all the work?—No, the establishment charges vary in proportion to the amount of work done.

6214. The concentration in one mint, however, would lessen the total charge, would it not; in regard to superintendence, for instance?—Superintendence would remain the same.

6215. And the value of the building would remain the same?—Yes.

6216. Mr. J. B. Smith.] I see that the charges for the mint in 1870–71 were 68,114 l., whilst the receipts from the mint were only 50,000 l.; do you expect that the receipts of the mint in future will be sufficient to pay its expenses?—I think we have no sufficient data to form an opinion at present. There are certainly reasons for the belief that the importation of silver for the future will not be so large as it has been in the past. In the place of remittance of large amounts of English capital to India for investment in railway enterprise and other undertakings we have on the other hand, a remittance from India to England of the growing profits of these railways, and that will tend, I apprehend, to a permanent lowering of the rate of exchange between England and India.

6217. And is there not another reason why you may expect a lower rate of exchange, namely, the great falling off of the value of the exports?—I am not aware that that has been established.

6218. During the cotton famine, the exports of cotton amounted to 30,000,000 l., and probably this year they will not amount to more than half that sum; will not that make any difference?—Certainly, if there is a permanent falling off in the value of the exports of India, that would be a consequence; but I am not aware that we should look forward to a permanent falling off.

6219. What do you expect would supply the place of that great deficiency in cotton?—That I should expect to be met by the ordinary growth of other exports, especially the export of other fibres.

6220. Mr. Eastwick.] You do not think that it would be advisable to do away with the mint at Bombay, do you, because, supposing that by so doing you could save money in some respects, at all events there would be the expense of sending round the coin from Calcutta to Bombay?—I certainly should not think it advisable at present to do away with the mint at Bombay.

6221. Are there any of the old Venetian sequins in the market at Calcutta now?—I think there must be a few; when I was leaving Calcutta, three months ago, a few were brought to me on my inquiring for French gold coins.

0.59.

6222. They are taken very readily by the natives, are they not?—I am not aware.

6223. They are much finer gold than ours, are they not?—They are; I am not aware of the standard.

6224. If we had a finer standard, would not the gold be taken more readily by the natives; do they not, for instance, buy these sequins in order to make them up into ornaments, whereas they would not buy a sovereign?—The sovereign is not appreciated for that purpose.

6225. You think that the natives would take the gold if it were of a finer standard more readily than they do now?—Yes.

6226. But then, in that case, our gold coinage in India could not correspond with our gold coinage in England, could it?—No.

6227. Therefore we have that difficulty; we wish to make it acceptable to the natives, and we cannot do that if we keep to our present standard; and if we make it acceptable to the natives, then we cannot make it exchange with our coin in England?—That is so.

6228. Is it not the fact that we, last year, sent about 600,000 l. worth of rupees to England?—That was so.

6229. Which were all recoined at considerable loss?—The whole was not in the form of rupees, it was as silver bullion.

6230. But when we have sent rupees in that way, they have been recoined at a loss?—I am not aware of that.

6231. Mr. Crawford.] I think the silver to which the honourable Member has referred, came to the Bank of England here, and was sold by the Bank of England for the account of the Home Government?—It was so.

6232. Do you recollect the exchange which the whole of the consignment gave?—It was about 1 s. 10½ d., but I am unable to state precisely.

6233. And the Home India Government were drawing in India at the rate of exchange worse than the 1 s. 10½ d., which that remittance of silver gave?—I think not; I think the lowest rate was 1 s. 10½ d.

6234. Then, in point of fact, there was no loss whatever in the transaction, so far as the Government were concerned?—No loss.

6235. If that money was wanted here, and was brought home at 1 s. 10½ d., if the Government had not had that money, they would have had to draw here at a worse exchange?—Yes.

6236. Therefore it was an advantage to the Government having ordered that money to come home?—It was no doubt advantageous.

6237. I think that consignment of silver consisted of a great variety of coins, the standard rupee, the syce silver, and some very old rupees of former coinage, forming part of the consignment of Furruckabad rupees?—I was not aware of that; merely, I presume, mixed with the rupees sent from Bombay. The amount sent from Calcutta consisted mainly of silver bars of a high standard, and from Bombay the remittance was made in rupees.

6238. Did not the silver bars of high standard contain a good deal of gold?—They did.

6239. Have you no refinery in Calcutta by which you can extract the gold, as they do here?—The process is not practised in the Calcutta Mint; I think there is no such refinery at present there. Many years ago, the practice was carried on by Doctor, afterwards Sir William O'Shaughnessy, but it was not thought to an-

swer;

Mr.
Harrison.

9 June 1871.

Mr.
Harrison.
9 June 1871.

swer; that was for the extraction of gold from China silver.

6240. Are you aware of the fact that it is worth the while of the importer of silver here to extract the gold if there is more than five grains of gold to every pound of silver?—Four grains, I have understood. It is taken at a calculation in the value if it exceeds four grains.

6241. I think you do not propose that there should be only one mint for all India, do you?—By no means.

6242. In fact, the mercantile transactions of Bombay are so large as to give them very nearly an equal claim to a mint of their own, as Calcutta would have?—Quite.

6243. Great practical inconvenience would arise from having to send the precious metals, gold and silver, either from Calcutta to Bombay, or from Bombay to Calcutta?—It would be very inconvenient.

6244. Have you any views as to the advantage of a double standard in India, that is to say, having a legal double standard by which debts could be discharged, either in the one or in the other currency?—I think that if gold were somewhat under-rated, no practical inconvenience would follow from a double legal standard.

6245. Is it not the fact that in all countries where a double standard has existed practically, one only has prevailed; in the case of France for instance?—It is the case with France.

6246. There silver was for a great number of years the only currency one met with, but subsequently that silver has been displaced by gold, which is the principal circulating legal medium for large sums?—That is so; that is a process which this country has also gone through, and the United States.

6247. Do you think it would be possible to maintain a double standard under those circumstances in India, however nicely you might adjust the relative proportions?—Not to maintain it.

6248. The greater part of the gold that remains in India as bullion, passes into private use, does it not?—It does.

6249. And it is used for purposes of hoarding to a large extent?—It is difficult to trace where it goes to, no doubt much is used for hoarding.

6250. That is one of those mysteries which we have not been able yet to get to the bottom of in India; what becomes of the large amount of precious metals that gradually disappear?—It is very difficult to trace them.

6251. Have you seen any of those small ingots of gold sent from this country to India nearly pure, 99½ per cent. pure?—No, I have not seen them.

6252. Mr. Fawcett.] Would there not be a great convenience in having a double standard in India, on the same principle as we have a double standard in England?—There is not a double standard in England.

6253. But I mean on the same principle, so as to make payments legal in gold beyond a certain amount, in the same way as payments are legal in England in silver up to a certain point; simply to encourage the use of a gold coinage?—I cannot think that it would be convenient.

6254. You probably remember a very able Minute issued some years ago by Sir William Mansfield, the present Lord Sandhurst, in reference to the introduction of a gold coinage; he attributed very great advantages to it, did he not?—Yes, he did.

6255. You do not agree, then, with the advantages which he attributed to it?—No.

6256. Could you state generally why you do not?—It is with the greatest diffidence that I express dissent from the reasoning contained in any part of Lord Sandhurst's able and exhaustive paper; there does however appear to me to be a fundamental error in the view taken in that paper of the functions of the precious metals in relation to money, owing to which error an under-estimate was formed of the difficulties attending the course proposed, and an over-estimate of the advantage of a change from a silver to a gold currency. It is laid down in the paper referred to that currency is only "the means of transacting business," "the medium of domestic exchange," and that therefore in the different stages of a community in its advances towards wealth, a change may be made in the currency-medium from copper to silver, and from silver to gold. The most important function performed by the metal used as a currency medium, namely, that it forms the standard or measure of all money value is expressly excluded from consideration as involving a fallacy, and yet that such a material basis is essentially necessary for the maintenance of a standard of value, however true it may be that value exists independently of any particular metal is evidenced by the experience of every nation which has attempted to maintain a standard of value with an inconvertible paper currency. The only conception which I can form of a rupee is, that of a certain weight of silver of a definite standard, and of all contracts expressed in rupees, as of engagements involving the payment of specific quantities of that metal; if this fundamental conception be correct, a contract to pay a certain number of rupees annually in perpetuity would be materially varied if the obligant were allowed on silver rising above a certain price to substitute a specific quantity of gold of less value as measured by silver. I do not say that there is any difficulty in conceiving of, or necessarily any injustice connected with the adoption of a double or alternative standard, but that in advocating a change from a silver to such a double standard of silver and gold, or from a silver standard to one of gold, the effect upon existing contracts must be kept clearly in view, and that it must be remembered that in India, owing to the perpetual settlement of the land revenue of the greater part of Bengal, and of portions of the land revenue of the North Western Provinces, and of the Madras Presidency the Government is interested as a creditor on an amount exceeding 4,000,000 £ sterling annually. The illustrations put with so much power in Lord Sandhurst's minute derive much of their weight from the exceptional circumstances of a peculiar period, when an enormous amount of silver was suddenly required to be paid to India for cotton grown under the pressure of an extraordinary demand for Indian cotton. That the qualifications of silver for the purposes of a measure of value were severely tested at that time is doubtless true; the inconveniences attending the employment of a different standard in India from that of England were then, too, brought prominently into notice. It seems however, doubtful whether, after all, apart from any question of the effect of a change of standard on existing contracts silver as the standard metal is not better suited to the circumstances of the people of India than gold. It is certainly true that even in the immediate neighbourhood of Calcutta, large numbers of the labouring classes rarely see a silver

silver coin, their transactions being so far as coin is used settled almost entirely with copper. A gold coin representing ten or even five rupees would be altogether beyond their reach. It may be said that with a gold standard the rupee would still exist, but if the rupee were to be made, a token coin of less intrinsic worth than its nominal value as a submultiple of the standard gold coin, and it is only on this condition that it could be maintained in circulation, it would I conceive be thoroughly unpopular. The people, to quote Lord Sandhurst's words, "hug the idea of intrinsic value in coins."

6257. You have given your attention a great deal to the subject, I presume, judging from some of your previous answers?—I have certainly considered the subject, but not from the point of view of giving a responsible opinion.

6258. Can you give any estimate of the addition that has been made to the coinage of India during the last few years?—The figures are readily available.

6259. But the thing is not quite clear from the figures; you do not at all arrive at what the addition has been in coin to the country by simply considering the amount that has been coined at the Mint, because a portion of the amount coined there may be old coin re-coined, and a portion of that which is coined there may be exported; what I want to know is, whether you can give any idea of the addition that has been made to the circulating medium in India?—No; the only deduction that I think should be made from the coinage of the Mint is that amount which is coined from silver tendered at the Mint by Government officers, and that is probably ascertainable; that will not be a very large deduction.

6260. *Chairman.*] You cannot ascertain from the exports what has been exported in the form of current coin and what in the form of bullion; are there means of ascertaining that?—Yes; our returns will show the amount of treasure or specie exported (but I hardly think that will be satisfactory) from Calcutta to Akyah, and Rangoon; but that will give us very little idea of the amount which passes beyond our frontier.

6261. On the land frontier there is no account taken of what passes?—On the land frontier there is no account taken; and I have no doubt that at times a large amount of silver passes out of British territory in the neighbourhood of the port of Akyah and at other points.

6262. Is there any account of the exports in the current rupee form, and other exports in the form of bullion?—Yes; I think the returns will show that distinction between treasure and bullion.

6263. *Mr. Fawcett.*] Has there not been a very great export of bullion and specie into China from India?—Not that I am aware of.

6264. Probably the best evidence that you can get that there has been a very large addition to the circulating medium in India depends upon the circumstance of the great increase of prices that has taken place; that would show it, would it not?—No doubt.

6265. You having been interested in these monetary questions, have you ever formed any estimate of what the depreciation in the value of silver has been?—It is very great, as estimated by the price of the principal grain of Bengal; I apprehend that it must be 50 per cent.

6266. In what period?—In 25 years.

6267. And from the answer which you have
0.59.

just given, I presume that you agree with this view, that perhaps the best way of estimating a general depreciation in the value of the circulating medium is to estimate it by considering the rise in the price of an article of general consumption?—I think so.

6268. *Mr. Crawford.*] Have you any idea of the amount of silver in circulation throughout India; has any estimate been formed of that?—No; I can give no opinion on that.

6269. There is no gold in circulation we know, as a coin?—There is no gold in circulation.

6270. But if there were a double standard, proceeding upon the analogy of a double standard in other countries where one has always excluded the other in course of time, it would be a very difficult thing for gold which is not in use now in India as currency, to displace the enormous amount of silver in circulation, would it not?—Yes.

6271. And the transactions in India are on so small a scale amongst the lower orders that gold would be practically useless for the purpose of making daily payments?—Yes.

6272. Silver, therefore, would be absolutely required for that purpose, and to a much greater extent than is the case in this country?—Yes.

6273. India may be said to be supplied with the precious metals as regards silver from Europe and China?—Yes.

6274. And with gold principally from Australia?—From Australia; and from China in the form of leaf gold.

6275. But practically there never has been within your recollection any export of the precious metals from India to China?—Never, that I am aware of.

6276. That is to say the value of the opium exported from India has been so largely in excess of the demand for the transmission of goods from China to India?—That is so.

6277. *Mr. Fawcett.*] Although there has been no export of specie from India to China to adjust the trade between India and China, there has been continually a balance due from England to China which has been paid in money, and which money has been transmitted through India to China, and this money represents a portion of the specie which has been apparently exported from England to India; is not that the case?—That is so, no doubt; the payment being made in Indian opium.

6278. But in some years, judging from figures that I have seen, it has amounted to as much as 8,000,000 *l.*; is not that the case?—I am not aware of the exact amount.

6279. When the figures appear to show that there has been an export (I believe this was the case in 1856) of something like 14,000,000 *l.* of specie from England to India, considerably more than half of that, I believe, was not merely specie or bullion sent from England to India, but was simply specie transmitted to India in order to be sent on to China, do you know whether that was the case or not?—I am not aware that it was further transmitted from India to China.

6280. *Mr. Crawford.*] Are you aware that there is a large trade between America and China?—I am not aware of the particulars of the trade.

6281. And that the supply of money for the purposes of the American trade in China, is adjusted through the Indian exchange to a considerable extent?—I can easily understand that that is so.

6282. *Mr. J. B. Smith.*] I think you stated
it

Mr.
Harrison.
9 June 1871.

Mr.
Harrison.

9 June 1871.

it as your opinion that the depreciation in silver, measured by the price of grain, was about 50 per cent.?—Yes.

6283. Is there any reason to think that the price of food will remain as it is, or will it have a tendency to decline?—I have no reason to think that it will decline.

6284. Have there been any causes in operation, which have raised the price of grain, as for instance, the substitution of the growth of other articles, such as cotton and jute?—That will cause a local rise in the price of grain, no doubt, but hardly in the grain in those districts which are especially grain-producing provinces.

6285. May it not arise in another way, namely, that a large portion of the labour has been abstracted from the growth of grain to employment in railways and those works?—I should not think that that was the fact. The amount of labour employed in works of that kind must be very small compared with the population.

6286. You do not anticipate any decline in the prices of grain?—No; I should not.

6287. Mr. Crawford.] We have it in evidence from a previous witness, that the wages of labour have very much increased in Bengal; have salaries, I do not mean of European officers, but of the employes in counting-houses and in the Government establishments, increased during the last 10 or 15 years?—There has been a tendency that way.

6288. Where you could formerly get a writer at 100 rupees a month, should you have to pay more than that now?—You cannot get one of the same qualifications at the same salary; there is a tendency to a higher rate of remuneration.

6289. European servants have not come in for a share of that rise, have they?—Yes; they have.

6290. Chairman.] I suppose if there were a permanent diminution of the imports of silver, there is nothing in the establishments of the mints to prevent their being permanently reduced also, so as to diminish the charges for them?—The expense of the establishment cannot, I apprehend, be reduced below a certain amount. At the present time the establishments are maintained on as low a scale as is considered compatible with the maintenance of efficiency.

6291. Will you be good enough to turn now to the item of receipts, which is described in the account as "Marine," and which for 1869-70 is 329,953 l.; what is that item composed of?—The most important item in the marine receipts, consists in the pilotage dues for the Hooghly.

6292. What was the amount of that item in that year?—£. 70,850.

6293. Does that represent the ordinary receipt for pilotage from year to year?—Yes.

6294. Is that all revenue, or is it for the most part applied in payment of the pilots' salaries and expenses?—Out of that 60 per cent., which would be equal to about 42,500 l. is paid directly to the pilots employed, leaving a balance of 28,000 l.

6295. However that would appear in the head of expenditure on the other side of the account; it would not be included in the charges of collection?—It will be included under the head of Marine on the other side of the account.

6296. Does the sum which you have mentioned include also the floating establishment?—The sum which I have mentioned is retained by the Government to cover the expense of the maintenance of the pilot brigs and fixed establishments at the mouth of the Hooghly.

6297. What are the other items constituting the total receipt?—There is a sum of 5,600 l. for fees levied by the shipping masters at the ports of Calcutta and Bombay principally; and there is a receipt of 76,000 l. in Calcutta, and 30,000 l. in Bombay from dockyard services and supplies.

6298. What is that item?—In Calcutta it consists mainly of the value of services rendered by the dockyard to the Calcutta Port Fund or Port Trust, the account of which is not included in the revenue accounts of the Government of India.

6299. That is a local or municipal body?—It is a local trust.

6300. Then what services are they that the Government renders at Bombay for which this 30,000 l. is received?—It is, I believe, largely for services rendered; sums received for the use of the Government docks from private individuals.

6301. Is there any other principal item that you have to mention?—There are other items considerable in the aggregate in the accounts for 1869-70, but which separately do not appear to require notice.

6302. Was there not a large sum received in that year for the sale of vessels?—There is a large sum in the accounts received at Bombay for the sale of vessels, but that of course is a casual item.

6303. What were those vessels employed in for some special service, or why were they all sold?—That amount is for the sale of stores as well as of vessels, and the information is not immediately available.

6304. That is not a continual item, but it may be considered as an accidental item?—Yes.

6305. The two items that you have given just now are for services performed from year to year?—Yes; receipts of a more regular character.

6306. Are there not some miscellaneous receipts for special pilotage?—There are some miscellaneous receipts, but not very large either individually or in the aggregate.

6307. So that deducting the special item of 124,000 l. which you have mentioned as received from the sale of ships and stores, the permanent source of revenue under that head of "Marine" would be about 200,000 l., or a little more?—Yes; the amount which it is estimated will be received during the current year 1871-72 is 237,900 l.

6308. Then you will observe that in the printed account, there is a deduction made under the head of "allowances, refunds and drawbacks," 26,592 l.; what does that mean in relation to this item can you explain it?—I am unable to explain that.

6309. Mr. Fawcett.] You say that you obtain 70,000 l. from the pilotage dues of the Hooghly, and the Government pays 42,000 l. in salaries to the pilots; therefore that represents a tax of 28,000 l. on shipping, does it not?—The 42,000 l. is not paid in salaries, but the pilots, who are not salaried, receive that amount, being 60 per cent. of the charge for pilotage as their remuneration; they receive a per-centage.

6310. Then does this amount which is levied from shipowners represent a charge for anything else besides pilotage; is any money spent by the Government, for instance, in keeping up the navigation of the Hooghly?—There is a considerable amount expended; but I do not think that this is to be considered as a set-off against that expense; this is mainly required for the maintenance of four pilot vessels at the mouth of

the river, and for the establishment maintained in these vessels, and for the lights maintained at the mouth of the Hooghly.

6311. They, I suppose we are to understand that this 70,000 *l.* does not represent revenue at all, but is simply money disbursed by the Government in maintaining the pilots, and in maintaining these lights and pilot ships?—It is not revenue in the sense of taxation.

6312. But, in fact, it ought not to appear at all as revenue; it is simply a matter of account; money received by the Government and expended for a certain definite and specified purpose; it does not represent net revenue at all?—It is a payment for a service rendered in the same sense as the Post Office.

6313. But it does not represent any profit of the Government; from the English Post Office, for instance, the Government does obtain a very considerable revenue; they obtain a revenue greatly exceeding what they spend; therefore that is genuine revenue; but, as far as I understand you, they receive this 70,000 *l.* and they expend it?—I think the whole is expended.

6314. Are you certain that a great deal more is not expended?—If the expense of the maintenance of the channel lights and buoys, and the survey of the river, and the dredging of the river, and keeping open the channels, are taken into account, I have no doubt the expenses are not covered by the amount received for pilotage.

6315. Then that being the case, do not you think that we should obtain a much more correct idea of the financial position of India, if it were not put down at all as revenue; but it was said that this 70,000 *l.* which is obtained does not cover the expense which is incurred, and therefore, instead of representing revenue, represents a loss?—There can be no clearer form of statement, I presume, than a clear statement of what is received on the one hand, considered as revenue, and what is paid on the other hand.

6316. Then it is a fact that this 70,000 *l.* does not represent revenue, but simply represents something on the other hand, or is more than balanced by an expenditure on the other side; is it not?—Yes, I think it is.

6317. Now I will direct your attention for a moment, if you please, to the 30,000 *l.* which I understand you say is obtained from dock dues at Bombay, from the Government docks at Bombay?—That I believe to be the case; sums received for the use of the docks.

6318. Can you tell me what was the amount expended in the construction of those docks, and the amount expended on their annual maintenance?—I am not aware of the cost of the docks.

6319. Can you give us any estimate of the cost of maintenance?—In regard to that I can give no further information than is contained in the published accounts.

6320. I want to get side by side in your evidence, what is the cost, if you can give it?—I think it would be impossible to make a comparison from the only information that we have.

6321. Mr. Grant Duff.] You came here on the understanding that you were to be examined to-day only on the items of receipt, and not on expenditure, I believe?—Yes.

6322. And you will be perfectly prepared later, no doubt, to speak on such items of expenditure as you know something about?—Yes.

6323. Mr. Fawcett.] Then I understand that this 30,000 *l.* is simply the gross receipts obtained

from the dock dues at Bombay?—What I understand to be the case is, that these docks are not maintained for the purpose of producing a revenue, but that this 30,000 *l.* that has been received must be considered as a lessening of the charge of docks which are maintained from other considerations.

6324. You stated, I think, that an item of 124,000 *l.*, which appears in this amount, is an exceptional receipt, and arose from the sale of ships and from the sale of stores; would you express an opinion as to whether you think that ought to have been put down as income or as capital?—I think it desirable that all sums received should be shown in the same way as revenue.

6325. But these stores represent, do they not, a portion of the stores which were not required for certain public works, such as the construction of docks, and things of that kind?—They probably represent or are balanced by an equal amount of expenditure.

6326. Then they represent at least an equal amount of expenditure, do not you think; and probably they represent three times the amount of expenditure, if Government buys stores and re-sells them; did you ever know them do that without enormous loss?—I cannot say.

6327. That generally takes place; all stores, in fact, if not required must necessarily be sold at a depreciation, must they not?—I cannot say.

6328. Then you say that the sale of these stores which is put down as income simply represent at least as great an expenditure, do you not; that there must have been an equal expenditure to buy the stores as there is receipt from the sale of them?—I think it is probable that there was at least an equal expenditure.

6329. And perhaps greater?—It is possible that it may be greater.

6330. Are you aware that that expenditure was obtained by a loan?—No, I am not aware of that.

6331. But are you not aware that almost all the public works in India have been carried out by loan?—No; a very large proportion of the expenditure on the public works of India has been certainly defrayed from the current revenue.

6332. But last year, when this item appeared, was there not a very large amount borrowed for the purpose of public works; that is a matter of notoriety, is it not?—Provision was made for the execution of a large amount of public works from borrowed money, but entirely irrespective of any marine expenditure.

6333. But that is not my question; was not a very large amount obtained last year by loan for the purpose of public works; it is a matter of notoriety, is it not, that money was borrowed for that purpose?—It is a matter of notoriety that a large amount is being expended on public works, that is raised on loan.

6334. Then that being the case, it comes to this; you have not got enough money from your revenue to construct these public works, but you are obliged to borrow money; you buy stores with part of this borrowed money, and you find that these stores are not required; you sell these stores, and you put down the money which they yield actually as an ordinary receipt of income; that is what appears in the accounts, does it not?—The question, I think, can have no connection with the sum of 30,000 *l.*

6335. No; I mean the 124,000 *l.* which resulted from the sale of stores and ships?—That is in no

Mr.
Harrison.
9 June 1871.

Mr.
Harrison.
9 June 1871.

way connected with the expenditure from money raised on loan.

6336. Mr. *Grant Duff*.] All the money obtained by loans is expended on what are called public works extraordinary, is it not, which have nothing in the world to do with these particular works?—Yes, nothing at all.

6337. Mr. *Farwell*.] You are called here by the Government as a witness, and of course you are more competent than anyone else to give a detailed statement; can you give me then a detailed statement of how this 124,000 £ is obtained?—I can obtain that from India.

6338. This is a Committee for inquiring into Indian Finance, and a witness is called by the Government from the India Office; is there any one at the India Office who can explain to me how this item of revenue arises of 124,000 £?—I am not in the establishment of the India Office; my duties are entirely in India.

6339. Then you come from India, and are called as a special witness upon this particular department of revenue; the most important item in it; I want details of it, and you can give me no idea of how this 124,000 £ is obtained?—I can give no specific information at present.

6340. Mr. *Birley*.] Is the charge relating to the navigation of the Hooghly entirely collected by the Government, that is to say, for the lights, the dredging, the pilotage, and the survey?—There is a separate port trust, which has lately been put on a somewhat new footing, and which maintains all the appliances necessary in the port of Calcutta for the movement of ships; and a tonnage duty is collected by them, and part of this is expended in the maintenance of the port establishments, the dredging of the channels in the higher part of the river, the approaches to the port, and the survey of the river.

6241. And that tonnage is collected by the trust, whilst the pilotage is collected by the Government?—Yes; they are distinct.

6342. Then is there any reason why the Government should not derive a surplus or a profit from the pilotage dues?—No reason, further than that it would be a tax or charge upon a special interest.

6343. No; they would charge simply a full sum to cover their expenses; I mean merely a legitimate return?—That is what I understand to be the principle that guides the action of the Government.

6344. I understood from your answer, that you had no doubt that the costs and charges exceeded the receipts?—I stated that if we took into account the indirect expenses connected with the dredging and other expenses required for keeping communications with the sea open, the charge is probably insufficient.

6345. But I thought that those were defrayed by the trust, by the tonnage dues?—Well, the ordinary expenses of surveying and the cost of the maintenance of a special river dredge were paid by this trust; but certain special expenses that were required for extensive works on the banks for regulating the direction of the current, and so forth, have been borne by the general revenue as part of the public works expenditure; and if these special works were taken into account, I apprehend that the pilotage dues would be insufficient to cover the whole expense that has been borne by the Government.

6346. Is any charge made upon vessels belonging to the Government either for pilotage

or for tonnage?—Not for pilotage, but for the tonnage.

6347. Now, with regard to the sale of ships and stores which we have heard of, I suppose those are simply ships and stores which, having gone out of use, were not required, and were sold as a matter of ordinary economy?—That is probably the case.

6348. Mr. *Beach*.] Is the pilotage compulsory?—Not by any act of the Government, but I apprehend that any ship would vitiate her insurance by entering the Hooghly except under charge of a pilot.

6349. Sir *S. Northcote*.] With reference to some of the questions put to you by the honourable Member for Brighton, am I right in understanding that the principle upon which the Indian accounts are kept is this: that if there is any item of revenue which involves expenditure for the purpose of raising that revenue, the accounts show not the net amount of revenue received, but the gross amount of revenue on the one side and the expenditure incurred for raising the revenue on the other?—That is so.

6350. And that similarly, when there is any item of expenditure which is to some extent diminished by receipts, the accounts do not show the net amount of expenditure deducting the receipts, but show the gross expenditure on the one side, and the gross receipts on the other?—That is so.

6351. In case any person should wish for further information upon the subject of items so entered, there are means, are there not, of obtaining fuller information than the accounts in the summary disclose?—There would be no difficulty whatever in giving the fullest information in regard to any part of the account; but the whole of this information is, perhaps, not immediately available in this country.

6352. Now, with regard to the mode in which any sum of money which is set down as having resulted from the sale of old stores has been obtained, am I correct in understanding it in this way, that the money is obtained in the particular year by the sale of stores which are actually at that time in the possession of the Government?—That is the case, no doubt.

6353. Then if you wished to trace back how those stores came into the possession of the Government, you would have to go into the history of different items, some of which may have been purchased in previous years?—That is no doubt the case.

6354. As a general rule, all these stores will have been purchased, will they not, in a year in which the finances show an equilibrium, by the expenditure of revenue received from taxation or other ordinary sources of revenue?—That will be so.

6355. Now, with regard to the works which are defrayed by loan, those are works which are known as public works extraordinary, are they not?—That is so.

6356. And that is a well-defined class, which does not include such items as those of which we have now been speaking?—That is so; and it is not only a class of works, but special works; not of a special description merely, but specified works of a particular description; for instance, not all new irrigation works, but specific works of irrigation.

6357. Are you aware that considerable pains have recently been taken to confine the expenditure of money borrowed for public works extraordinary

ordinary to specified works?—I am aware that that is the case.

6358. And to exclude the expenditure upon ordinary public works of money so borrowed?—Yes.

6359. Sir C. Wingfield.] Formerly the pilotage of the Hooghly was a close service, was it not?—It was.

6360. Men were appointed to the pilot service from England?—It was so.

6361. Subsequently the service was thrown open, was it not?—That is the case at present.

6362. That is to say, any person on passing an examination will receive a certificate to act as pilot?—I believe that is the case.

6363. Is it optional with the owners of vessels, in entering the Hooghly, to employ pilots or not?—I believe it to be optional so far as the action of the Government is concerned.

6364. And there is no obligation on them, is there, if they do not employ pilots, to pay pilotage dues for the benefit of the pilotage fund?—I am not aware of the authority under which pilotage is levied. It is under no law that I am aware of, and therefore it must be optional.

6365. Are the rates of pilotage fixed by the Government?—They are.

6366. And then a pilot, if he is employed, can only demand according to those rates?—I think that the demand is made upon the vessel independently of the pilot.

6367. Chairman.] You mean that the money is received by an officer of the Government, not by the pilot?—Yes.

6368. Sir C. Wingfield.] But is the pilot bound to charge according to a schedule of rates fixed by the Government, or may he demand what he pleases?—I think that what binds the pilot to the Government rules is, that if he did not abide by them he would not have the services of the pilot brig at the mouth of the river.

6369. But does the Government undertake to fix the pilotage rates, or is that left a matter for private arrangement between pilot and captain?—It is fixed by the Government.

6370. Mr. Crawford.] With regard to a question put to you by the honourable Member for Brighton as to the account being kept of the expenditure incurred in the construction of the docks at Bombay, have you on the books of the Government of India anything in the nature of a capital account showing the cost of civil and military buildings, and docks, and ships, and other fixed property?—Nothing, at the present day.

6371. Mr. Fawcett.] You stated, in reply to the Right Honourable Baronet the Member for North Devonshire, that loans were only devoted to the construction of public works extraordinary, and you went on to state that the stores contained in this item of 124,000 £. which were sold, could not represent any stores which arose from public works extraordinary, which were constructed by loans; how could you give that positive answer, after telling me that you did not know of what items this 124,000 £. was composed?—Because they relate to a perfectly distinct branch of the Government service.

6372. Chairman.] The explanation is, that this is not an item connected with those specified works for which the public loan is raised; having therefore nothing to do with the specified works, you know that it cannot be included in those works?—

0.59.

6373. Mr. Fawcett.] But do you know that from your own personal knowledge, or from anything that appears in the accounts?—I know it from my knowledge of the principle on which the accounts are framed.

6374. For instance, would a dock be considered an extraordinary public work?—If it were, the expenditure would not appear under the head of Marine Expenditure, but under that of Public Works Expenditure.

6375. But as to the sale of any surplus stores connected with it, for instance, of any vessels which might have been bought for its construction, in carrying stone, supposing these are sold, do you know that the items of the sale of those vessels would not appear amongst the sale of marine stores?—I know that no expenditure for the construction of docks has been classed as extraordinary public works, and therefore payable from money raised on loan.

6376. Mr. Grant Duff.] It is no part of your duty, is it, to know how many old anchors, how many broken capstans, how many pieces of rope, how many unseaworthy ships, how much rusted iron, or how much damaged copper, has been sold under this particular head?—That is no part of my duty.

6377. Mr. Candlish.] You say that 124,000 £. was received in the year 1869–70 for the sale of vessels and stores not arising under ordinary circumstances; the vessels, I think, had been sold after having been procured for the Abyssinian Expedition?—I am unable to state specifically what vessels or stores this item is composed of.

6378. Then you cannot answer this question, on what account they were sold?—No.

6379. And to what credit did the proceeds pass?—It is with that that the question now deals. The proceeds are credited to the account of marine receipts or revenue in the accounts for the year 1869–70.

6380. Not to the credit of the Home Government, the British Government?—No, it has no connection with that.

6381. You do not know to what credit the proceeds ultimately went?—This amount certainly went to the marine revenue of the Government of India.

6382. Then the Government of India have appropriated this 124,000 £.?—Doubtless.

6383. You have had no knowledge as to how those vessels and stores came to be in the market, or for what they had been previously used?—I do not know that this represents the proceeds of the sale of ships further than that it is described in the accounts as the “sale proceeds of vessels and stores.”

6384. You expect ships are meant by vessels, do not you?—If I offer a conjecture, it is that a portion, probably no inconsiderable portion, of this amount represents the value of stores issued from the Bombay Docks to the transport vessels maintained for the transport service between Bombay and Suez, and to ships of Her Majesty's Navy visiting Bombay.

6385. You say that a small sum, 5,000 £., I think, was received under some shipping head; will you state by whom it was received; who pays it?—The seamen shipping at the ports of Calcutta and Bombay.

6386. It is paid by the sailors?—Yes.

6387. And 76,000 £., you have stated, was received on account of the docks at Calcutta?—Yes, that is so.

P P 4

6388. From

Mr.
Harrison.
—
9 June 1871.

Mr.
Harrison.
—
9 June 1871.

6388. From whom was that received; who pays it?—That is mainly received from the Calcutta Port Fund.

6389. What is that, as distinguished from the Government of India and the Imperial revenue?—It is an account known as the Calcutta Port Fund; the revenue or income of which is composed mainly of a tonnage due levied upon all ships entering the port, payment for services performed, and for the hire of moorings which they are almost, from the nature of the port, necessitated to employ; and these sums forming the income of the Calcutta Port Fund are expended in the construction and maintenance of all the appliances required for mooring ships and other purposes directly connected with the port.

6390. Then how do you come to put it under the designation of docks in any way?—This is described as "Dockyard Services and Supplies."

6391. Those are payments?—These are payments made to the general revenue.

6392. For services rendered to the mercantile shipping by the dockyard staff?—Yes.

6393. Then the 70,000*l.* of which you have spoken as pilotage receipt is for pilotage proper?—Yes, that is for pilotage proper.

6394. Did I rightly understand you to say that that sum was not used to pay the pilots; you mentioned 42,000*l.*, as being paid for pilotage service, did you not?—For pilotage service.

6395. Leaving the balance of 28,000*l.* for establishment charges?—For establishment charges and those expensive appliances which are required for maintaining the pilot stations at the mouth of the river.

6396. So that, in point of fact, more than one-third of the receipts goes for establishment purposes, and not for direct service rendered, not for executive service; 28,000*l.* out of the 70,000*l.*?—That is so.

6397. Is the number of pilots employed in the Hooghly limited; is there a Pilotage Board, examining and giving certificates of competency?—There is no limit that I am aware of.

6398. Then the Pilotage Board, or whoever certifies to competency, would certify anyone presenting himself for examination whom they found efficient?—That I understand to be the case.

6399. Do you feel that you are in a condition to answer the question?—Not positively.

6400. The 70,000*l.* received for the pilotage, and the 76,000*l.* received for general purposes, such as buoyage and beaconage, and such like, are all charges upon the mercantile marine visiting the Hooghly?—That is so.

6401. Is it not true that the Hooghly is, in the matter of pilotage, the most expensive port in the Queen's dominions?—I believe it is considered to be an expensive port.

6402. Very much more so than Bombay?—I am aware that the pilotage is very much higher than that of Bombay.

6403. Does the pilotage include towage?—No; the pilotage does not include the service for towing.

6404. The pilots of the Hooghly are paid at a much higher rate, and realise much larger incomes, than in any other port of India, do they not?—I have no doubt that their earnings are higher than in any other port, but at the same time I am aware that very great complaints have been made of the condition of the pilots at the present time.

6405. By the pilots, do you mean?—By the pilots.

6406. They are not satisfied with their condition?—They are not satisfied with their condition.

6407. Is their average income about 500*l.* a year?—You refer to the senior pilots, I suppose?

6408. I allude to the whole number of pilots?—The average remuneration of a mate pilot I understand to be about 400 rupees a month.

6409. That is the second class, is it not?—That is the third class; of the master pilot from 500 to 600 rupees; and of the branch pilot from 1,000 to 1,100.

6410. So that the average income will be somewhere about 600*l.* to 700*l.* a year?—No; the average, I apprehend, will be very little over 500*l.* There are three classes. The mean of those rates would doubtless be in excess of 600*l.*; but the number of branch pilots is only three or four out of a large number.

6411. Sir *Stafford Northcote*.] When you say so much a month, you mean taking the whole year round?—Yes; on the 31st of December 1870 there were 76 pilots.

6412. Mr. *Candlish*.] Have you any knowledge as to the time they are in active employment throughout the year?—No.

6413. Nor as to the adequacy or redundancy of the number of men for the work to be done?—No. I only know that there has been a considerable decrease in the number of the pilots within the last 10 years.

6414. That will have increased the income of each individual pilot?—Or have lessened the falling-off in their incomes.

6415. Unless the shipping has fallen off?—I mean with the same amount of shipping and the same charges.

6416. Has the shipping fallen off?—The shipping has fallen off.

6417. Is it your opinion that it would be practicable to reduce the pilotage port charges at Calcutta, seeing that they are higher than those of any other port we know?—I think it is natural to expect that they should be higher than any other port with which I am acquainted, because there are 120 miles of river navigation, and the mouth of the river is beset with shoal ground, and the channels are of a peculiarly shifting description.

6418. Are all the improvements to the river and starboard made out of dues levied upon shipping, or is anything done for the harbour out of the taxation of the country?—A large amount has of late years been spent, not on the harbour, but on the improvement of the lower channels of the river.

6419. Out of what fund?—Out of the general revenue of the country.

6420. I suppose that there, as elsewhere, Her Majesty's ships do not pay port dues; for lights, for instance?—They do not pay port dues, but the Government of India does contribute to the port fund an equal amount; it is, in short, charged to the revenues.

6421. In addition to the gross dues collected under the head of pilotage of 70,000*l.*, and 76,000*l.*, under the head of dockyard services, are there any dues collected as harbour dues or as light dues?—Not in that amount.

6422. Are those dues collected additionally?—Yes, by the local board.

6423. Then going to the 30,000*l.* received in Bombay under the head of Docks, that is not for a similar service to that rendered at Calcutta, but it is for the actual use of the docks by the mercantile marine?—It consists in part of the hire of

of the docks as I think I have already mentioned, but I have not got with me the exact amount received for hire.

6424. Then this income under the marine heading does not include pilotage or a corresponding charge at Bombay?—No.

6425. Or in any other port of India?—There is a small amount for Madras included; it is unimportant.

6426. *Chairman.*] We will now proceed to the next item of the account; there is an item you will observe, in the accounts for 1869-70 laid upon the table, of interest, 336,376 £.; will you be good enough to explain from what source that income is derived?—The most important item under that head consists of the interest on the Government Securities held as part of the reserve against the circulation of the paper currency. The amount of that item is 166,381 £. in the accounts for 1869-70.

6427. That would be the income on the ordinary rate of the public debt?—It is so.

6428. Representing a capital of how many millions?—About 3½ millions.

6429. Are those notes actually in existence, and deposited somewhere, or is it merely an item of account?—It is more than an item of account; the securities have been purchased in the open market, and a stock receipt is held in the name of two Commissioners nominated under the Currency Act.

6430. They in fact, then, are the trustees of the Government notes?—They are trustees of the reserve held in securities.

6431. Where are the notes themselves?—The stock receipt is in fact the note itself, and this is held in the custody of the Mint Master at Calcutta.

6432. The actual Government notes are given up and cancelled?—They are given up and cancelled.

6433. The stock receipt would entitle the trustees to receive the note from the officer of the Government on request?—That is so.

6434. What is the next item under that head?—The next item consists of the dividends received on the shares of the Government in the Banks of Bengal, Madras, and Bombay.

6435. Do they still hold shares in Bombay?—The Government holds shares in the Bank of Bombay.

6436. What is that item?—That item in the year 1869-70, is 20,293 £.

6437. What is the next item?—The next large item consists of the interest on loans to municipalities.

6438. Is that the interest that the municipalities pay to the Government for advances?—Yes, on specific loans. The amount is 77,765 £.

6439. Is any part of that a sinking fund to repay the capital?—No part of that is, but it contains an item of 18,262 £. received from the Calcutta municipality as interest upon a loan of 52 lacs of rupees, or 520,000 £. made for the completion of the water supply for the town of Calcutta, and in addition to this sum which consists of interest at 4 per cent. upon the amount advanced, the municipality pays 2 per cent. into the hands of Commissioners as a sinking fund which is in addition to the amount which appears in the account to the credit of interest.

6440. The sinking fund is accumulated by the Commissioners, and not by the Government?—That is so.

6441. They retain, as I understand you, this

sinking fund, and accumulate it, till they pay the capital, and do not pay it as an annuity from year to year?—No, they invest it in Government Securities.

6442. That does not explain the whole amount of interest under that item?—Then there is a sum of 59,500 £. as interest on loans to municipalities in Bombay. It is almost entirely the amount of interest upon a loan made to the Bombay municipality for a similar purpose, namely, for a water supply to the town including an advance of 15 lacs of rupees for payment of debts of the municipality, the principal amount of those 15 lacs being repayable by instalments in 10 years.

6443. Are the instalments all brought to credit in this item both for capital and revenue?—No; this consists only of the interest.

6444. *Mr. Candlish.*] At what rate of interest?—The rate of interest on the loans for the waterworks at Bombay is 4 per cent.

6445. *Chairman.*] Does that make up the whole of the item of 336,000 £.?—The remainder consists of unimportant sums, interest on arrears of revenue at Madras and Bombay, and certain quite unimportant miscellaneous interest receipts.

6446. *Mr. Cave.*] What were those loans to the municipalities intended for?—The principal loans that I have mentioned, are for the improvement of the water supply to the towns of Calcutta and Bombay.

6447. *Mr. Fawcett.*] The 166,000 £., which you say arises from the profit on the paper currency in fact represents, I suppose, the ordinary profit of a bank allowed to issue a paper currency?—This can hardly be said to be all profit, for against this there must be set on the other hand the whole of the expenses which are connected with the management of the paper currency.

6448. But it represents the gross profits, not allowing for the expenditure obtained by a banker who issues a paper currency?—It represents the profit obtained by a Government which issues a paper currency.

6449. Is there given a distinct item in the expenditure, showing at what cost that 166,000 £. is obtained?—No, there is not.

6450. Then there are no means from the accounts of ascertaining that?—No, not from the finance and revenue accounts; but under the currency law, an annual account of the whole profits, and the whole expenses of the paper currency, is required to be published, and is published.

6451. The next item which you referred to, I believe, is 20,000 £. for the dividends on the share which the Government has in the Banks of Calcutta, Bombay, and Madras; am I not correct in that supposition?—That is so.

6452. Can you tell me how much money they invested in shares, in order to obtain that 20,000 £.?—In the Bank of Bengal, the Government holds, or has invested, 22 lacs of rupees, that is, 220,000 £., being one-tenth of the capital of the bank.

6453. In Bombay, what did they invest?—In Bombay the Government has contributed 1 lac and 60,000 rupees.

6454. *Mr. Crawford.*] The new Bank of Bombay?—Yes, the new Bank of Bombay.

6455. *Mr. Fawcett.*] And what to the old?—In the old Bank they held 12 lacs of rupees.

6456. That has been lost, has it not?—Of that

Mr.
Harrison.

9 June 1871.

Mr. Harrison. the greater part has been lost; there has been a small return only.
 9 June 1871. 6457. What did they invest in the Bank of Madras?—Six lacs, 18,750 rupees.

6458. So that altogether the Government, in these bank speculations, have invested something over 40 lacs of rupees, in other words, more than 400,000 *l.*, upon which they get a revenue of 20,000 *l.* a year at the present moment?—The 20,000 *l.* does not represent any return upon the capital invested in the old Bank of Bombay.

6459. But the capital invested in the old Bank of Bombay has been altogether lost. Therefore, reckoning what profits the Government derives from a particular kind of speculation, you must put the good with the bad, and consider that the whole amount that they have sunk in these bank shares is 400,000 *l.*?—That is so.

6460. And in this year they obtained 20,000 *l.* from that?—That is so.

6461. Which is about 5 per cent., is it not?—Yes.

6462. And they obtained that 5 per cent., having lost a very considerable portion of their capital; so they obtain it at a very considerable risk, do they not?—It appears to me that now, although 400,000 *l.* was invested in the capital of these banks, the return is on a smaller amount, and therefore more secure.

6463. Yes, what remains; but then what really has taken place is this: the Government has borrowed money at 5 per cent., they have invested a portion of that money; or, at the same time that they have been borrowing, they have invested money, which only returns them in interest 5 per cent., and they have invested it in a security so uncertain that something considerably over a quarter of their capital has been lost. That represents accurately the nature of their financial transaction, does it not?—Looked at as an investment, the return for the year 1869-70 can scarcely be considered as fairly representing what the Government has received. The average dividend paid to its shareholders by the Bank of Bengal for the past 20 years is 10 per cent. Therefore the profits of these banks in a particular year of depression can hardly represent the return as an investment.

6464. But still looking upon it purely as a financial result, these figures show at the present moment that the Government has been borrowing money at 5 per cent., making an investment at the rate of 5 per cent., and making an investment of such a kind that they lose considerably more than a quarter of their capital. That is what has taken place, is it not?—They have in this particular year received but 5 per cent. upon the whole sum originally invested.

6465. Mine is not an incorrect description, is it?—No, except so far as it assumes the return in this particular year to be the ordinary return.

6466. My description represents accurately the nature of the financial transaction in the last year, does it not; I will take any other year and see what the nature of the financial transaction was then; what was its nature in the year before, for instance?—It will be about the same then.

6467. Mr. Candlish.] Ten per cent. over an average of 20 years?—That is the case as regards the Bank of Bengal, which is two-thirds of the whole investment.

6468. Mr. Favocett.] But taking 20 years, do the figures show that, taking the average of the 20 years, the Government upon the whole of

their bank investment have obtained an interest of 10 per cent.?—They will show that with reference to the particular investment of 22 lacs in the Bank of Bengal, and they will show a higher return than 5 per cent. in the case of the amount invested in the Bank of Madras.

6469. Can you give any general opinion, considering the most serious loss which the Government incurred as to the advisability of Government obtaining revenue from bank investments?—The prospect of revenue would not be sufficient reason for such investments.

6470. You think that, as a question of revenue, the Government ought not to invest money in so speculative a concern?—As a question of revenue, I should say not.

6471. I understood you that the next item of which this revenue described as interest is composed, arises from loans advanced to the municipalities of Calcutta and Bombay, and that the interest which is paid on these loans is at the rate of 4 per cent.?—That is so.

6472. Do you consider the security perfect?—I consider the security good.

6473. Is there no practical risk; for instance; do you think that an individual in Calcutta or in Bombay, would as soon lend money to the municipality as he would to the Government?—The debentures of the municipalities neither at Calcutta nor at Bombay bear so high a price in the market as those of the Government.

6474. Can you give me an idea at what rate, for instance, the municipality of Bombay or that of Calcutta could borrow money in the open market?—About 5½ per cent., the municipality of Calcutta.

6475. So that the Government makes them a present, or at any rate taxes the rest of the people of India to a very considerable extent in order to make a present to the municipalities of Calcutta and Bombay of 1½ per cent. interest?—It was put in that form by the Government, but it was assumed to be 1 per cent. It was considered that a contribution was made from the general revenue for procuring a water supply to the town of Calcutta involving a payment of 1 per cent. on the amount that had to be raised by loan.

6476. And while the Government is lending money at 4 per cent., they are actually at that very time borrowing money at 5 per cent., are they not?—Yes, that is so.

6477. Have they not in every year borrowed money at nearly 5 per cent. during a long succession of years?—The latest operations have not been at so high a charge.

6478. What is the least at which the Government has ever borrowed money; 110 has been asked, has it not?—That would hardly represent the rate at which the money was borrowed by the Government; the latest large operation in India was when about 2,000,000 *l.* of 4 per cent. stock were issued at the price of 90½, which will be somewhat less than 4½ per cent.

6479. Were there any advantages connected with that loan in the way of paying it off at par, or anything of that kind?—No.

6480. But still as a fact the Government have never borrowed money at less than 4½ per cent., have they, at least considerably over 4 per cent.?—No.

6481. And at the same time that they have been doing this, they have lent money to the municipalities of Calcutta and Bombay at 4 per cent.?—That is so.

6482. Therefore the rest of India has been taxed

taxed in order to lend money to the two wealthiest cities in India at below the ordinary market rate?—That does not seem strictly accurate, for the whole of India includes those wealthiest cities.

6483. But the other people of India, for instance, the people of Madras, and the people who live in the country, have been taxed in order to lend money to wealthy communities, like the Calcutta and Bombay communities, at less than the ordinary market rate?—No doubt a contribution has been made from the general revenue for the benefit of those municipalities.

6484. Mr. Crawford.] With regard to the uncertainty of the investment in the bank shares, how long has the Bank of Bengal been in existence?—From the year 1809.

6485. And it is a flourishing, well-conducted institution, is it not?—It is.

6486. The Bank of Madras has been in existence also for a considerable number of years?—Yes.

6487. And that is also paying a good dividend, and is understood to be well managed?—Yes.

6488. The Bank of Bombay is the only exception, then, to the success which has attended the banks in which the Government has invested?—That is the case.

6489. Do not the Government derive considerable advantage from the services of these banks?—I think they do.

6490. In former days used there not to be a Government treasury where the cash was kept, and from which the treasurer had to disburse money?—That was so.

6491. That is all abolished now?—Yes.

6492. And the Government banks do that service for them in the same way as the Bank of England here does the Government business?—Very much in the same way.

6493. Does the bank receive any payment for that?—None at the present time.

6494. Then, in addition to the 5 per cent. yielded by these banks to the investment which the Government hold in their stock, the Government get the advantage of a large service rendered to them by these banks gratuitously?—That is so.

6495. And they have at the same time, through the fact that they are interested in these banks, a sort of control over the agency which does their business for them?—They have considerable power of control.

6496. With regard to the municipal security, is it not a security represented by house property of a very valuable character?—It is.

6497. And there is a power of rating given to the municipality under Statutes by the Indian law?—Both municipalities have that power.

6498. Then, in point of fact, the Government hold as security for these loans about the best security that can be had for a loan, that is landed property?—The security seems ample.

6499. It is landed property in large, populous, and continually increasing cities?—Yes.

6500. Do you know the population of Calcutta?—I believe about 700,000.

6501. And the population of Bombay is not less?—The population of Bombay is quite as much.

6502. I believe that the Government of India have been borrowing through the Indian Home Government in this market very largely at 4 per cent. have they not?—Yes.

6503.

6503. And those moneys are equally available for the service of India as moneys borrowed in India, though raised here, that is to say, the Government by borrowing money here do not draw upon the revenues in India?—Yes.

6504. Therefore the Government borrowing in the market here at 4 per cent., and lending money to the municipalities at 4 per cent., no loss is sustained in that operation?—No loss is sustained.

6505. Your answer just now, therefore, was not correct, was it, on that point?—The answer that I gave was that it was considered at the time that the course that the Government took was equivalent to a payment of interest at 1 per cent.

6506. But the debt that bears that interest is debt contracted in India as distinguished from debt contracted here?—Yes.

6507. Can you tell me the principle on which the profits of issue are calculated?—It is the actual amount of interest or dividend on the securities purchased, the actual amount realised.

6508. Purchased by cash received from the public for notes?—Yes.

6509. Chairman.] You mean the money received by the Government from the banks who give it them?—The banks have no concern with the management of the currency; 3½ millions is the whole amount invested.

6510. The Government receive cash for the notes?—Yes.

6511. And they invest a portion of the cash they receive in these securities?—That is so.

6512. What proportion at the present moment?—It is not strictly a proportion, it is a fixed sum; the limit fixed by law at present is 60,000,000 of rupees that may be invested in securities; the amount actually invested is about 3½ millions sterling.

6513. Mr. Birley.] The Government holds, I suppose, considerable balances in these banks?—Yes.

6514. Are those without interest, or do they carry interest?—Those are without interest.

6515. Is that supposed to be the remuneration for the services rendered by the banks to the Government?—It is supposed to be.

6516. But is the holding of any part of the bank shares by the Government a part of the condition of the bargain with the bank?—It is not any part of the bargain by which the bank is remunerated for the service performed. These shares have been held from the institution of the banks in each instance, and the services performed by the banks are of recent date.

6517. What particular object is there in the Government holding these shares of the bank, or how does the bank benefit by it?—That opens a very wide question.

6518. I did not quite understand the object that the Government had in holding bank shares; can you briefly state it?—The object is certainly not that of direct return for the money invested; it is for the support of these banks. The bank of Bengal, which is the earliest of them, was constituted more than 60 years ago, at a time when it was thought that a strong local bank could not possibly be constituted without the direct aid and countenance and assistance of the Government and of Government officials, and this unquestionably led to the arrangement by which the Government became a subscriber to a portion of the capital of the bank.

6519. But the necessity for all that has passed away

Mr.
Harrison.

9 June 1871.

Mr.
Harrison.
9 June 1871.

away long since?—That is very much a matter of opinion. Up to the present time there has not been any instance of a strong local bank independent of the Government; I mean a bank confined entirely to local interests.

6520. Will you inform me what object the Government has in lending money at 4 per cent. to the municipalities of Calcutta and Bombay; is there any return for that beyond the 4 per cent.?—No money return; it is done in the interests of two metropolitan cities.

6521. What should you consider was the normal rate of interest on Government loans?—Do you mean in return for an investment at the present time?

6522. The average rate of interest charged upon Indian debts payable by the Government of India?—It must be about 4½ per cent.

6523. Mr. *Beach*.] I understand that in the establishments of these banks it was absolutely necessary for the Government to assist, or else there would have been some difficulty in the shares being taken up?—I consider that that is the case.

6524. It must be considered, not in the light of an investment, but as assisting in the establishment of institutions absolutely essential for the welfare of the country?—I think so.

6525. I presume that since the circulation of bank notes these banks are in a much better position than they were in before that time?—These banks had in each instance the privilege and advantage of issuing their own notes (with the exception of the new Bank of Bombay, which is an institution of the last year or two only), which was no doubt profitable, and that they have lost.

6526. Does that render them in a worse state?—They have lost a certain source of advantage or profit.

6527. Sir *S. Northcote*.] I should like to ask you a question with reference to the connection of the Government with the new Bank of Bombay. That is a matter of recent arrangement, you say; are you aware that that agreement of the Government to take shares in the new Bank of Bombay was a subject of considerable doubt, and that the decision that shares should be taken was arrived at with an understanding that the whole question of the connection of the Government with the banks should be reviewed?—I believe that is so.

6528. Do you know whether the subject is now undergoing consideration by the Government?—I have no information of the action of the Government at the present time.

6529. Then I will not ask you any further questions upon that point. With regard to the advances to the municipalities, have there been any instances of sums advanced to either Calcutta or Bombay which have been either lost, or of which the repayment has been delayed?—No, there has been no instance that I am aware of.

6530. Not in Bombay?—I am not fully acquainted with the history of the loan for the Bombay Waterworks.

6531. With regard to some of the reclamations at Bombay, was there no money advanced there which there was a difficulty in recovering?—It has been recovered in an indirect way lately, by the Government having taken over the whole of the works, I think.

6532. But as a matter of fact, was it not the case that money was advanced by the Central Government to Bombay with a view to certain

improvements and reclamations of land which were undertaken at a time when there was considerable appearance of prosperity at Bombay, which advances there was difficulty in recovering, and which formed an item of difficulty in some of the budgets, or, at all events, were admitted to be difficulties?—Yes, that is so.

6533. With regard to advances at Calcutta, or in the neighbourhood of Calcutta, are you acquainted at all with the circumstances of the advance connected with Port Canning?—Yes, I am aware of that.

6534. Was there not money lost in connection with that?—Money has been lost.

6535. Do you know to what extent?—The amount of direct loan to Port Canning was, I think, 4½ lacs of rupees, and there has been, and probably will be, no return of any part of this money.

6536. The Government have had to take over the South Eastern of Bengal Railway, have they not?—Yes.

6537. They are now working that railway at the Government expense?—They are indirectly, through the Eastern Bengal Railway; it was called the Calcutta and South Eastern Railway.

6538. Mr. *H Burke*.] What, as far as you can say generally, is the bank-rate charged for accommodation for discount and interest?—The rate varies from a minimum of five or six to a maximum of 12 or 14 per cent.

6539. And what is the average rate of interest or money in the Presidencies?—As to the interest on landed security, do you mean?

6540. Yes; give me any information that you can on that point; take the landed securities first?—The interest on loans on house property is from 6 to 8 per cent.

6541. And I think I understood you to say that the average dividend paid by the banks in that item, which you gave me, might be taken to be 10 per cent.?—Not exactly that; but the average dividend paid by the Bank of Bengal, which is probably somewhat higher than that of the others.

6542. And the actual interest received by the Government upon what Mr. Fawcett called their bank speculations, is about 5 per cent. at the present moment?—In the year 1869-70.

6543. Then I think you said (I only want to understand the point), in answer to the honourable gentleman, the Member for the City, that these banks transacted the business of the Government, and that that was a considerable advantage to the Government?—Yes.

6544. But then I understand you to say, in answer to another honourable gentleman, that the bank enjoyed very considerable balances, so that the connection with the Government was a valuable one for them?—No doubt.

6545. Mr. *Candlish*.] I think you qualified the first answer which you gave to the Right Honourable Baronet the Member for North Devonshire, that there had been no loss from, or postponement of, payment by these municipalities?—My doubt has reference to a large loan for the Bombay waterworks of about 38 lacs of rupees. In regard to this loan I believe that it has been a matter of considerable difficulty; the municipality has felt itself unable to make those arrangements for the liquidation of the capital sum of this loan which it has been thought proper to demand from them.

6546. And also the reclamation works at Bombay?—And the reclamation works.

6547. And

6547. And also some works at Calcutta to which you have just referred?—That is a final and total loss probably if looked upon as a loan, but it was for the making of an entirely new port at a distance from Calcutta.

6548. In point of fact you have saved yourselves as you suppose, in some cases, by taking over your securities as at Bombay for instance; though it was a bargain of sale and purchase, yet I apprehend it was a necessity that you should take the works at Bombay to save your money?—Hardly so; the direct advance to this Reclamation Company was but a small part of the value of the works; it was considered desirable to take over the whole works, but hardly as security for the particular advance made.

6549. The average rate that you are paying for your whole debt now is $4\frac{1}{2}$ per cent. you say, do you not?—It would be about $4\frac{1}{2}$ per cent.

6550. What money are you getting from England at 4 per cent.?—Within the last few years several amounts have been raised in England at 4 per cent.

6551. To what amount?—I am unable to give specific information.

6552. At the time you were lending money to those municipalities at 4 per cent. you were borrowing for Imperial purposes at 5 per cent.?—At one part of the time.

6553. You were then paying 5 per cent.?—Paying on the debt generally.

6554. It will be correct, then, to say that you were losing 1 per cent. by the money which you lent to those municipalities?—It was so considered at the time that the loan was agreed to; it was thought that a payment of 1 per cent. was made.

6555. And you did not advance this money only for prospective works, but to repay debts contracted by the construction of its works, debts to the amount of 15 lacs of rupees, were incurred in Bombay?—Yes.

6556. Then, in point of fact, by that one transaction paying off an old debt you lost 1,500 l.?—The rate of interest on that particular loan was 6 per cent.

6557. You did not lose by that transaction, then?—No.

6558. Did you say that the amount of the loan to the Bombay municipality was 750,000 l.?—No; the amount of one loan to Calcutta was 520,000 l. The amount of the loan to Bombay for waterworks was about 380,000 l., and there was a loan to the Bombay municipality of 15 lacs or 150,000 l., and there are other loans amounting to, altogether, 1,401,000 l.

6559. And you are losing, or were losing, upon that sum?—By no means upon the whole of that; even upon what it was considered that there was a loss of 1 per cent. upon, there is not, I think, so great a loss.

6560. Reckoning it at 1,000,000 l., you lose 10,000 l. a year?—One per cent. upon 1,000,000 l. would be 10,000 l. a year.

6561. Mr. Grant Duff.] You explained, I think, that the Government invested in the shares in the banks with a view to call these banks into existence for the convenience of itself and the general Indian public?—Yes.

6562. But looking at the matter merely as an investment, has the Government made a very bad thing of its connection with these banks?—No, I should say not.

6563. It has received a very fair and reasonable interest for its money?—No doubt.

6564. And I presume it could sell its shares now in these banks, so as to repay it for all it has invested, including the amount it has lost in the old Bank of Bombay?—The market price of these shares is very much in excess of the value contributed by the Government.

6565. Chairman.] Would it be sufficiently in excess of the capital to repay that which was lost by the failure of the old Bank of Bombay?—Yes; certainly.

6566. Mr. Grant Duff.] The Government would be no loser if the transaction were wound up to-morrow?—No.

6567. Sir Stafford Northcote.] Have you taken into account the consideration whether the fact of the Government selling the shares would affect the price of the shares?—My reply was merely with regard to the present market value of the shares.

6568. Do you consider that the market value is to any extent enhanced by the fact that the Government are shareholders?—I think it may be doubtful whether the 2,000 shares which the Government holds in the Bank of Bengal could be readily sold.

6569. Mr. Candlish.] Is the 120,000 l. the whole of your loss with the old banking firm of Bombay?—Very nearly the whole of that is lost; 9,000 l. has been recovered.

6570. Will that cover your whole loss?—Yes; indeed there may be some further small returns.

6571. Are there no claims against that Bank at present, shareholders' claims?—I apprehend that no claim could be enforced.

6572. The shareholders are claiming of the Government of Bombay, are they not?—Claims have been made.

6573. Mr. Fawcett.] Is there not this disadvantage from the Government holding shares in the Bank, that as we have seen in the case of Bombay, very urgent and pressing claims are put upon the Government; that it was to a certain extent the Government Bank, and that the Government is bound to make some return; that claim is very widely put forward, is it not?—I have no doubt that inconvenience was felt by the Government.

6574. Can you by specific figures prove that if the shares which the Government at the present moment holds in the Bank were sold, it would cover the loss?—It is impossible for me to say what would be realised.

6575. I mean taking the actual price; do you state from actual figures that that could be done?—I have no doubt of the fact.

6576. What premium are they at in Bengal now?—I have not seen very recent returns, but it must be very little less than 50 per cent.

6577. As a matter of fact, with regard to the Government never having lost money, and with regard to the security which the Government has in investing in municipalities at 4 per cent., is it not the fact that they advanced a considerable sum of money to the Calcutta Port Fund, which in 1859 was wiped off as a bad debt, the whole of it being lost?—Yes, that is so.

6578. Then some of these reclamation schemes are certainly not a good security, are they, or else the Government would not have taken them

Mr.
Harrison.
9 June 1871.

Mr.
Harrison.
—
9 June 1871.

over against their will?—No; the advances to the Calcutta Port Fund to which you refer were made under the authority of an Act of the Indian Government Act, No. 22, of 1855, which provided that all sums required for the purposes of the Act should be advanced by the Government.

6579. How much was advanced to the Calcutta Port Fund?—It was an open running account; all the expenses are paid from the Treasury, therefore it is difficult to say what was the amount of the advance at any point of time.

6580. What is the amount of the whole advance?—The amount at the present time of the advance to the Calcutta Port Fund is stated at 12 lacs 55,000 rupees, 125,000 £.

6581. That has been wiped off as a bad debt. You get no return from that?—The actual entire loss will probably considerably exceed the sum that I have named.

6582. Would it be an exaggeration to say that the loss will be 200,000 £?—No, I think not at all.

6583. And I understand you, from a previous answer, that altogether about 500,000 £ has been advanced to the municipality of Calcutta?—I did not include the advance to the Calcutta Port Fund in that; 520,000 £ is the amount.

6584. Therefore, including the amount advanced to the Calcutta Port Fund, the amount advanced has been 720,000 £?—Yes, taking the two together.

6585. Therefore, what the nature of these transactions comes to is this, that you advance 720,000 £ to a municipality at 1 per cent. below the ordinary rate; you borrow money at 5 per cent. to do that, and you invest it in such imperfect security that nearly a third of the whole capital is actually lost?—The securities in the two cases, as well as the purposes for which the advances were made are entirely distinct.

6586. That is one part of the transaction, is it not?—No; the advance to the Calcutta Port Fund can in no sense be considered an advance to the Calcutta municipality.

6587. But suppose the Calcutta Port Fund had paid interest, it would have been put down, would it not, under this item that we are now considering?—Yes.

6588. Therefore it represents a portion of the capital from which this revenue is obtained?—Yes.

6589. And therefore I am perfectly correct in saying that regarding this revenue the Government advanced, so far as Calcutta is concerned, 720,000 £ at 4 per cent. interest, borrowing the money at 5 per cent., and losing a third of the capital?—Calcutta, including the Port Fund, has had that amount.

6590. Can you explain the very curious fact that these advances have not been made to other municipalities except Bombay and Calcutta?—That is hardly the case.

6591. Where else have they been made?—An advance to the municipality of Kurrachee of 63,000 £ has been sanctioned, although no payment was made up to the close of the year 1869-70. Again, an advance of 20,000 £ has been sanctioned for the completion of a canal round the town of Madras; of that but a small part has been actually advanced, apparently only 3,000 £, of which 1,000 £ has been repaid. Then, to the Madras municipality, for water supply alone, an advance has been sanctioned of 128,000 £,

of which 5,000 £ has been actually advanced at 4 per cent.

6592. Now, as a matter of account, I should like to ask you this question; we have a revenue obtained partly from interest on bank shares, and partly from interest on advances made to municipalities; with regard to each of these advances, the nature of the security is so extremely bad, that a quarter of the capital has been lost in one instance, and in another case nearly a third of the capital has been lost, namely, that which has been advanced at Calcutta; that being the case, considering the risky nature of the investment, would not ordinary prudence require that you should not devote the whole of the interest received from these loans to income, but that you should devote a very considerable portion of it as a sinking fund, to recompense you in the case of these losses which you incur?—In the case of the largest of these loans which I have referred to, that of 520,000 £ to the Calcutta municipality, I have already explained that, in addition to the sum which appears in the account as interest, and which is calculated at the rate of 4 per cent., a sum of 2 per cent. is paid, making the charge to the municipality 6 per cent., the 2 per cent. being held by commissioners, and invested in securities of the Government as a sinking fund.

6593. But still that does not meet my question; if you invest in a speculative security, in a security which involves not only a possible suspension of interest, but also a possible loss of your capital, can you in prudence devote the whole of your returns to income?—In this case that is not done.

6594. But you devote the whole of the 4 per cent. to income?—The whole of the 4 per cent.; but the whole of the 4 per cent. is not the whole of the return; the whole of the return is 6 per cent.

6595. But taking it with reference to the bank shares, is that the cost?—In regard to the bank shares the capital invested is not only intact, but represents a larger amount of present value.

6596. But you would have given me a similar answer if I had put you a similar question, a year before the Bank of Bombay failed, would you not: the Bank of Bombay then was supposed to be as flourishing as the other banks, and yet it failed, and the Government lost all this capital; and looking at the experience of the past, can you consider that the Government have invested their money in concerns which involve no risk?—It is impossible to say that the investment of money in the Bank of Bombay involved no risk.

6597. Then that being the case, ought you prudently to devote the whole of this sum which is put down as revenue to income?—The recent loans to municipalities individually are sufficiently secured. The fact that one investment is bad, does not seem to show that another must be.

6598. As to the railway which has been alluded to, did not the Government buy the railway?—Yes, the Calcutta and South Eastern Railway.

6599. Did not they advance money to the Orissa Irrigation Works, from which they had a very considerable loss in the same way?—I am not aware that there is any loss. They have taken over the works of the Orissa Irrigation Company on terms with which I believe the shareholders were hardly satisfied.

6600. At the present moment, there is a loss to the Government, is there not, on the amount which they have so expended; that is, there has not

not been a profitable return?—There is no sufficient immediate return.

6601. Therefore, at the present moment, it represents a loss?—At the present moment it may be said to represent a loss or an investment.

6602. Mr. *Birley*.] With regard to that 200,000 £ for the port of Calcutta, is there any great improvement in return for that money?—A very great improvement in the moorings which have been laid down, at a very great expense, for the accommodation of about 200 ships of all sizes.

6603. Then, although the Government has lost the money, the port of Calcutta has received

improvement, either equivalent to that 200,000 £, or equivalent to a portion of it?—Yes.

6604. Should you consider that the improvement was equivalent to the 200,000 £?—I should think it was.

6605. Mr. *Cave*.] Are those irrigation works which you mentioned just now still in operation?—I cannot give precise information with regard to the position of the Orissa Irrigation Works.

6606. Mr. *Cundlish*.] Are the whole of these loans on terms leading to a gradual yearly reduction?—That is the character of the recent and principal arrangements.

Mr.
Harrison.

Mr. McClure.
Sir Stafford Northcote.
Mr. J. B. Smith.
Sir David Wedderburn.
Sir Charles Wingfield.

THE RIGHT HONOURABLE ACTON SMEE AYRTON, IN THE CHAIR.

Mr. EDWARD FRANCIS HARRISON, re-called; and further Examined.

Mr.
Harrison.
—
13 June
1871.

6607. *Chairman.*] WITH reference to the item which appears in the account for 1869-70 of "Miscellaneous Receipts" in India, 1,446,982*l.*, will you state to the Committee of what various receipts that total is made up?—It is composed generally either of amounts which do not fall under any of the principal heads of revenue, and are not of themselves of sufficient importance to be separately stated, or else in some cases they are casual and extraordinary receipts, the inclusion of which in the heads of revenue with which they are connected would be inconvenient as tending to vitiate comparative results.

6608. Are all these receipts, or are the receipts under all these heads every year, or some of them only for a single year?—Of some of them it is true that they occur every year, but such are for the most part inconsiderable separately, and are therefore shown as miscellaneous; but some are casual, and do not recur.

6609. Will you take them in their order, if you please?—The first amount is 42,328*l.*, which consists of gain on transactions with London.

6610. What do you mean by "gain on transactions with London"?—It occurs in this way; there are certain large amounts advanced in England for payment of annuities to retired members of the Civil Service, and to annuitants upon certain provident funds connected with the Civil Services on which this arises. The annuitants are paid in England. Annuities of 1,000*l.* are repaid to the Government in India by the trustees of the fund from which the payment is made, at the rate of 10,000 sicca rupees, which is equal to 10,666 and two-thirds Government rupees, being 6 per cent. more than the amount paid in England when compared with the official rate of exchange of 2*s.* This results in a gain in account equal to 6 per cent. on the total amount of these annuities disbursed in England. Then on the annuities that I referred to connected with provident funds of the Civil Service, the amounts are repaid to the Government in India by the

trustees of the several funds at the exchange of 1*s.* 11*d.* the sicca rupee; that is equal to an exchange roughly of 1*s.* 9½*d.*, the Company's or Government rupee; but inasmuch as the repayment is made 12 months after date, the transaction is equal to an exchange of about 1*s.* 10½*d.*

6611. Then is this considered to be the gain of the Government in the exchange?—That is considered to be the gain of the Government.

6612. Is that an item which fluctuates according to the course of exchange, or is it merely the difference between two official rates?—It is merely between two official rates; and there is no fluctuation.

6613. It depends entirely upon the amount paid in London?—Yes.

6614. That would be a constant item?—It may be considered a constant item.

6615. What is the next item?—The second item that I have is premium on bills, 7,343*l.* This consists of the premium realised upon drafts issued by one treasury in India upon another.

6616. It depends upon the rate of exchange?—Yes.

6617. There is always some premium, more or less?—There will be some premium occurring in every year, but on the other side of the account we shall find a loss or discount on other transactions.

6618. Mr. J. B. Smith.] Is that 7,000*l.* the balance of profit and loss?—No; it is the actual premium realised on particular transactions.

6619. *Chairman.*] That is to say, taking the exchanges where the premium is received, and where there is a loss, it goes to some other part of the account?—Yes.

6620. Then the next item is premium on money orders; what does that amount to?—£. 15,539; that is a premium or commission at the rate of about 1 per cent. I say about 1 per cent., because it is a fixed rate of commission on orders of particular classes.

6621. Which the Government grant from one treasury on another?—Yes.

6622. Then the next item is unclaimed deposits;

posits; what does that amount to?—£. 90,946; these are deposits made in the Government treasuries on various accounts, and if unclaimed within three years, or rather before the close of the fourth year, including that of the receipt; they are carried to revenue, and if thereafter they are paid the payment will appear under the head of refunds.

6623. As a deduction from the miscellaneous receipts which is represented by the sum of 101,045 *l.* in the account for 1869-70?—Yes.

6624. What is the next item?—The next item, "unclaimed bills," is of the same character; the amount is 104,460 *l.*

6625. Is that treated in the same way?—That is treated in the same way; but the sum of 101,000 *l.* that under appears "allowances and refunds," must be considered in connection with these two items.

6626. Do you happen to know whether there is any real profit on these transactions, or whether ultimately they all come to matters of account?—In regard to deposits, I think that it may often be that sums are retained as deposits which might more properly be taken in the first instance to the revenue account, putting such deposits aside, I cannot think that there is any real gain on transactions of this kind.

6627. What is the next item?—The next item is Government printing presses 13,225 *l.*; that consists of the sums received by sale of official publications and official army lists and Government gazettes, and so forth.

6628. Do you mean the net result of their printing operations, or simply the income?—This is simply the income, the amount of cash receipts.

6629. Does the expenditure appear on the other side of the account?—Yes.

6630. What is the next item?—The next item is a very important one, amounting in the total to 493,598 *l.* connected with the military funds; that consists first of subscriptions to these funds amounting to 248,645 *l.*

6631. Do you mean that that is the money that is deducted from officers' pay, or otherwise received from officers as contributions to various military funds?—Yes, that is so.

6632. Then that is not carried now to any separate account kept of the military fund, but it goes into the revenue?—It now goes into the revenue.

6633. Does the whole of the expenditure from this fund go into the other side of the account?—It does; it is a comparatively new thing in the Finance Accounts; it had its origin in the changes in the organisation of the Indian army which followed the measures of 1858.

6634. Formerly a separate account was made, and then the Government assumed the management of these funds?—The Government assumed the management of these funds under the authority of an Act of 1866, by which the Government took over the capital of the funds together with all their obligations. The interest of officers in the funds was guaranteed to them; the subscriptions are now carried to revenue, as we have seen, and the charges for pensions are taken as charges against revenue, and further, the difference by which the annual charge exceeds the annual receipts is taken to revenue by charge to the capital accounts of the funds.

6635. Will you explain why this item does not appear under the item of miscellaneous receipts of the army in the general account?—All these

funds in their inception were formed by the voluntary association of the officers of the different branches of the service, the arrangements having been in each case made with the approval of the East India Company, and the contribution of the Company, or the charge upon the revenue, consisted in the main of the allowance to these funds of a favourable rate of interest upon the amounts which they deposited in the Government treasuries.

6636. By which you mean the rate of interest some per-centage higher than the public debt or the Government Bonds at the time?—Quite so. It seems to have been looked upon rather as an arrangement for the general advantage of their servants than as a military charge.

6637. But was not all that changed when the Act of Parliament was passed, which distinctly said that it should be an incident of the military service that Government should pay those things?—It is a question whether it would not, under present circumstances, be more proper to deal with these payments as military charges.

6638. What is the other item which made up that sum of 493,000 *l.*?—Excess of payments over receipts, 244,953 *l.*

6639. What payments in excess of receipt are those?—When this change was made, instead of showing the entire capital of the funds transferred as revenue of the year in which it was taken over it was arranged that the difference only between the charge of the year for pensions and the subscriptions of officers received in that year should be taken from the capital account of the fund and placed to the account of revenue.

6640. Do I rightly understand you then, that this, though appearing as a receipt, is a sum entered to balance the payments?—It is so.

6641. The whole payments being in excess of the subscriptions for the year by 244,000 *l.*?—That is so.

6642. And then is this receipt derived by the sale of a portion of the capital fund made over to the Government in 1866?—No, it is a matter of account. The entire capital of these funds remaining appears in the statements of account as deposit not bearing interest.

6643. That is in the Account at page 63?—Yes; the sum transferred to revenue will be included, or a great part of it will be included in that item in the first column of deposits 449,761 *l.* That is so far as relates to the military funds of the Bengal Presidency. Those of Madras and Bombay will be under the corresponding heads of Madras and Bombay.

6644. What do you say as to this item on the same page of "Service Funds," 831,323 *l.*; what are those?—Those will be the funds which are now recognised as service funds bearing interest; funds of the Civil Service.

6645. Then where is this drawn from; where is the fund shown from which this money is obtained. That only represents payment; but is it now part of the capital of the debt of India, and is it shown in that, or is it shown as a balance in the general treasury account, or how is it shown?—It is shown among the obligations of the Government. The amount of the obligations of the Government on accounts that are not bearing interest is not stated in these Finance and Revenue Accounts.

6646. It used to be, used it not?—It has been returned from time to time, but not I think in the annual statement; the amount of debt bearing

Mr.
Harrison.
13 June
1871.

Mr.
Harrison.
—
13 June
1871.

bearing interest, is there; but not that portion of the obligations which does not bear interest.

6647. You think that the capital whatever it may be that was made over does not appear in these printed accounts before us?—No.

6648. Do you know what the amount is?—The amount at the close of the year 1869-70 was 2,931,528 *l*.

6649. Then the Government will be at liberty to appropriate that capital to make good the deficit so long as it lasts?—That is the case.

6650. Do you know whether any calculation has been made to show that by the time that is exhausted the charge will cease, or will the charge come upon the revenue?—I can form some estimate of the time within which these funds will be exhausted; it varies in the case of the several funds. There are two funds connected with the Bengal Army, the Bengal Military Fund, which provided pensions to the widows of officers of the army, and also some other objects; and there is a second one, the fund of the Military Orphan Society, which had separate obligations; the capital of the Bengal Military Fund consists at present, as appears on the accounts, of 473,000 *l*, and taking the payments as at present and the receipts as at present, there is an annual deficiency of about 74,000 *l* which will exhaust the fund in somewhat less than seven years. In the case of the Military Orphan Fund the capital amounts to 480,000 *l*, the payments to 62,420 *l*; the receipts to 50,180 *l*, and the annual deficiency is about 12,240 *l* which will exhaust the fund in about 40 years; but I should perhaps mention that in both these cases as well as in those of the other funds which I have not come to, it does not follow from the fact that the capital will be exhausted before the annuities lapse that these several funds are not solvent, because they are no longer credited with interest on the capital sum in the hands of the Government. If interest were allowed upon the capital it might be that the subscriptions, together with the interest, would be amply sufficient to meet all future obligations.

6651. If that were done, on the expenditure side of the account there would be an addition to the public expenditure of the interest?—Quite so; the effect at present so far is that the annual charge for interest has been saved.

6652. When you say saved, you mean that the annual charge for interest has not been made; it is not saved?—No, it is not ultimately saved, it is merely on the account as stated.

6653. And the deficiency is made up by the capital?—The deficiency is made up from the capital.

6654. Could you tell us in general terms when, treating the thing as a whole, the capital will be exhausted by this process, I mean that capital of two millions and odd, which you have mentioned?—I should estimate from 12 to 15 years.

6655. At the end of the 12 or 15 years, will the charge on the fund have so altered under the new arrangements, that it will be diminished so as to come within the subscriptions?—It would require a careful actuarial estimate to determine the probable position on the exhaustion of the capital.

6656. But without going into a minute account can you explain to us the principle upon which the arrangement proceeds: does it proceed with a view to the subscriptions at the end of that period of 12 or 15 years, being sufficient to pay the charge on the fund?—No, there will be an

ultimate charge until the whole of the annuities are extinguished.

6657. Without going into a minute estimate, what do you suppose it would be, would it be a charge equal to that of the present year, or would it be a gradually diminishing charge?—No doubt it will be a gradually diminishing charge, the funds having been many years in existence, and being closed against new entrants, the maximum annual charge has doubtless been reached.

6658. Then how long do you suppose it will last as a charge upon the revenue over and above the receipts?—I presume for the greater part of a century. The funds are applicable to the support of the widows and children of officers who entered the army up to 1859, I think.

6659. Then they must live a long time if the charge will last as long as you say?—The widow of an officer entering the army at the age of 17, in 1859, and who should marry after 30 years' service, may well be living in 1959.

6660. It would come to an end then with the lives of persons now in the public service?—With the lives of the widows and orphans of persons now in the service.

6661. Mr. J. B. Smith.] The widows and orphans of soldiers killed?—No, of officers of the army who may have entered the service previous to 1859.

6662. Chairman.] They are entitled then to have the fund kept up, and to have the annuities paid to them, which the officers' widows and children previously received, and the officers who entered previously to 1859, are bound to continue to pay their subscriptions during the rest of their public service?—That is so.

6663. And then after the subscriptions have ceased, and after this capital fund is exhausted, we understand there will be a considerable surplus of charge that may be prolonged for a good many years afterwards, and that will be a dead charge?—That will be a dead charge.

6664. Mr. J. B. Smith.] Did I rightly understand you to say, that the capital was invested in Government securities?—No; the capital was deposited with the Government, and interest was allowed upon it, until the time that the capital of the fund was taken over by the Government; after that, there could be no object in allowing interest.

6665. But in estimating the loss, it would only be just to calculate interest upon the capital which the Government have in hand?—Certainly, in order to arrive at any conclusion as to whether it is a gain or a loss.

6666. Chairman.] What you are doing practically by those arrangements, as I understand you, is this; you are relieving the annual expenditure of what is a charge, namely the sum representing the interest of two and a half millions of money, and you are putting that charge upon the future revenues for any period that may last from 15 years hence to the end of a century?—That is the effect of the arrangement.

6667. Then that would account for 493,598 *l*. under miscellaneous receipts; but do you think that in any new arrangement under an Act of Parliament, this ought to go over to the army and be treated as an army receipt and expenditure?—It would perhaps be a better arrangement.

6668. Will you go to the next item?—Old stores and materials 8,236 *l*, that is simply miscellaneous

cellaneous stores of the Civil Department, proceeds of packing cases, waste paper, and that sort of miscellaneous receipt.

6669. What is the next item?—£. 5,712, "sale of Durbar presents."

6670. Will you explain what is meant by that?—All presents made to the Viceroy, and to the Governors in India, are appropriated to the public account. Sales are made from time to time, and this sum represents the amounts received on this account in 1869-70.

6671. This is the gross receipt?—That is the gross receipt.

6672. Would the expenditure appear under the head of expenditure, or under the sub-head of 'repayments, allowance, refunds and drawbacks,' 01,000 *l.*—The payments in purchase of presents will appear under the head of Administration on the other side of the account.

6673. What is the next item?—Fees, fines, and forfeitures, 12,928 *l.*; that includes marriage fees under local Acts, and burial fees, emigration fees, under Act No. 13, of 1864, of the Government of India, and fees for stamping weights.

6674. These are all gross receipts without deduction for the establishments?—Yes, they are all gross receipts. There are certain smaller fees, fees for uncovenanted civil service examinations in Madras, and fees for passports. Those are all included in the 12,900 *l.*

6675. What is the next item?—The next is a casual one, Surplus Revenue of the Straits Settlement, for period prior to April 1867, 4,522 *l.* The administration of the Straits Settlement was transferred to the Colonial Office, from the 1st April 1867, and this represents the amount found to be due to the Government of India in settlement of account.

6676. What is the next item?—The Police Superannuation Fund, 451,211 *l.*

6677. What does that represent?—On the reorganisation of the police force in India, which was first made in the Madras Presidency and afterwards extended (it has been carried out throughout the whole of India), arrangements were made for giving superannuation allowances to the constables from funds to be formed by a tax of half an anna in the rupee of their pay, which is about 3 per cent. There was no definite actuarial scheme ever made for regulating this matter, and it was found after some years' experience that either from constables leaving the force before being entitled to superannuation, or from their being promoted to grades in which they would be entitled, under the Government rules, to pensions without payment (it is the practice of the Government of India to allow pensions to their servants for the most part in receipt of pay of more than 10 rupees a month), the claims on the fund would be small, and it was determined to discontinue the system. The Government took over the corpus of these funds, together with their obligations, and the future pay of the constabulary, it was intended, should be readjusted in accordance with these conditions. The amount in the accounts represents the capital of these funds at the time of their being taken over.

6678. Then this item will not reappear in the accounts?—That will not reappear.

6679. But on the other hand, the expenditure will be increased by the charge for the superannuation?—It was intended that the pay should be readjusted with regard to the condition that the constables would receive pensions.

0.59.

6680. But there will be an item in the account for the superannuation although the sum for the salaries will be less in proportion?—Yes.

6681. Mr. J. B. Smith.] The Government has taken that 451,000 *l.* as income?—Yes.

6682. Chairman.] Do you know enough of the accounts to explain this sum appearing thus, whilst there is a separate item for police of 287,000 *l.* in gross receipts; do you understand what that item is so as to explain why they are not under the same head?—I can explain generally, that that consists of the contribution from municipal bodies for police in order that the accounts may represent the full expenditure.

6683. It represents the municipal contributions throughout India to the charges of police?—That is generally the case.

6684. What is the next item of these miscellaneous receipts?—The balance of the Orissa Famine Fund, that is 29,115 *l.* That is casual, being the amount found to be due to the Government on the settlement of the account.

6685. Repayment of advances of the previous year?—Yes, it is of that character.

6686. What is the next item?—There is a small amount received for the expenses of the preliminary survey of waste lands, 1,689 *l.*

6687. Does that represent all the operations under the appropriation of waste land?—It is the sum deposited by persons intending to take up waste lands to defray the preliminary survey.

6688. What is the next item?—Recoveries on account of law charges, 2,191 *l.*; that represents the recovery of sums advanced for carrying on the suits of persons allowed to sue *in forma pauperis*.

6689. Mr. J. B. Smith.] That 1,600 *l.* for the survey of land was treated as revenue too, I suppose?—Yes.

6690. Chairman.] What is the next item?—The next was the sale of tea plantations, and tea in the North West Provinces, 10,837 *l.*

6691. Is that a casual receipt?—That is casual for the year, and will not reappear.

6692. Sir Stafford Northcote.] Are there many of those transactions of sale?—There have been two or three sales. This is the sale of a tea garden named Kowlagheer, in Dehra Dhoon, in the North Western Provinces, and I am aware that there have been one or two sales of experimental tea gardens in the Kumaon Valley, but that is not related to the accounts of this year.

6693. Chairman.] Those have been carried on by the Government to open up the cultivation of the country?—Quite so, not with a view to profit or revenue.

6694. Mr. J. B. Smith.] In short, they were experimental?—Yes, experimental.

6695. Chairman.] What comes next?—The next item is receipts from experimental cotton factories, 7,157 *l.*; that is purely experimental.

6696. Is that from the sale of the factories?—No; the sale of the produce or receipts in connection with the management of them.

6697. Is that net receipt?—It is the gross receipt. It occurs in the Punjab and in the Central Provinces.

6698. Where does the expenditure appear?—The account has been rearranged, and the expenditure will appear in future under an account of "Minor Departments."

6699. On the other side of the account?—Yes.

6700. There is still a sum of about 145,000 *l.* to account for, to make up the whole item of "miscellaneous"?

Mr.
Harrison.

13 June
1871.

Mr.
Harrison.
13 June
1871.

"miscellaneous"?—There is about 145,000 £.; in regard to that, the accounts are not received from India in sufficient detail, to enable me to give to-day full information, but I find that it includes such items as these: "stoppages from the pay of Government servants in hospital, the sale of cinchona plants in Madras, subscriptions to district gazettes published in the Madras Presidency, receipts from staging bungalows, or rest-houses, sale of elephants attached to the Survey Department; and I have also reason to believe that it includes the balance of a fund for the service of civil court processes in the Bombay Presidency.

6701. May we infer from this that the Government of India has adopted the course that is pursued by the Government here of paying all the receipts in connection with services into the Treasury, and accounting for them as receipts, so as not to deduct them from the expenditure?—That is the case.

6702. And that all these small items that cannot be put under any particular head, go into this general item of miscellaneous receipts?—That is the case.

6703. Can you further explain, with reference to these special services, where you have told us there is a receipt on the one side and an expenditure on the other, such as the military funds and other funds, whether a balance-sheet is made out annually, showing the operation in each particular case, and the result of the operations apart from the ordinary accounts of the Exchequer; that is to say, whether to manifest the character of these operations to the Government, such a balance-sheet is made out?—Not for publication.

6704. But for the Government?—A periodical statement of the obligations of the Government is made out.

6705. To go to particulars, then, under the Act of 1866, the Government assumed the administration of the various military funds; those were separate military funds for each presidency, and even more than one fund in each presidency?—That is the case.

6706. Before those funds were so assumed, the trustees of those funds made out regular annual balance-sheets, did they not, showing the working of them?—Yes.

6707. Has the Government continued those balance-sheets in respect of each of those funds, showing the continued working of them under the Act, and the probable consequences?—Complete accounts are maintained which would show the working of the funds.

6708. But I am asking you whether the Government system has continued balance-sheets of these special operations, so that they manifest themselves from year to year; what is the result?—I can hardly speak to that point.

6709. You do not know that they do?—No.

6710. Then with the 145,000 £., which you have explained, that would make up the whole sum of 1,450,000 £. in round numbers?—Yes; which appears in the account for this particular year.

6711. Mr. Fawcett.] You are the Controller of the Revenue Department of the Government of India, are you not, at Calcutta; that is the especial department to which you belong?—Not for the management of the administration of the revenue.

6712. To control it?—So far as the accounts of the revenue go.

6713. In fact you are summoned here as the representative of the Control Department, are you not?—To give such information to the Committee as is at my command.

6714. You are called as an official witness; I do not wish to put any questions to you which ought more appropriately to be put to another witness, and it would be unfair to you for me to do so; but as you are summoned by the Government distinctly as an official witness, I want accurately to ascertain what particular official department you represent; you represent the Control Department, do you not?—I do.

6715. You can give me some idea as to what the Control Department does; what is the department for?—For the audit in detail of all the civil expenditure, and for the record of all civil revenues.

6716. Then this department would consider it peculiarly and particularly their duty if in this audit they discovered some item put down as income which ought to be put down as capital, to protest, would they not?—Not to protest.

6717. But to point it out?—To point it out.

6718. It would be peculiarly the province of the department to point it out?—I think so.

6719. *Chairman.*] Does the Audit Department in India consider that its primary duty is to see that there is the authority of the Government of India, or of the district government, if necessary, for the particular item that it is called upon to audit?—That is its special duty.

6720. And if it finds, in reference to the item that is presented to it, that there is an authority from the Government for discharging that item, and carrying it to a particular account, then is its duty at an end or not?—It is quite satisfied.

6721. Its real function is to see that every item of expenditure that is brought under its notice is in accordance with the authority either general or special given for that item by the Government of India, or the government of the district?—That is the case.

6722. Mr. Fawcett.] I understand that amongst the Miscellaneous Receipts one of the largest sums, 451,000 £., is put down as Police Superannuation Fund?—Yes.

6723. You say that that item arose from the Government undertaking a scheme of superannuation pensions, and never taking any trouble whatever to consult an actuary as to the charges which ought to be made to carry out that scheme?—No; I cannot infer want of prudent care from an arrangement which has resulted in leaving a very large sum in the hands of the Government, and not in any loss.

6724. But you cannot create money out of nothing, and therefore this large sum of 451,000 £. must have come from somewhere; and what it amounts to is this, as far as I understand it, that owing to the carelessness of the Government in not consulting an actuary, too high a rate was charged for these annuities and pensions, and the consequence is, that this 451,000 £. has been virtually taken out of the pockets of police?—It was the condition of their engagement, their pay being fixed at a certain normal rate, that a certain fixed deduction should be made therefrom.

6725. But the Government never intended to make a profit out of the superannuation scheme, did they?—I presume that it was intended that the

the Government should be secured against loss.

6726. But not to make a large profit?—That was probably not an object.

6727. And they never have consulted an actuary as to the rates to be paid; so you have stated, have you not?—I believe they did not.

6728. I understand you now that the Government is going to increase the pay of the police, and to put them on a new footing?—Rather to decrease the pay, with reference to the prospective advantage of the pension held out to them.

6729. But in order to give them some compensation for that, they are going to raise their weekly pay?—Rather to diminish the pay.

6730. Then do you not think, after your description, that this 450,000 £. being an accidental receipt, which never can recur according to any principles which regulate any private concern, it ought to be put down as capital, and not as income?—The general principle upon which the finance accounts rest is, I think, that they contain a record of everything that is received as revenue, and everything which is paid as expenditure. These receipts represent cash that was actually received, or what was equivalent to a cash receipt, being a deduction from expenditure made at the time of payment.

6731. Of course it is quite right that it should be put down as a receipt, and no one doubts that; but is it a receipt that can be fairly used as income?—There is no distinction in regard to receipts that may be considered as income and distinct from capital. There is no such idea as that of capital accounts in the revenue and finance accounts of the Government.

6732. I presume so, from your evidence; but do you think that any accounts can be satisfactory, or that you can place any dependence upon them, if they have not a capital account to which to appropriate receipts?—A receipt of this character cannot fairly be compared with ordinary expenditure.

6733. Can a receipt at any time be compared with ordinary expenditure; will you explain your meaning more clearly, if you please?—I mean that it is not of a character that is available.

6734. *Chairman.*] You mean that the receipt is not available from year to year for current expenditure?—That is my meaning.

6735. *Mr. Fawcett.*] But do I understand you rightly, that under no circumstances whatever can or would any receipt, from whatever source it is obtained, be devoted to capital; that it would always be spent in income?—I consider that to be the case.

6736. I believe that during the year for which these accounts refer to, a very considerable sum of money was borrowed; you obtained an exceptional receipt, which properly is not income; would it not be fairer, instead of putting down as income, to consider it as so much capital, and by considering it as so much capital, for that reason to borrow less; do not you think that that would be a fairer way of keeping the accounts?—The result seems to me to be precisely the same.

6737. You have described yourself as Controller General to the Government of India, and I suppose you understand that expression to signify that you are not Controller General in any way of the Government of India, or of their financial policy?—Certainly not.

0.59.

6738. There is no Controller General in the sense of controlling or of protesting against their financial policy?—No.

6739. You say, as a matter of fact, that none of these miscellaneous receipts, from whatever source obtained, have ever been devoted to capital or to the reduction of debt; they are always spent as they have been this year, as income?—I can hardly say spent as income; they have been added to and included in the income of the year; but clearly, where it is merely a transfer from an obligation of the Government, there is no such addition to the revenue of the year as is available for expenditure. This does not form a receipt in cash of the year; it is a reduction from the obligations. In the case, for example, of this Police Superannuation Fund, a portion of it will be found as a reduction from the head of "Treasury Notes bearing Interest," which appears in the finance accounts, and is therefore a discharge of debt; it is applied, I may say, in that sense, to the reduction of debt.

6740. Is any account kept, so that an annual record is produced of what amounts and what particular sums are devoted in this way to what you have described as a virtual reduction of debt?—Returns are from time to time made of the amount of the obligations of the Government, which, in effect, are, I think, what you refer to.

6741. But could I, for instance, discover, or could any Member of the Committee discover, from the accounts placed before Parliament, how much of this 451,000 £. has been devoted in the way you describe to the reduction of debt?—I think that can only be inferred from the result of the account, as showing a surplus of revenue on the expenditure or otherwise.

6742. But how could you discover it from that?—Well, if half a million of this kind is added to revenue, and the result is an exact equilibrium, I should say that there was a virtual deficiency in the year's revenue to that extent.

6743. You would say that that was the proper way of describing the financial position of India for that year?—On those data.

6744. How much, for instance, has been devoted in the accounts which are before us in this way, so as to produce this equilibrium?—It is not accurate, I think, to say that these sums have been so placed in order to produce an equilibrium; and, on the other hand, some large amounts of a very similar character will be found upon the other side of the account in expenditure. That is not a matter which, as I understood, the Committee wished to inquire into at the present time; but I may mention shortly, that large amounts from the irrecoverable debts of the Port Funds at Port Canning, Calcutta, Moulmein, and Bassein, were written-off the accounts of this year by being included in the account of expenditure.

6745. As it is the feeling of the Committee that we should not now enter into questions of expenditure, we will assume that certain amounts have been put down to expenditure which represent exceptional expenditure. Then for a moment directing your attention to revenue, can you state how much has been devoted in the manner you indicate to produce an equilibrium, which you consider is of an exceptional kind of income, that ought properly to be stated to represent the deficiency in the income?—I should specify the following items: capital of police superannuation funds, 455,211 £.; payment made by the Maharajah Holkar in capitalisation of tribute, 107,168 £.;

R R 3

and

Mr.
Harrison.

13 June
1871.

Mr.
Harrison.
—
13 June
1871.

and accumulated receipts from the sale of waste lands, 416,614*l.*; that amounts to 974,993*l.*

6746. Then, according to the description that you have previously given, an equilibrium in the expenditure and revenue having been obtained by devoting such items as these to revenue, you would say that the financial position of India was accurately described by saying that there was really a deficiency of 974,000*l.* and odd, unless there was exceptional expenditure?—Which on this occasion there is; I cannot leave that out of sight.

6747. *Chairman.*] What is the amount of exceptional expenditure in the gross?—The amount of such exceptional expenditure I take to be 364,746*l.*

6748. *Mr. Fawcett.*] Then, according to your figures, the net amount of this exceptional kind devoted to income is rather over 600,000*l.*?—£. 610,247, taking the figures that I have given.

6749. This refers to the year 1869–70, does it not?—Yes.

6750. In that year the financial minister stated that there was a surplus of 150,000*l.*, did he not?—£. 118,000 it was stated; but the character of it, I think, was fully laid before the public.

6751. Therefore you would consider that a more correct description, considering this appropriation of exceptional receipts of the financial position of India, was to say that during the year 1869–70 there was not a surplus of 118,000*l.*, but a deficiency of rather more than 500,000*l.*?—It would require a careful review for me entirely to assent to that, but I think that is the case.

6752. And I suppose that the financial position of India, in many other years besides 1869–70, in consequence of the appropriation of exceptional receipts, would have to be corrected in the manner just indicated, would it not?—I am not prepared to say.

6753. But from your knowledge of the finances of India, I suppose it has not happened that this is the only year when large exceptional receipts, such as those that you have described, have been devoted to income?—I am not prepared to say what has been the general effect of such transactions; there have been transactions of a similar character.

6754. In many previous years?—I hardly think that can possibly be the case, for these receipts from their nature are not capable of recurrence.

6755. With regard to what is put down as the receipt under the military funds, 244,000*l.*; I understand from your description that that receipt really represents an operation which has been described as discounting the future, that the Government is not providing at the present time for increased charges which they will have to meet?—That is the effect.

6756. Therefore properly, according to principles of sound finance, they ought to be at the present time spending more on these military funds than they actually are, ought they not; in fact they spending their capital, are they not?—Yes; I think that is true.

6757. They are spending this capital at the rate of something over 100,000*l.* a year, are they not?—The amount is this sum of 244,000*l.*

6758. So that really the sum of 244,000*l.* represents not any actual revenue, but simply indicates, as it were, and is a measure of, the prodigality of the Government in spending their

capital; is not that the case?—I cannot accept that view of it.

6759. I will put the question in another way; this 244,000*l.* represents an appropriation of capital; the income arising from that capital represents a certain charge which the Government has to bear; therefore, when they have exhausted their capital, they will have to provide for this charge out of the ordinary revenue of the country, will they not?—That is the case.

6760. *Mr. J. B. Smith.*] Supposing that it be as *Mr. Fawcett* states, is it any part of your duty as Controller, to point out these things to the Government; do you consider it merely your duty to obey orders of the Government, or to point out from time to time when you think sums are improperly appropriated?—It is no part of my duty to protest or remonstrate on the action of the Government.

6761. But merely to carry out their orders?—Merely to carry out their orders.

6762. *Mr. Fawcett.*] I simply wanted your opinion as the opinion of a great authority on the point; you cannot say that this spending of capital is proper; you simply, by such system, relieve the present generation at the expense of future generations, do you not?—I cannot answer that.

6763. But we are distinctly to understand that the Government is spending the capital from which certain charges are to be provided, and when the capital is exhausted, they will have to provide for the charges out of ordinary income?—That is the case; but it must not be left out of sight that they will in effect have had the use of this capital without charge for interest during the time that it is in the process of exhaustion.

6764. But still that does not alter the fact, that when the capital is exhausted, which in the case of the Bengal Military Fund you say will be in seven years, the annual charge to be borne by the ordinary revenues of the country will be increased?—Yes, it will.

6765. Is there anything in these accounts to show, for instance, with regard to an item such as the 7,000*l.* derived from the experimental cotton manufactories, at what expense that income was obtained?—I can state generally the expense; the expense is not deducted from receipt, but appears on the other side of the account.

6766. Without going into the item of the expense, is it distinctly stated what the expense is in a separate sum, so that anyone looking through the account can balance one against the other?—I think the account as laid before Parliament is in too abstract a form to show that, but the particulars and the information are readily available.

6767. But they are not available from the Papers laid before Parliament?—At page 38 of the Accounts, you will observe, under the head of "Bombay and Scinde," "Cotton Commissioner, 2,276*l.*," and under "Central Provinces," in the previous page, "Cotton Commissioner, 2,800*l.*" Those sums, I think, represent the corresponding expenditure.

6768. When you say that the accounts are not given in sufficient detail, do you mean that the revenue is lumped in one sum, and the expenditure is lumped in different sums, and therefore you cannot tell anything about the financial success or failure of any particular one of these experiments; that is the defect in detail to which you allude, I presume?—For the purpose of determining

termining such success or failure I think it would be necessary to state a separate account. I hardly think it would be practicable that such a result should be brought out in this statement.

6769. Do not you think that it would be useful to prepare these balance sheets, which you say are not prepared, so that, for instance, at once information should be readily obtained as to the financial loss or gain of any such experiments as these?—It would be useful.

6770. And you would recommend the keeping of such balance sheets?—I think it might be done in regard to many branches.

6771. There is a small receipt for Durbar presents as you stated; is it customary to sell all that are received?—Some are employed to be given as return presents.

6772. But it is not usual for any to be kept as private property?—No.

6773. Mr. *Beach*.] The Committee must infer from your evidence that these miscellaneous receipts in future years are likely to fall off?—Yes.

6774. Mr. *Eastwick*.] With regard to these funds, you stated that the disbursements would go on for a century, and you spoke of the children; but the female children cease to receive anything on marriage, do they not?—Yes.

6775. And the male children at the age of 21?—Yes.

6777. Did not Sir Richard Temple, in the Budget of 1869-70, especially speak of these miscellaneous receipts as great "windfalls," without which the receipts on revenue would have been much reduced?—Yes.

6777. He spoke of them distinctly as exceptional things, and not likely to recur?—They were noticed in those terms.

6778. *Chairman*.] We will now go to the miscellaneous military receipts; there is an item of "Army, miscellaneous," 1,082,605 £; will you be good enough to state what that item is composed of?—The accounts showing that in detail are not immediately available, and therefore I am obliged to speak from the estimate only; the estimate of military receipts for the year 1869-70 was 729,702 £.

6779. Will you explain what the heads of receipt are which make up this total?—Taking them from the estimates of the year there was expected to be received on the grant for regimental pay 11,240 £; the purchase-money paid for discharge, and unclaimed balances of deserters. On the Commissariat grant the following receipts were expected: 51,800 £ from sale of Commissariat provisions and stores; 317,500 £ from proceeds of sale of malt liquor.

6780. Do you mean malt liquor sold to the troops which had been bought by the Government?—Bought in England by the Government and sold to the troops, and there was expected to be received from the sale of spirits, rum, and arrack, 96,000 £.

6781. That being bought in the same way by the Government?—Bought by the Government, but for the most part in India.

6782. And re-sold to the troops?—Yes.

6783. When you speak of the re-selling to the troops, do you mean that that is part of their ordinary rationing, or is it sold in canteens?—It is sold in canteens; it is sold by the Commissariat Department to the regimental canteen.

6784. That is quite independent, then, of the ordinary pay and allowance of the troops?—Quite so. Then from Commissariat cattle 0.59.

5,400 £ was expected to be received, and from miscellaneous receipts in the Commissariat Department, 11,000 £.

6785. What is the next item?—The Stud Establishments, 33,920 £; the sales of stud cattle, the sales of regimental cast horses, and amounts received from officers for chargers supplied.

6786. We understand that this is the gross receipt, and that all the expenditure of such establishment goes under the head of Charges for the Army on the other side of the account?—Yes.

6787. And the same with regard to the previous item of the purchase of liquors?—The same is true of every part of the military receipts.

6788. Then the next item is what?—Clothing Establishments; there is a return there of 40,090 £.

6789. What is that?—I cannot speak positively to it, but I understand it to be clothing supplied for the most part to other departments of the Government; to the police, for instance, being clothing made up by the clothing agencies of the Government.

6790. A military clothing agency?—Yes; so that it is more a matter of account than any real return.

6791. But do some of these receipts come from local funds, municipalities or others?—That will probably be the case. It may also be on account of the police, paid from the revenues being for supplies from the Military to the Civil Department.

6792. To adjust the accounts between the Civil and Military Departments?—Quite so.

6793. What is the next item?—Under the head of Barrack Establishments there is a return of 6,755 £. It is for sale of barrack and hospital furniture and recoveries for damaged furniture. Under the head of Administration of Martial Law there is a receipt of 2,400 £, which consists of the receipts from regimental and garrison prison funds.

6794. That is also a gross receipt?—That is a gross receipt. Under the head of Medical Establishments there is a return of 22,900 £, that consists of the stoppages for men in hospital, but includes also the sale of medical stores; and this again will be in great measure for medical stores supplied to the Civil dispensaries; some on payment and some not. Some of them will be paid from charitable dispensary funds, and some will be merely an adjustment of account between the Civil and the Military Departments. Under the head of "Ordnance Establishments" there is a return of 108,970 £.

6795. What is that from?—Sale of ordnance stores and camp equipage and miscellaneous receipts of that branch. Under the head of "Education" there is a small receipt of 437 £. It appears to be receipts of damaged library books of regimental libraries, and receipts of that character. Under the head of "Sea Transport Charges" there is 3,580 £ table money, which officers have to pay.

6796. That is, they repay to the Government the expense of their table when they are being conveyed?—That is the explanation of it.

6797. What is the next item?—It is described as "Miscellaneous," and it is 17,415 £, which consists of such miscellaneous receipts as amounts forfeited by contractors, and it also includes, though it is not an important item, the gain by exchange transactions with London; that occurs

Mr.
Harrison.

occurs only in this way: the soldiers' pay is uniformly converted in India at the exchange of 2 s. 0½ d. the rupee; this rate of exchange is ordinarily to the advantage of the soldier. In the case of his family remittances to England, and remittances of savings bank balances, he gets the advantage of that rate involving a loss to the Government, which appears on the other side of the account; but in certain cases the gain is on the side of the Government, as in the case of the transfer of a regiment to India; the amount of the regimental savings bank balance is placed to the soldiers' credit at that exchange of 1 rupee for every 2 s. 0½ d., being then to the disadvantage of the soldier; and this small gain, for it is not at all important, comes into this head of account.

6798. Mr. *Fawcett*.] How much is that item?—I think the military estimates will state that (*the Witness turns to them*). It is 100 l. only for the Bengal Army, and Madras, and Bombay, will probably amount to about as much; about 200 l. in all.

6799. *Chairman*.] Are those all the several heads of receipt with which you are acquainted under this item?—That is all.

6800. You cannot tell us exactly how it was increased from the estimate of 729,000 l. to the actual receipt of more than a million?—No information has been received in this country; and I am unable to speak to that at present.

6801. Do you know whether it is the practice of the Government to have balance sheets made out of any of these transactions, such for example as the canteen transactions, which show whether they make a profit or loss on the whole business?—I think that full information is available.

6802. But is it the practice to have an annual balance sheet made, to exhibit at a glance to the Government what is the result of their operations?—No, I think not; not in that form.

6803. That applies to all these operations, detached from the general business of the Government, such as supplying the canteens with beer or with spirits?—I think that the results of these operations are fully known.

6804. But still there is no system of extracting from these accounts the whole operation, so as to show exactly what is the general effect?—There are no regular stated accounts.

6805. Do these items appear regularly in the military receipts from year to year, so as to be a system of military receipt, or do you consider any of these casual?—No, I think that the whole may be considered as of an ordinary and recurring character.

6806. Mr. *Bourke*.] Ordinary in amount, do you mean, or in character?—Ordinary in character.

6807. And the amounts would be on an average about what they were last year, I presume?—Yes, I think they will average about the amount in the Estimates for 1869–70.

6808. There is one item put down "commissariat sales," 50,000 l. odd?—Yes.

6809. Is that usual, or was it more last year than most years?—The amount taken in the sum which I have stated as the proceeds of sale for the Bengal Army is 30,000 l. The actual amount in the previous year which is available, was 39,583 l., not very widely different.

6810. That represents, I suppose, things that have been bought in excess of the wants of the army, and sold afterwards?—No, I think that for the most part, it will be of the same character that I

was explaining in regard to some other items, an adjustment of account between the different departments of the Government being for stores supplied by the Commissariat possibly in some cases to ships of Her Majesty's Navy, and in other cases to different branches of the Civil Department of the Government.

6811. And would those moneys that have been received back or expended, be shown on the other side of the account?—That would be so.

6812. Mr. *Fawcett*.] You say that the items which you have described, which amount to 700,000 l., may be described as ordinary military receipts, do you not?—I meant to say that there appears to me to be nothing extraordinary in the receipts of this year, that receipts of the same character may be expected to occur from year to year.

6813. Of the same character, and of about the amount?—Yes.

6814. That refers to the items which you have gone through, amounting to 700,000 l., does it not?—That is so.

6815. But then the actual military receipts this year, according to that description, amount, not to 700,000 l., but to 1,060,000 l., which represents something very extraordinary, does it not?—The estimate is based upon the expectation of the ordinary receipt, and I therefore consider that the amount estimated may be considered to represent what, under ordinary circumstances, would occur.

6816. From the figures before us it appears that in 1869–70, when the revenue only just balanced the expenditure, there was an exceptional military receipt of nearly 300,000 l.?—The receipt exceeded the estimate by about that.

6817. You cannot give us any information as to how that arose?—The information is not immediately available.

6818. Can you give us any general idea?—No.

6819. When will the information be available?—It could readily be obtained on reference to India.

6820. With regard to some of these receipts, for instance, the receipts from stud establishments, you of course, in the Control Department, must know at what expense that receipt has been obtained?—If you appeal to me personally, I do not, for the administration of the Control Department for the military is distinct.

6821. But still there is some department of the Control Department which knows exactly at what expense that revenue has been obtained?—Certainly.

6822. Suppose they thought that the revenue was too small, or too small in proportion to the expenditure, would they think it their duty to protest?—It is not a department of revenue in any sense whatever.

6823. But who would be able to exercise that control?—It is under the administration of the Commissariat Department; the Commissary General.

6824. But then, as a matter of fact, I am to understand that the Commissary General is under no control?—I do not understand that he is relieved from all superior control.

6825. But, for instance, supposing that a revenue of 30,000 l. had been obtained in the Stud Department by an expenditure of 35,000 l., and that, if the thing had been properly managed, the revenue, instead of being 30,000 l. would have been 50,000 l., whose duty would it be to point that fact out to the Commissary General; would it

it not be the duty of the Control Department?—The Commissary General has the information at his command.

6826. But supposing the Commissary General did not (as the Commissary Generals sometimes do not) manage his affairs perfectly, is there any one to control him?—He is responsible to the Government.

6827. But there is no particular Control Department that controls an expenditure or a revenue like that?—No department independent of the Government.

6828. *Chairman.*] To whom does the Commissary General report; do you happen to know that?—To the Government.

6829. Is it direct to the Military Secretary of the Government?—Direct to the Military Secretary of the Government.

6830. *Mr. Fawcett.*] But I understand that the Control Department does not exercise any control, as its name implies that it does, over the expenditure and the revenue?—The Control Department exercises no control whatever independent of the Government.
